With Mac OS 8.1 and later, Mac OS can support both Mac OS Standard and Mac OS Extended formatted volumes. Mac OS Standard formatted volumes are sometimes called HFS volumes. Mac OS Extended formatted volumes are sometimes called HFS Plus volumes. Users can tell how a volume is formatted by selecting the volume in the Finder, and choosing Get Info from the File menu. The type of volume appears in the Format field.

Most HFS Plus volumes, including those created by Drive Setup and the Finder's "Erase Disk..." menu item, are really a type of hybrid. They are a HFS volume with a "pure" HFS Plus volume occupying most of the space on the HFS volume. The HFS volume is "wrapped around" the real (embedded) HFS Plus volume. That's why it is called a HFS wrapper. The HFS wrapper is not a separate partition, and both the HFS wrapper and the "real" or "pure" HFS Plus volume inside it are in the same partition, assuming the disk actually uses partitions.

The HFS wrapper functions

- It allows Mac OS 8.1 and later to start up from a HFS Plus formatted volume. The ROM of every computer shipped since the Mac Plus could recognize and mount HFS volumes, but not HFS Plus volumes. This means the ROM sees the HFS wrapper as an ordinary HFS volume, mounts it, and tries to start up from it. To make that happen, there is a tiny System file in the wrapper that contains just enough code to find the real System file in the embedded HFS Plus volume, and continue starting up from there.
- There is a Read Me file in the wrapper. The name is normally "Where_have_all_my_files_gone?". If a user tries to mount the volume on a system without HFS Plus support, anything before Mac OS 8.1, this is the only file visible. It is a SimpleText file that explains that this is a HFS Plus volume, and that they need Mac OS 8.1 or later to use the volume. This was designed this way to prevent the "This is not a Macintosh Disk. Do you want to erase it?" alert users would otherwise see.

In some cases, Disk First Aid 8.2 and later may report the following error message:

"The HFS wrapper partition is damaged. You should make backup copies of your files, erase the volume, and restore."

Disk First Aid can and does fix some kinds of damage to the HFS wrapper. Users should only see the above message if Disk First Aid could not fix the damage. If the error message appears everytime Disk First Aid is run on the volume, back up any important files, erase the volume and restore the software.

Although this type of damage is rare, the HFS wrapper can be damaged by having power removed from the computer when it is in use or after a crash when using incompatible software.

Mac OS X Server 1.0: About Macintosh Manager

This document contains late-breaking information that supplements the information in your installation manual and Macintosh Manager Help.
This article has been archived and is no longer updated by Apple.

Installing Macintosh Manager Software on a Macintosh That Starts Up Locally

You can use the Macintosh Manager Installer to install client software or Macintosh Manger administration software on a Macintosh computer that starts up locally. The computer must meet the minimum system requirements for the software you are installing.

System Requirements for a Macintosh Manager Client Computer:

- Mac OS computer 68040 processor or later
- Mac OS version 8.1 or later
- 8 MB RAM (physically installed, not virtual memory)
- 2 MB hard disk space
- Appearance control panel 1.0.1 or later
- Ethernet networking set up

System Requirements for a Macintosh Manager Administration Computer:

- Macintosh PPC computer
- Mac OS version 8.5 or later
- 800 x 600 resolution display or better
- 16 MB RAM (physically installed, not virtual memory)
- 2 MB hard disk space (Additional space required on server for databases and preferences - possibly up to 4 MB)

Installing Macintosh Manager Software

To install software on a local-startup computer, follow these steps:

1. Start up the computer you want to install the software on.

2. Use the Chooser to mount the NetBoot server volume.

When you log in to the server, use any user name and password that has read access to the NetBoot server volume. For example, you can use the name "Administrator" and the password you set up for the Administrator of the Mac OS X Server.

3. Locate the Macintosh Manager Installer folder and open it.

4. Double-click the Installer icon.

5. Follow the onscreen instructions to install the appropriate software.

Once the software is installed, the computer restarts automatically.

If you're using AppleTalk, when the computer restarts it tries to locate and connect to a Macintosh Management server. It connects to the first one it finds in the local AppleTalk zone. If the computer finds a server, a log-in dialog box appears. A user logs in with a user name and password created with the Macintosh Manager software.

If you have more than one Macintosh Management server on your network or if you have an IP-only network, you may need to use the Server pop-up menu to choose a Macintosh Management server. If the server is not in the same AppleTalk zone as the computer, you use the Other menu to locate the server.

If you need to locate the server using an IP address, you can type either the IP address of the server or the domain name. To use a domain name, there must be a Domain Name Server (DNS) server connected to the network

Updating from At Ease for Workgroups Version 5.0

Important: If you've already set options in Macintosh Manager, the settings are deleted when you update From At Ease to Macintosh Manager.

The following items are not updated, or are partially updated, from At Ease to Macintosh Manager:

- Approved desktop printers for each workgroup: You will need to setup the desktop printers for all your workgroups after updating.
- Printer quota accumulations: All user printer usage counts are reset.

- Activity log: Macintosh Manager starts with an empty log.
- Automatically-mounted servers and desktop printers: At Ease 5.0 supports 32 "auto-mount" servers and 32 "approved" desktop printers. However, Macintosh Manager only supports ten servers and ten printers, so only the first ten of each will be used.
- Special folders: Macintosh Manager only supports one "special folder", whereas At Ease 5.0 supports ten. Only the first "special folder" will be used by Macintosh Manager.
- Workgroup Items: If the icons for a workgroup don't show up after updating, remove the item and then replace it. Any workgroup items, such as applications, found missing on a client workstation after the user logs in may show a standard document icon instead of its normal icon.

Macintosh Manager does not support these At Ease 5.0 features:

- preventing users from starting up from a floppy or other hard disk to bypass security
- Web access to user's documents
- eMate preference configuration
- customized startup pictures for the log-in screen

The steps you follow to update settings depends on when you plan to use the At Ease server as the Macintosh Management server, or a different server.

Updating At Ease 5.0 Settings to the Macintosh Management Server:

1. Make sure no users are connected to the At Ease server. Turn off AppleShare on the At Ease Server.

You should make back up copies of the files in case the updating doesn't work properly.

2. From your At Ease server, mount the volume which contains the Macintosh Manager folder and copy the At Ease Items WG 5.0 folder into the Macintosh Manager folder.

3. Copy the At Ease Server Prefs file from the At Ease server's Extensions folder into the At Ease Items WG 5.0 folder you just copied into the Macintosh Manager folder.

4. Log in to a client computer. Then open and log in to Macintosh Manager.

You are asked if you want to update from the At Ease settings in the Macintosh Manager folder.

5. Click Yes to update.

Updating may take several minutes.

User Information Not Synchronized

Macintosh Manager and Mac OS X Server each have a database that stores user information. When you create a user in Macintosh Manager, Macintosh Manager creates a user in each database. However, no attempt is made to synchronize the users in each database. If the administrator changes a Mac OS X Server user account (for example, by using Network Manager) then information between the two databases may be inaccurate. In most cases this won't present a problem because Macintosh Manager uses information from its own databases.

Logging Into Macintosh Manager: Administrator and "root"

The user name "root", along with the appropriate password, can always be used to log in to the administration application. The user name Administrator is an alias for the user name "root." If you change the alias, you will not be able to log in with the user name Administrator.

Using More Than One Macintosh Management Server, or Using a Macintosh Management Server Located in a Different AppleTalk Zone

If your Macintosh Management Server and NetBoot client computers are located in different AppleTalk zones, or you have more than one Macintosh Management Server in your current AppleTalk zone, you need to set up the Macintosh Manager Preferences file so it remembers the location of the server. Otherwise, your users will need to locate and choose a Macintosh Management Server each time the computer is restarted.

To set up the Macintosh Manager Preferences file so it remembers the location of the server:

1. Start up a client workstation and log in to the System Access workgroup, making sure the proper server was selected in the Log In window. The Macintosh Manager Preferences file on your client workstation will now remember the current server.

2. Take the Macintosh Manager Preferences file and copy it to another location, such as another server volume temporarily.

3. Copy this preference file into the Macintosh Manager Items folder located in the NetBoot System Image. (See the NetBoot Desktop Admin Read Me for instructions on modifying the NetBoot System Image.) You may need to create a Macintosh Manager Items folder if there isn't one.

The file you saved into the NetBoot's system image's Macintosh Manager Items folder (located in the System Folder). You may need to create a Macintosh Manager Items folder if there isn't one.

Preventing Users from Overwriting a Read-Only File

Even though users may not have permission to save a document to a folder, if the user is allowed to open the document, it may be possible for them to use an application's Save command to overwrite the file. To prevent users from overwriting a file, you can lock the file. To lock a file:

1. From the Finder, click the file's icon.
2. Choose Get Info from the File menu.
3. Select Locked.

If Copying Seems Slow

In general, copying files on a computer that uses Macintosh Manager is slower than copying on a computer that uses Mac OS version 8.5 or later, and doesn't have Macintosh Manager installed. This is due to Macintosh Manager security features.

Shared Folders' Names

The Volume Shared Folder in Macintosh Manager is actually named "Global Shared f", and the Workgroup Shared Folder is named "Group Shared f" on the client workstations.

Shared Folders in Restricted Finder and Unrestricted Finder Environments

Unrestricted Finder workgroups always have access to global and workgroup shared folders. These folders are located in the User Documents folder.

If a user opens a volume or workgroup shared folder that the user should have write access to and sees an icon that indicates the folder is read-only, close and then open the window. The read-only icon should disappear.

Printing and Restricted Finder Workgroups

You cannot delete print jobs from the desktop printer.

System Access Workgroup Settings

In general, most settings that you save under this workgroup do not get saved and restored on a NetBoot client computer because the system volume is read only. This includes the printer set in the System Access workgroup.

NetBoot Client Issues

Because Macintosh Manager only preserves files in certain locations when users log out, it's possible for a user to save a document to a disk and have it available to other users when they log in later on. Users should save documents only to their User Documents folder to avoid this problem.

Items saved to the system startup volume are available to users until the computer is restarted. When the computer is restarted, the items are deleted. If you want items to be preserved, you must set the appropriate options in Macintosh Manager.

If a NetBoot client computer shuts down unexpectedly, the preference files may not be saved.

Macintosh Management Server creates a sharepoint on the Mac OS X server called Macintosh Manager. The sharepoint looks like a shared folder and contains the User Documents folders and the Macintosh Manager Items. If a user has access to the Chooser, they can mount the Mac OS X server and access portions of the server volume in addition to the sharepoint.

Application Preferences

Application preferences are only saved if the file has changed. A file is changed if either the modification date or the file size changed while the user was logged in.

If you find your users are saving too many preferences, you should consider adding some preference files or folders to the list of exceptions in the administration program. Files added to the exceptions list are not be saved or restored when the user logs in or out, greatly increasing the login or logout speed. As an alternative, you can specify only certain files and folders you want to save and restore. This allows you to be selective in what a user preserves. See Macintosh Manager Help for more information.

A folder called MM User Default Prefs is automatically created in the Macintosh Manager Items folder on the server. You can put preference files or folders in here that they want a user to obtain the first time they log in. This folder is used if, and only if, there is no preference folder stored on the server for that user. The user's preferences are stored inside the MM Users folder on the server under a folder named by the user's name and the suffix "Prefs"

Once the user saves preferences to the server and creates a preferences folder, then the Default Prefs folder will not be accessed by that user.

Preserving Information About Open Windows

You can set options in Macintosh Manager so that information about open windows are saved from one session to another. If information about open windows are preserved, the windows that are open when a user logs out, are open when the user logs in again.

To preserve information about open windows, do this:

1. Open Macintosh Manager.
2. Click the Workgroups tab, then click the Options tab.
3. Choose Everything or Applications Preferences Only from the "Preferences to preserve" pop-up menu.

If Your Macintosh Manager Icons Don't Show Up Properly

If you have installed a previous version of At Ease for Workgroups on your client computers, your Macintosh Manager icons may be incorrect unless you rebuild your desktop. This can be done by holding the Command and Option keys down when entering the Finder.

If Printing Quotas Don't Seem to be Working Properly

Printing quotas are not enforced if the desktop printer name does not match the printer set up by the administrator for the workgroup.

Apple Software Restore: Some Preferences May Be Lost

This article lists the software that is replaced when performing a "Restore in Place" with Apple Software Restore.

This article has been archived and is no longer updated by Apple.
When using Apple Software Restores (ASR) to perform a "Restore in place," the utility replaces only your original software (original system software, factory settings, and applications that came with your computer) with new copies from the Software Restore CD, leaving everything else on your disk untouched. ASR copies files from a Disk Copy disk image located in the Configurations folder on the iMac Software Restore CD.

Since ASR does not check for versions of software installed, it is possible for ASR to replace same name system software components with older versions. For example, users having installed the ATI Video Software Update may need to reinstall the update after performing a "Restore in place" with ASR.

Although most preferences are not affected by performing a "Restore in place," there are a several preferences you might want to save before using the Apple Software Restore. Saving these preferences avoids having to reconfigure important settings for Internet access, email and web browsing. Consider saving the following preferences, out of the Preferences folder, in the System Folder, into a separate folder or onto the Desktop before choosing "Restore in place":

Note: You may want to consider saving the entire Preferences folder, as this will save all preferences. Doing this will assure you have any Apple, or third-party preference files.

- Airport Prefs
- AMD Database
- AppleTalk Prefs
- ASLM Prefs
- Internet Prefs
- Modem Prefs
- Palm Desktop Info
- Quicktime Prefs
- Shockwave Prefs
- TCP/IP Prefs
- Explorer Prefs
- Extensions Manager Prefs
- Keychains Prefs
- Printing Prefs
- Total Access

This means many Internet settings may be lost when performing a "Restore in Place." To avoid having to reconfigure your computer to access the Internet, the TCP/IP, Modem, and Internet Preferences should be dragged out of the Preferences Folder (in the current System Folder) and placed on the desktop so that they can be placed back in the Preferences Folder after the Restore is complete.

Another concern would be the America Online and Explorer folders in the Preferences Folder. The Explorer folder contains the "favorites.html" file that stores all the favorites that have been saved in Microsoft Internet Explorer. The America Online folder contains the "AOL External Prefs" which contains the connection settings for America Online. If America Online and Internet Explorer are commonly used for Internet access, these folders should be saved into a separate folder or onto the desktop before performing the Restore, and then placed back in the Preferences Folder after the Restore is finished.

Notes:

1. If your computer came with both Mac OS 9.1 and Mac OS X installed on the hard disk, you should follow the restore procedure outlined in Article 60847 "Apple Software Restore: How to Perform a Multiple Disc Restoration"

2. This article also applies to the Power Macintosh G3 (Blue and White); the same preference files are affected.

3. Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Mac OS Runtime For Java 2.1.4: Read Me

This article comprises the Read Me for Mac OS Runtime for Java (MRJ) 2.1.4. This software was released by Apple on 11 August 1999, and is available for downloading from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Description
Mac OS Runtime for Java (MRJ) 2.1.4 is an upgrade to MRJ 2.1.3. It fixes two severe bugs that affected Java applications, but not applets.

- In some Java applications, windows would occasionally disappear or become non-functional.
- Quitting a Java application would occasionally cause another application to quit, or a file opened by another application to close. This would happen only when the second application had been launched, or the file opened, after MRJ opened a window.

This release is Bronze certified for running applications built with Oracle Developer 1.6.1 and deployed on Oracle Developer Server using Apple Applet Runner 2.1.4.

Requires
Mac OS 7.6.1 through Mac OS 8.6, QuickTime is recommended.
This article has been archived and is no longer updated by Apple.
About Mac OS Runtime for Java 2.1.4

Mac OS Runtime for Java (MRJ) 2.1.4 is an upgrade to MRJ 2.1.3. It fixes two severe bugs that affected Java applications, but not applets.

- In some Java applications, windows would occasionally disappear or become non-functional.
- Quitting a Java application would occasionally cause another application to quit, or a file opened by another application to close. This would happen only when the second application had been launched, or the file opened, after MRJ opened a window.

This release is Bronze certified for running applications built with Oracle Developer 1.6.1 and deployed on Oracle Developer Server using Apple Applet Runner 2.1.4.

Known Issues

- **Java Epoch Date:** Java's internal clock calculates dates as the time since January 1, 1970. If the system clock on your Macintosh is set to an earlier date, Java applets and applications may hang or exhibit other unusual behavior. Ensure that the current date in your Date &Time Control Panel is at least 1/1/70.

About Mac OS Runtime for Java 2.1.3

Mac OS Runtime for Java (MRJ) 2.1.3 is an upgrade to MRJ 2.1.2 that addresses several memory and applet security issues. This release is Bronze Certified for use with Oracle Developer 1.6 using Apple Applet Runner 2.1.3. For details on Oracle Bronze Certification, see **http://www.apple.com/java/**. This version of MRJ installs Apple Applet Runner 2.1.3, a utility for running Java applets outside of a Web browser. Apple Applet Runner is installed in the Mac OS Runtime for Java folder inside your Apple Extras folder. See "About Apple Applet Runner" for more details.

About Mac OS Runtime for Java 2.1.2

Mac OS Runtime for Java (MRJ) 2.1.2 is an upgrade to MRJ 2.1.1 that addresses several general Java security problems reported to us by Sun Microsystems, and fixes a number of outstanding developer issues.

About Mac OS Runtime for Java 2.1.1

Mac OS Runtime for Java (MRJ) 2.1.1 is an upgrade to MRJ 2.1 that updates JDK compatibility and addresses a number of outstanding issues from previous releases of MRJ. The major changes include:

- MRJ 2.1.1 is compliant with Sun Microsystem's Java 1.1.7 specification.
- MRJ 2.1.1 (English) can now be installed on all language versions of the Mac OS. See the note "For International Users" below for more information.
- MRJ 2.1.1 now correctly handles loading applets through a proxy server or firewall.
- Applets in the games section on Yahoo now display and work correctly.

TA25316_Mac_OS_Runtime_For_Java_Read_Me.pdf

About Mac OS Runtime for Java 2.1

Introduction

Mac OS Runtime for Java (MRJ) 2.1 is Apple's implementation of the Java Virtual Machine (JVM), based on Sun Microsystems' Java 1.1.6 specification. MRJ allows you to run Java applications and applets. (Running applets also requires a Web browser, such as Microsoft Internet Explorer, or an applet viewer such as the Apple Applet Runner.)

MRJ 2.1 makes many improvements over Apple's previous JVM, including greatly increased performance, improved reliability, and support for AppleScript and Sun's JFC/Swing. MRJ 2.1 also runs more applications and applets than earlier versions.

For the latest developments in Java for the Macintosh, see Apple's Java Web site at http://www.apple.com/macosx/features/java/

Configuring Your Web browser

Mac OS versions 8.0 and later come with a copy of Internet Explorer configured to work with MRJ. If you're using a different browser or if you got Internet Explorer from another source, you may need to configure it to use MRJ.

Note: Versions of Netscape Communicator/Navigator up to and including 4.5 use their own internal Java Virtual Machine and cannot be configured to use MRJ. Apple and Netscape are working together to develop a future version of Netscape Communicator/Navigator that will make use of MRJ. For more information on Netscape's browsers, you can monitor their Web site at http://home.netscape.com/computing

To configure Internet Explorer to use MRJ, choose Preferences from the Edit menu. In the Java Options section, make sure Java is enabled and Apple MRJ is selected as the Java Virtual Machine. To make your changes take effect, quit the browser and open it again.

Minimum System Requirements:

- Macintosh computer with a PowerPC processor
- System 7.6.1 or later
- 24 megabytes (MB) of RAM. For better performance, 32 MB of RAM is recommended, with virtual memory turned on and set to at least 33 MB. Installing more than 32 MB of RAM will greatly improve performance and increase the number of Java applets and applications that can run simultaneously.
- at least 20 MB of free disk space
- Using Java applets over the Internet requires Open Transport 1.1 or later and an active Internet connection.
- You may experience improved performance if you have QuickTime 3.0 installed. QuickTime 3.0 is installed with Mac OS 8.5, or you can download it at **http://quicktime.apple.com**.

Files Installed With MRJ 2.1

In the Extensions folder (inside the System Folder):

- MRJ Libraries folder, containing MRJ Lib, MRJ Symantec JITC, the MRJClasses folder and the lib folder
- MRJ Enabler extension (installed only on computers using Mac OS 8.1 or earlier)
- Text Encoding Converter 1.4.2
- Appearance Extension 1.0.3 (installed only on computers using Mac OS 7.6.1)

In the System Folder:

- A Text Encodings folder containing version 1.4.2 of the encodings

In the Control Panels folder (inside the System Folder):

- Appearance control panel 1.0.3 (installed only on computers using Mac OS 7.6.1)

In the Preferences folder (inside the System Folder):

- Appearance Preferences 1.0.3 (installed only on computers using Mac OS 7.6.1)

In the Apple Extras folder

- Mac OS Runtime for Java folder

For International Users

The MRJ 2.1 Installer installs U.S. English versions of the Text Encoding Converter 1.4.2 and associated text encodings. On most computers, these files replace older versions of the same files. However, on some computers sold outside the United States (such as computers sold in France), the filenames of the existing Text Encoding Converter and associated text encodings have been changed. On these computers, the MRJ Installer cannot recognize and replace the older files and does not install the Text Encoding software.

If you have a non-U.S. computer with Text Encoding 1.3 or later installed, MRJ works but may experience some text handling errors that don't occur on other computers.

If you have an earlier version of the Text Encoding software installed, an alert message appears during installation and tells you that your system software must be updated before MRJ can be installed.

Known Issues

- **Secure Sockets:** MRJ 2.1 does not support the Secure Sockets Layer interface (SSL), which allows applets to access Web pages via "https."
- **Appearance Manager 1.0:** If your system is using Appearance Manager 1.0 (which comes with Mac OS 8), you may see dialog boxes without borders or other visual inconsistencies. You should upgrade to Mac OS 8.1 or later. A free upgrade from 8.0 to 8.1 is available at Apple Software Updates Web site at http://www.apple.com/swupdates.
- **Games and modifier keys:** Some game applets use the Shift, Alt, and Control keys as game controllers. In some cases, these controls will not work as expected.
- **Apple Studio Display:** If you have an Apple Studio Display (flat-panel monitor) and Mac OS 8.1 or earlier installed, you may see cosmetic inconsistencies in the Monitors & Sound control panel. You should update your Apple Displays software, available from the Apple Software Updates Web site at http://www.apple.com/swupdates.
- **Yahoo games:** Multi-user Yahoo games do not work correctly using Internet Explorer and MRJ 2.1. Apple, Microsoft, and Yahoo are working together to resolve this problem.
- **Low memory:** When Java applications are running out of memory, MRJ may put up a blank window with no information in it and appear to crash. If this occurs, you can sometimes quit by selecting "Quit" from the Apple Menu (there is no Edit menu since Java did not start up properly). If several applications are running at the same time, quit unused applications to free up memory, or increase the amount of virtual memory in the Memory control panel, and then try the application again. If this problem persists, you may need to add additional physical RAM.
- **Printing:** If you use your browser's Print command to print a Web page that contains an applet, the page will contain a blank area where the applet should be. If available, use the applet's Print menu to print the page.

Miscellaneous notes

- **Java developers:** MRJ is a runtime environment and does not include development tools. If you are interested in Java development, you need a Java development environment and the MRJ Software Development Kit (MRJ SDK). For more information, see the MRJ developer page at **http://developer.apple.com/java/**.
- **Apple Applet Runner:** The Apple Applet Runner is now only available on the MRJ SDK. Apple Applet Runner 2.0, (which came with MRJ 2.0) is compatible with MRJ 2.1. For the latest version of Apple Applet Runner, download the MRJ SDK from the MRJ developer Web site at **http://developer.apple.com/java/**.
- **Swing:** MRJ 2.1 is compatible with both Swing 1.0.3 and SwingÂ 1.1. For more information or a copy of the Swing software, see the Sun Microsystems Web site at **http://java.sun.com/**. To run Swing-based applets and applications, place the "swingall.jar" file in the MRJClasses folder, in the MRJ Libraries folder in the Extensions folder (inside the System Folder).

Warning: Java technology is not fault tolerant and is not designed, manufactured, or intended for use or resale for online control of equipment in nuclear facilities, aircraft navigation or communication systems, or air traffic control computers in which the failure of the Java technology or Mac OS Runtime for Java could lead directly to death, personal injury, or severe physical or environmental damage.

MacDNS: Configuration & Setup

This article provides a walk-through for setting up and configuring MacDNS. It is adapted from the MacDNS Administrator's Guide.
This article has been archived and is no longer updated by Apple.

Creating a zone file

The part of the Internet domain name space, for which your MacDNS server contains information, is called its zone of authority. You need to provide your MacDNS software with details about your particular zone.

To create a zone file with the information about your zone:

1. Choose New Zone File from the File menu. A Zone Information dialog box appears, with an untitled host list window for the zone file underneath it.

Important: When you first see the Zone Information dialog box, its text boxes contain "templates" of the information you need to enter. You can follow the style of the template when you provide the information for your own zone. In the instructions that follow, verify the template information is selected for a particular text box, then type your own zone's information (the template text should be completely deleted or replaced).

2. In the Zone Information dialog box, type the domain name of your zone in the Domain Name box.

The domain name should be the name you've registered, as explained earlier in the section "Registering Your Domain."

3. Type the DNS name of your server computer in the Primary Server box.

Note: Verify you type a DNS name, which is different from the name you might have chosen for your computer, for Macintosh file sharing.

4. Type the name of a secondary server, for the zone, in the Secondary Server box.

A secondary server keeps a copy of your zone's information; a secondary server is useful for spreading the name-service load across multiple machines, and for ensuring that a zone has name service even if the primary server fails.

Note: MacDNS does not function as a secondary server: it only functions as the primary name server.

5. Type your email address in the Administrator box.

Your address will be useful to other administrators, who may need to contact you for help debugging problems that arise.

6. Type an amount in the Refresh Interval box, and choose a unit of time from the adjacent pop-up menu (or confirm the default value).

The Refresh Interval indicates how often a secondary server will query your MacDNS name server to see whether new information is available. If something has changed, the secondary server updates its information, updating is called a zone transfer.

- The recommended Refresh Interval is 8 hours.

7. Type an amount in the Retry Interval box, and choose a unit of time from the adjacent pop-up menu (or confirm the default value).

The Retry Interval represents the interval a secondary server will wait before reattempting to contact the MacDNS server, if the first attempt has failed.

- The recommended Retry Interval is 2 hours.

8. Type an amount in the Expire Interval box, and choose a unit of time from the adjacent pop-up menu (or confirm the default value).

The Expire Interval is the interval a secondary server will cache zone information it has already received, if the MacDNS server can't be reached to provide a zone transfer. The Expire Interval will set a time at which the zone data can no longer be regarded as up to date; after that point, the data is not considered useful, and it's better for the secondary server to provide no data than obsolete data. Once the Expire Interval limit is reached, the secondary server removes all data about your MacDNS server from its database.

- The recommended Expire Interval is 7 days.

9. Type an amount in the Minimum TTL box, and choose a unit of time in the adjacent pop-up box (or confirm the default value).

TTL represents time to live. The Minimum TTL is the minimum time to live for an entry in the MacDNS database.

- The recommended Minimum TTL is 1 day.

The following figure shows an example of a completed Zone Information dialog box:

Figure 1: Zone Information dialog box

Note: The values for the Refresh, Expire, and Minimum Intervals shows that the figure is the recommended settings for keeping your zone up to date without excessive network traffic.

10. Click OK.

After you click OK, the title of the host lists window changes to the name you entered, as the domain name, in the Zone Information dialog box. The name is preceded by a diamond until you save the zone file.

Important: To ensure you have a permanent record of the host information for your zone, be sure to save the zone file (choose Save from the File menu).

Configuring your parent server
The MacDNS server relies on other DNS servers, called parent servers, for answers to queries that it doesn't have in its own database. Generally, the MacDNS server should use the DNS server for your Internet service provider as its parent. You may also enter other servers to be alternate parents, which will be used if the first parent server isn't available.

MacDNS uses the DNS information that is configured in the MacTCP or TCP control panel to obtain a default list of parent servers. If that information has not been configured or is incorrect, you will have to configure the parent server(s) yourself.

To verify that your parent server information is correct, or to add alternate parent servers:

1. Choose Set Parent Servers from the Hosts menu.

A dialog box similar to the following one appears.

Figure 2: Parent Servers

2. Verify the default parent server information is correct; if it isn't, select the server name or the server IP address, and type the correct information.

3. If you want to add alternate parent servers, type the applicable information in the Server Name and the Server IP Address boxes.

4. Click OK.

Note: When you click OK, the new parent server information takes effect immediately; you don't need to restart the MacDNS application.

Adding hosts
To add information about a host computer:

1. Choose Add Permanent Host from the Hosts menu. The Host Information dialog box appears. The following figure shows a Host Information dialog box; note that most of the information has been entered according to the subsequent task steps in this section.

Figure 3: Host Information

2. Type the name of the host in the Host Name box. When the Host Information dialog box first appears, a "template" name appears in the Host Name text box. The host name is the canonical or "real" name of the host. You assign this name permanently to the host. The host name must include the domain name; since the domain name is automatically included as part of the template, all you need to do is select "a-permanent-host" and type the first part of your host's name.

3. Type the IP address assigned to the host in the IP Address box.

4. Type an amount in the "Time to Live" box and choose a unit of time in the adjacent pop-up menu; or, confirm the default setting. The Time to Live indicates time that a remote DNS server can cache information about this host. The default is the minimum time-to-live value for the zone, which is usually a good choice.

5. (Optional) Type the name of aliases for this host in the Aliases text box. The names you type must be separated by commas. Each name must be a fully qualified domain name.

Note: You cannot use an alias name that does not include the domain name of the host. For example, you can use "www.company.com" for an alias of "sage.company.com", but you cannot use "www.provider.com", because "provider.com" is outside the "company.com" zone. To work around this restriction, you can create a new zone file for the "provider.com" domain and add "www.provider.com" as a permanent host. You can then assign the IP address of the "real" host machine (sage.company.com) to this host.

6. (Optional) Type mail exchanger information in the Mail Exchangers text box; each entry you type must consist of a numeric preference value, followed by a space, then the name of the host that will either process or forward mail for the host that you are adding.

The mail exchangers are alternate hosts which mail may be sent to for ultimate delivery to this host (see the appendix for more details about mail exchangers).

The preference value indicates the mail exchanger's priority; the lower the number, the greater the preference. The value itself is not important, as long as the number for the mail exchanger that you want to be used first is lower than the values for any other mail exchangers you have entered. Multiple entries must be separated by a comma.

The following example indicates the correct format for an entry that includes two mail exchangers:

10 email.webewidgets.com, 20 Ur-mail.webewidgets.com

7. (Optional) Select the computer type for the host you're adding in the Hardware pop-up menu.

If you leave "None" selected, no computer type will be returned for host information queries from other DNS servers.

8. (Optional) Select the operating system for the host you're adding in the Software pop-up menu.

If you leave "None" selected, no operating system type will be returned for host information queries from other DNS servers.

9. Click OK.

Adding hosts that require a mail exchanger only
The MacDNS program allows you to choose hosts that need mail exchange service only and no other Internet services. If a host needs special handling of its mail delivery only, you don't need to assign an IP address, but you can assign a mail exchanger. Such hosts are called MX-only hosts.

An MX-only host is most commonly used when your domain name itself is not an actual host computer. You can use the domain name as the MX-only host name, then use the name of your local email host (and possibly your Internet service provider's email host, if you have made arrangements to do so) as the mail exchanger.

To assign a mail exchanger for an MX-only host:

1. From the Hosts menu, choose Add MX-Only Host.

The MX-Only Host Information dialog box appears.

2. Type the name of the host in the Host Name text box.

3. Type an entry in the "Time to Live" box and select a value from the adjacent pop-up menu; or confirm the default value.

The default time-to-live value is the minimum TTL for the zone, usually a good choice.

4. Type the numeric preferences and the names of hosts to act as mail exchangers in the "Mail Exchangers" text box.

Figure 4: MX-Only Host Information

Multiple entries should be separated by a comma. The lower the number you assign as a preference value, the greater the preference is for a host to act as a mail exchanger.

5. Click OK.

Mac OS X Server: Multiple UFS Partitions On The Same Physical Drive Not Supported

I want to have multiple UFS partitions on my hard drive, but I can't seem to do it. Is this possible?
This article has been archived and is no longer updated by Apple.
Now it is not supported or possible to create multiple UFS volumes on the same physical hard disk. However, it is possible to add multiple physical hard disks and format them in UFS.

To format a disk UFS, you may use a third party utility like Hard Disk Tools (HDT), by FWB, or a utility like pdisk or disk.

'Pdisk' and 'disk' are in Mac OS X Server.
/sbin/disk
/usr/sbin/pdisk

Pdisk and disk are two separate utilities. Pdisk can only edit the partition map of the drive, and does not format or initialize. Disk is used to initialize or format the drive/partition. It can also partition the drive but only into two partitions. You specify the size of the first partition and the second one is the rest of the drive.

The man page has further information on pdisk and disk. Pdisk is complex and the man pages should be consulted before using pdisk on any hard disk.

Also, if the hard drive already has a format (HFS/HFS+, Dos), it should automatically mount, and customers can use the 'initialize...' option under theTools menu in WorkSpaceManager.

Note: Any of these processes will erase the disk, removing all data.

Energy Saver: Sleep and idle contrasted (Mac OS 9 and earlier)

I have set the Energy Saver control panel to never spin down the hard disk, but when I select sleep from the special menu, the hard disk still spins down. Why?

This document applies to Mac OS 9 and earlier.
This article has been archived and is no longer updated by Apple.
The slider controls, in the Energy Saver control panel, affect only what happens when the computer is left unattended, also known as an idle state.

Note: The button highlighted in the Energy Saver Control panel says "Idle Sleep."

This panel only controls what happens when the computer is left untouched for the time you specify in this panel. However, if you choose sleep from the Special menu, or from the dialog presented when you press the power key, you are manually ordering the computer to go to sleep, so these settings would be ignored.

The Energy Saver control panel is actually an application, which serves as a front-end to the Power Manager, which controls the power management hardware. Disabling Energy Saver will change the state of any of the user-definable settings, as these settings reside in the Energy Saver Preferences file.

When Energy Saver calls the Power Manager with the settings, the Power Manager writes 2 values to PRAM, the sleep timeout and hard drive sleep time as numbers from 0-255. Each number is an increment of 15 seconds so to sleep in 30 minutes, 120 is stored in PRAM. These are the only settings saved to PRAM.

Note: These are just the length of time, and not whether the system or hard disk sleep has been disabled (set too never).

Disabling Energy Saver will cause the system to sleep in about 1 hour, if the system were set to never sleep. This is true if booting with extensions off, or just removing the Energy Saver control panel. If the system were set to sleep at some specified time that will still be honored.

Also, the monitor will not dim, if the system is booted with extensions off or the Energy Saver control panel disabled. The monitor will be turned off when the system sleeps.

There are no user-definable settings for the sleep state, only for what happens when the computer is idling or waking. Putting the computer to sleep manually will always lead to the same behavior:

On all computers:
- the processor will go into a low-power mode
- video output will turn off, as a result the display may turn off as well
- the Apple-supplied hard disk will spin down

On PowerBooks:
- the Ethernet ports(s) will turn off *
- the PCMCIA port(s) will turn off *
- the Serial port(s) will turn off *
- the built-in modem will turn off *
- the ADB or USB connection will only respond to the power key on an external keyboard
- the CD or DVD drive will spin down
- Audio input and output will turn off

On some desktop and mini-tower computers:
- Audio input and output will turn off
- The CD or DVD drive will spin down

*** Note:** Network connectivity will be lost during the sleep state on a PowerBook. If you wish to use file sharing or remain connected to a dial-up internet connection, consider setting the Energy Saver control panel to sleep = never, setting separate timing to spin down the hard disk, and dim the display when not in use.

To wake a PowerBook, which is in sleep mode, from an externally connected keyboard, you must press the power key on the external keyboard or any key on the built-in keyboard. Other keys on the external keyboard will not wake the PowerBook from sleep in this power-saving state. If the PowerBook is not completely asleep, but has simply spun down the hard drive and dimmed the display on idle, pressing any key on either keyboard will "wake" the computer.

On computers running Apple Video Player or Apple DVD Player as the front most application, the computer will not go to sleep when left idle. Other applications, such as some fax software, will also prevent the computer from going to sleep when the Idle Sleep timeout value is reached.

Apple Software Install and Apple Software Restore differences

Confused about the different types of installation options available with "Apple Software Install" compared to "Apple Software Restore"?
This article has been archived and is no longer updated by Apple.

Apple Software Install

Custom Installation

Use this option to add or remove individual Apple software components.
See "Miscellaneous Manuals". Select the Troubleshooting Handbook - Reinstalling Your Computer's Software.

Clean Installation

A clean installation disables the existing System Folder, leaving all files in place, and directs the installer to create a new System Folder. The old System Folder will be renamed "Previous System Folder," and from there you can drag any fonts, preferences, or other necessary files to the new System Folder. It is recommended that you drag as few items as possible because some items in the previous System Folder may be the source of the difficulty.

See the following documents for additional information:

- "Mac OS: When and Why to Perform a Clean Install"
- "Miscellaneous Manuals". Select the Troubleshooting Handbook - Performing a Clean Installation.
- "Mac OS 8.5, Mac OS 9: Performing a Clean Installation"

Install

An installation with no options selected checks the current system files and replaces only the system files that are an older version than those on the disk image.

Apple Software Restore

There are two versions of Apple Software Restore. The first version is for computers that came only with Mac OS 9.1 and earlier. The second version is for computer that came with both Mac OS 9.1 and Mac OS X. If your computer came with both Mac OS 9.1 and Mac OS X installed on the hard disk, you should follow the restore procedure outlined in "Apple Software Restore: How to Perform a Multiple Disc Restoration" because the features listed here are not included with the multiple disc restoration.

Restore in Place

A restore in place replaces all the software that came installed on the computer without version checking. Extensions conflicts caused by third-party software may persist, because third-party software is unaffected by this type of install. See "Apple Software Restore: Some Preferences May Be Lost"

Important: Performing this action removes most updated system software components installed after the initial use of the system and replace them with what was originally installed upon first use. It is necessary to reinstall updates after the "Restore in Place" procedure has completed. It is not necessary, however, to reinstall firmware updates after this action is performed. On computers running Mac OS 9 or later, using the Software Update feature should ease any confusion about which updates are necessary and should automate the process of installing the updates. For more information about using the Software Update feature, see "Mac OS 9: How To Use The Software Update Control Panel".

Erase and Restore

An erase and restore erases the entire contents of the hard disk and restore it with the original disk image. See "iMac: System Software Reinstall Options".

Restore

A restore with no options selected places the contents of the Macintosh HD into a folder named Original Items. The hard disk is restored with the disk image. See "iMac: System Software Reinstall Options".

iMac CD Update 2.0: Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding iMac CD Update 2.0, with answers to those questions.
This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. Which computers work with the iMac CD Update 2.0?
2. What improvements does the iMac CD Update 2.0 include?
3. Should the iMac CD Update 2.0 be installed on all iMac computers?
4. Does iMac CD Update 2.0 replace the iMac CD Update 1.0?
5. iMac CD Update 2.0 reports the "Update is NOT necessary", and the "Device has already been updated."
6. Does iMac CD Update 2.0 make any changes to the iMac if the updater reports that the "Update is NOT necessary"?
7. When I ran iMac CD Update 2.0 on my iMac, I got an error message that the update failed due to a "Program or drive configuration Error." What does this mean?

Question 1: Which computers work with the iMac CD Update 2.0?

Answer: iMac CD Update 2.0 will work on most 233 MHz, 266 MHz, and 333 MHz iMac computers.

Question 2: What improvements does the iMac CD Update 2.0 include?

Answer: iMac CD Update 2.0 places a new version of firmware on the CD-ROM drive to reduce disc vibration caused by unbalanced CDs. The update also corrects a ten-second pause that can occur intermittently on some iMac computers.

Question 3: Should the iMac CD Update 2.0 be installed on all iMac computers?

Answer: If your iMac has vibration noise when using certain unbalanced discs, or if your iMac intermittently pauses for ten seconds during normal use, then the update should be installed. If your iMac is not experiencing either of these issues, it is not necessary to install the update.

Question 4: Does iMac CD Update 2.0 replace the iMac CD Update 1.0?

Answer: Yes, iMac CD Update 2.0 replaces iMac CD Update 1.0. This update incorporates the firmware that was part of the iMac CD Update 1.0. If you have already used 1.0 to update your CD drive, then updating to 2.0 is unnecessary.

Question 5: iMac CD Update 2.0 reports the "Update is NOT necessary", and the "Device has already been updated."

Answer: There are two reasons why this message occurs.

- A previous version of the update, iMac CD Update 1.0, has already been installed on the iMac, and that is all that is required for your CD-ROM drive.
- The appropriate firmware update has already been installed during manufacturing.

In either case, the iMac CD Update 2.0 is not needed because the drive has already been updated with the latest firmware.

Question 6: Does iMac CD Update 2.0 make any changes to the iMac if the updater reports that the "Update is NOT necessary"?

Answer: If iMac CD Update 2.0 determines the latest firmware is already installed on the CD-ROM drive, a dialog box appears indicating that the update is unnecessary. Clicking OK will quit the updater, leaving the iMac and CD-ROM drive untouched.

Question 7: When I ran iMac CD Update 2.0 on my iMac, I got an error message that the update failed due to a "Program or drive configuration Error." What does this mean?

Answer: A "Program or drive configuration Error" indicates that you are attempting to update a CD-ROM drive that does not work with iMac CD Update 2.0.

AppleShare Client 3.8.3: Requires Mac OS 7.6 or Later

Some AppleShare Client 3.8.3 Read Mes says Mac OS 8.1 or later is a system requirement. Is this correct?
This article has been archived and is no longer updated by Apple.
There are a couple of AppleShare Client 3.8.3 Read Me files that are incorrect; they claim the system requirement is Mac OS 8.1 or higher. These Read Mes are accessed from the Apple Software Updates, from the "ZM-AppleShare Client 3.8.3.smi" file, or when installed by the AppleShare IP 6.1 or 6.2 CD.

The correct system requirement is Mac OS 7.6 or higher, and this information is published in the following locations:

- Knowledge Base article 58360: **AppleShare Client 3.8.3: Read Me**
- The Read Me for AppleShare Client 3.8.3. This software was released by Apple on May 10, 1999 and is available for downloading from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Mac OS X Server: How to Reset NetBoot Client Entries in NetInfo

Sometimes a NetBoot client may fail to start up from the NetBoot server even though the Network Disk is selected in the Startup Disk control panel, and the N key is pressed at system startup time. This may happen because the client information stored in NetInfo is unusable. This article explains how to delete the client information from NetInfo.
This article has been archived and is no longer updated by Apple.
It is possible that the information in the NetInfo database about a NetBoot client becomes unusable. If this happens, deleting the client's entry in NetInfo allows the default information to be restored when the client starts up again. Deleting these NetInfo entries does not result in loss of user data, and the entries are automatically restored when the client starts up again.

Please read article 60038: "**What is NetInfo?**" for instructions on backing up the NetInfo database before continuing.

To delete the NetBoot entries, log in as root or as a member of the wheel group.

1. Open NetInfoManager by choosing Server Administration from the Apple Menu, then choosing NetInfoManager from the submenu (`/System/Administration/NetInfoManager`).
2. In the Directory Browser, select the /machines directory.
3. Highlight the name of the NetBoot client that is not starting up from the NetBoot server.
4. Choose Delete from the Edit menu, or click the Trash button in the NetInfoManager window.
5. Save changes. **Note:** After saving changes, the MacNC id for the client that is not starting up from the NetBoot server is unused. This MacNC id will be reassigned to the next NetBoot client that has not already started up from the NetBoot server.
6. After you have confirmed the changes in Netinfo, restart the client in question.

Internet Setup Assistant: Reusing Configuration Names

This article tells how to use the Internet Setup Assistant to create a configuration that uses the same name as a previous configuration.
This article has been archived and is no longer updated by Apple.
You must delete the configuration from the Modem, Remote Access, and TCP/IP control panels and delete the set from the Internet control panel. Additionally, you must remove the Internet Preferences file from the Preferences folder, in the System Folder. **Warning:** This removes all the preferences for the Internet control panel.

If your desired configuration is the only one in the Internet control panel, this is not really an issue, since it needs to be deleted anyway. This additional step allows you to reuse your desired configuration name. Another choice is to run a restore in place, which overwrites all the required preferences, but other preferences are lost too, so caution should be applied.

Additionally, without removing the Internet Preferences file, consider duplicating an existing Internet control panel set, modify it with your desired preferences, rename it, and use that name instead.

WorldScript: 1-byte and 2-byte Script Systems Explained

This article defines the following terms:

- ASCII character set
- Script system
- 1-byte simple script system
- 1-byte complex script system
- 2-byte script system
- WorldScript I
- WorldScript I

This article has been archived and is no longer updated by Apple.

ASCII character set

ASCII is an acronym for American Standard Code for Information Interchange. The 7-bit ASCII character set contains 128 characters, including standard Roman upper and lower case letters, common punctuation marks, and control characters. 8-bit ASCII, sometimes called high ASCII or extended ASCII, contains an additional 128 values, which can be used by foreign writing systems for other characters that are not available in the standard 128 characters.

Script system

A script system is a collection of software facilities that provide for the representation of a specific writing system. It consists of a set of keyboard resources, a set of international resources, any fonts, and possibly a script system extension (1-byte or 2-byte). Script systems include Roman, Japanese, Arabic, Traditional Chinese, Simplified Chinese, Hebrew, Cyrillic, and Korean. Types of script systems include 1-byte simple, 1-byte complex, and 2-byte (also called 16-bit).

1-byte simple script system

A 1-byte simple script system supports a writing system with a small character set (requires only 1-byte characters), has a left-to-right text direction only, and that is non-contextual. The Roman script system is an example of a 1-byte simple script system.

1-byte complex script system

A 1-byte complex script system supports a writing system with a small character set (requires only 1-byte characters), but that is characterized by bidirectional or contextual text (characters whose appearance may be different, relative to their position to other characters). Arabic and Hebrew are examples of complex 1-byte script systems.

2-byte script system

A 2-byte script system supports a writing system with a large character set (requires 2-byte characters) and requires sophisticated procedures for character input. Japanese, Chinese, and Korean are examples of 2-byte script systems. 2-byte characters, such as Kanji, consist of two 8-bit (1-byte) characters which, placed beside each other, are displayed by the System as a single character.

WorldScript I

WorldScript I is an extension to the Mac OS that is used for all 1-byte complex script systems. Code in the extension reads tables in the script system's international resources to provide the proper text manipulation and formatting for that script. Simple 1-byte script systems do not need to use WorldScript I.

WorldScript II

WorldScript II is an extension to the Mac OS that is used for all 2-byte script systems. Code in the extension reads tables in the script system's international resources to provide the proper text manipulation and formatting for that script. WorldScript II functionality has been incorporated into Mac OS 9 and is no longer a separate extension.

Parts of this information were compiled from Apple's technical documentation, Inside Macintosh: Text.

AppleShare Mail Server: How To Prevent Unauthorized Mail Relaying

This document explains how to prevent unauthorized mail relaying on an AppleShare mail server.
This article has been archived and is no longer updated by Apple.
To disable SMTP relay for ASIP 6.2 to prevent unsolicited email (sometimes called "spam"), follow these directions.

1. Update to Mac OS 8.6 and ASIP 6.2 (ASIP 6.2 is required for some settings).

2. Open the Mail Admin application.

3. Choose Mail Server Settings from the Server menu.

    - Click the "Mail In" tab, and put a checkmark in the "Require Local "From" Addresses to exist in Users & Groups."

4. Choose Advanced Mail Server Settings from the Server menu.

    - Click the "Network" tab and select "Always Check DNS."
    - Click the "Anti-Spam" tab and put a checkmark in "Check Incoming SMTP Connections."
    - Put a mark in the radio button "Use default server for spam rejection" (Real-time Blackhole List). Note - all known spammers and relayers of spam will be prevented from connecting to your server.
    - Put a checkmark in "Log connection if SMTP name does not match IP address."
    - Put a checkmark in "Reject if name does not match address." **Note:** This will lock out relayers spoofing your email server DNS name, but it will also lock out email servers with misconfigured DNS settings (which happens very frequently).

5. Choose Show Host List from the Server menu.

    - Delete all hosts on external networks except those you have modified manually. Do not delete hosts on your local network.

6. Choose Edit Default Host Profile from the Server menu.

    - Click the "Mail From" tab and put a checkmark in "Deliver mail from this host to local addressed only (no SMTP relay)."
    - Optionally, put a checkmark in "Log recipient rejections to error log." This allows you to log anyone attempting to relay through you.
    - Click the "Mail To" tab, and remove the checkmark (if present) for "Relay all SMTP mail via ...."
    - Click the "Network", and select "Use Advanced Settings."

7. Edit postmaster settings.

    - Open the Web & File admin.
    - Choose Show Users & Groups List from the Users menu.
    - Edit the settings for the Mail Administrator (postmaster) user account by double-clicking the user in the list.
    - Select Mail Settings from the pop-up menu and choose "None."

AppleWorks: Font Smoothing Changes Font Spacing

The letter spacing and line breaks of an AppleWorks document are not the same on computers with Mac OS 8.1, and those with Mac OS 8.5 or later.

This article has been archived and is no longer updated by Apple.

One of the features introduced in Mac OS 8.5 is Font Smoothing, also called anti-aliased text. Font Smoothing softens the edges of text on the screen so the characters do not look jagged. The width of text on the screen may be different when smoothing is turned on, which may cause line breaks in your documents to change from how they were on a computer with Mac OS 8.1.

Follow these steps to make documents look the same on computers with both operating systems:

1. Turn off Font Smoothing:
   - Quit AppleWorks
   - Open the Appearance control panel.
   - Click the Fonts tab.
   - Deselect the Smooth all fonts on screen option.

2. Turn off Fractional Character Widths in AppleWorks Preferences.

3. Make sure the same printer is selected on each computer. Page dimensions are read from the printer driver, and this can contribute to differences in spacing. Choose Page Setup from the File menu to check this setting.

4. You may need to install identical fonts on all computers by copying some Mac OS 9 fonts to the computers with system software earlier than Mac OS 9. Although the font names may be the same, fonts with similar names may be from different vendors, or a font's metrics might have changed between Mac OS releases.

ColorSync: Match Link via AppleScript

I have written an AppleScript using the "match link" verb, but it did not work. Below is my sample AppleScript:

```
on open dropitems
set MatchLink_Prof to choose file
tell application "ColorSync Extension"
repeat with i in dropitems
match link i through link MatchLink_Prof
end repeat
end tell
end open
```

I saved the script as an AppleScript application. After dropping JPEG or TIFF files onto the script and selecting a profile, such as the Color SW 2500 Pattern or Color LW 12/600 PS Profile, the script returns the error "Invalid link profile." What am I doing wrong?
This article has been archived and is no longer updated by Apple.
The following test was performed, and the script functioned correctly.

The script was pasted into Script Editor v1.1.3, running on a Mac OS 8.6 system, and saved as an Application. Several JPEG files were dropped onto the script and a link profile was selected; the script matched all the images correctly.

In the original tests, the Color SW 2500 Pattern or Color LW 12/660 PS regular profiles not link profiles were chosen, generating the error "Invalid link profile."

The "match link" verb is used with link profiles, which are unusual profiles consisting of two or more profiles combined into one. Although they are not often used, Apple has included the "match link" verb.

"match link" - transforms using a 'link' profile.

Example:
A RGB-CMYK-RGB link profile would transform an image from one device's RGB color space, match it to another device's CMYK color space, then save it back to yet another RGB color space. Finding such a link profile, on a web site or an installation disk, is unlikely; they are usually custom made for a specific solution, such as for a customer's specific devices used in a specific order.

If a true link profile had been used and problems encountered, then check whether the image is in the same space as the first profile in the link profile. A RGB-CMYK-RGB profile can only be used on RGB images, as it is going from RGB to CMYK to RGB. If the image were not RGB to start with, you would get an error.

When working with standard device profiles, such as the profiles Apple ships, or profiles obtain with other products, or downloaded from the manufacturers' web sites, you will want to use the verb "match" or "proof" instead of "match link."

"match" - transforms from a source profile to a destination profile, such as from RGB to CMYK, or RGB to RGB.

"proof" - transforms from a source profile to a destination profile to a proof profile, such as from RGB to CMYK to RGB.

For examples on how to use the match and proof verbs, examine the sample scripts "Match to specific profiles" and "Proof to specific profiles." These sample scripts may be found in the AppleScript Files folder in the ColorSync Extras folder located in the Apple Extras folder.

QuickTime: How to troubleshoot the web browser plug-In

Learn the process for troubleshooting QuickTime browser plug-ins.
This article has been archived and is no longer updated by Apple.
You can use the QuickTime Sample Movie (in the QuickTime folder) to make sure the QuickTime Plug-in is installed and working. If you don't have the QuickTime Sample Movie on your hard drive, you can use the Sorenson Sample movie available here.

Microsoft Internet Explorer
To test the QuickTime plug-in:

1. Open a new browser window.
2. Locate the QuickTime Sample Movie in the QuickTime folder, and position the window so you can see both the file and the browser window.
3. Drag the QuickTime Sample Movie icon onto the browser window.

A new window should appear and the movie should play. If you see an alert box, or if the window has no graphics, or plays no sound, try these steps:

1. Recopy the plug-in into the browser's plug-ins folder
2. Reinstall the browser.
3. If you have Mac OS 9 or earlier, troubleshoot system extensions conflicts.

For extension troubleshooting help, see "Mac OS: Extensions Troubleshooting/Extensions Manager Features"

Netscape Navigator and Communicator
To test the QuickTime plug-in:

1. Open a new browser window.
2. Locate the QuickTime Sample Movie in the QuickTime folder, and position the window so you can see both the file and the browser window.
3. Drag the QuickTime Sample Movie icon onto the browser window.

The movie should play. If you see an alert box, or if the window has a picture of a broken plug-in icon, or plays no sound, try these steps:

1. Quit the browser.
2. Copy the QuickTime plug-in from the QuickTime folder into the Netscape Plug-ins folder.
3. Reopen the browser.
4. Drag the Sample Movie onto the window.
5. If you have Mac OS 9 or earlier, troubleshoot system extensions conflicts.

Mac OS 9: Microsoft Office 4.2.1 Compatibility Issues

There seem to be some compatibility issues with Microsoft Office 4.2.1 and Mac OS 9. Is there any way to resolve them?
This article has been archived and is no longer updated by Apple.
There are known issues when using Microsoft Office 4.2.1 with Mac OS 9. Some can be resolved by doing a clean installation of Mac OS 9 and then reinstalling Microsoft Office 4.2.1.

Note: The installer may become unresponsive if you try to switch applications while it is running.

If the above steps do not resolve the issues, there are only two solutions:

- Upgrade to Office 98.
- Reinstall the older version of Mac OS.

PowerBook G3: Turn Processor Cycling Off When Using USB Adapter Card

This article describes a situation that may cause computers with USB Adapter Cards to stop responding and provides a workaround.
This article has been archived and is no longer updated by Apple.

Symptom

After installing the USB Adapter Card Support software from Apple, the PowerBook occasionally stops responding when a USB CardBus (PCMCIA style) card is installed.

Solution

PowerBook G3 computers, with CardBus cards, stop responding with USB Adapter Card Support installed if processor cycling is enabled. Use the Energy Saver control panel to turn off processor cycling for both battery and power adapter operation.

Mac OS X Server: Excess Memory Usage by Terminal.app

Terminal.app seems to use a lot of memory; significant amounts of RAM are released when closing some terminal windows.
This article has been archived and is no longer updated by Apple.
The default setting for Terminal.app is to keep an infinite history for the window. All the data is stored in RAM, so closing the window will release the history and the RAM it uses.

Terminal.app has a preference to control the number of lines saved in the history buffer. This setting can be used to control Terminal.app's RAM usage.

Macintosh: Restarting After Power Failure or System "Crash"

This article discusses ways to restart a Macintosh after a power failure or system "crash" and using an uninterruptible power supply (UPS).
This article has been archived and is no longer updated by Apple.
Depending on your hardware, there are different ways to restart your Macintosh after a power failure or system "crash". (The term "crash" does not imply damage to your computer.)

Power failure restart

Some early Macintosh computers have a slotted power button on the back of the computer. If your computer has this type of power button, you can press it in and turn it to a horizontal position (with the computer upright) to lock it in the on position. The computer will turn on when power is restored.

The Energy Saver and Auto Power On/Off control panels, on later Macintosh computers provide software solutions for power failures. See article 18127 "**Energy Saving Control Panels: Description & Compatibility**" for a matrix on which computers can use what versions of the Energy Saver or Auto Power On/Off software.

Notes

1. By default, the Energy Saver will not restart after a power failure.

2. When AppleShare IP is installed, the Energy Saver control panel settings are changed and all server settings are enabled. Choose Server Settings from the Preferences menu in the Energy Saver control panel to see the server settings. (See Figure 1.)

Figure 1 Energy Saver Server Settings window

If you use the Auto Power On/Off Control Panel (see Figure 2), the options are not enabled and you have to open the control panel and click the appropriate checkbox.

Figure 2 Auto Power On/Off window

System crash restart

There are third-party solutions that can monitor your computer and restart it after a system crash. These solutions usually consist of power supplies, software and either an ADB or USB dongle. When the software loses communication with the hardware dongle, a system crash or freeze is assumed and a monitoring software sends a command to restart the computer.

Note: Using the AppleShare IP settings is recommended for restarting the server.

These companies provide monitoring software and hardware solutions:

- APC (http://www.apcc.com)
- Sophisticated Circuits (http://www.sophisticated.com)

Uninterruptible Power Supply (UPS)

To provide power during a power failure, you can use an uninterruptible power supply (UPS). A UPS provides battery backup power during power failures by using a backup battery system.
Note: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement.

AppleShare IP: Hiding PostScript Printers

Is there a list of printers that AppleShare IP may hide? AppleShare IP's Help implies you may hide nearly any printer; however, my understanding is the hide feature requires an Apple brand printer because this is an Apple ROM- (printer) based feature.
This article has been archived and is no longer updated by Apple.
Apple does not maintain a list of third-party AppleTalk printers that may be hidden with AppleShare IP. The process, using an industry-standard PostScript command, is the same as when capturing an Apple LaserWriter.

AppleShare IP uses a PostScript operator to change printers' AppleTalk Type; thereafter, the printer will not respond to NBP Lookups from and won't be visible to client Macintosh computers. The print server will know what printer's current AppleTalk Type, having changed it, and will be able to locate, open up a connection, and print to it.

If a printer or RIP, possibly used in combination with an optional network interface, doesn't support fully PostScript and the "appletalktype" PostScript operator, then the hide feature may not work. If you encounter such a device, you may wish to check with the manufacturer of that device to verify compatibility with this operator.

Location Manager: Time Zone Module Conflicts With Date & Time DST

My Macintosh clock is wrong by one hour, and the Location Manager seems to be causing this when I change location settings. Why is this happening?
This article has been archived and is no longer updated by Apple.
When Set Daylight-Saving Time Automatically is checked in the Date & Time control panel, the time is actually adjusted forward or backward by changing the Greenwich Mean Time (GMT) offset by 1.

When a location is created using the Time Zone setting, the Location Manager remembers the GMT offset for the new location.

The Location Manager is not Daylight Saving Time-savvy and is unaware when the saved GMT offset for a location has been affected by a Date & Time control panel time shift. The Location Manager will change back to the GMT offset known before a Daylight Saving Time change occurred, thereby throwing the clock off by an hour.

After a Daylight Saving Time change, the Location Manager will also believe that the location needs updating, because it notices the different GMT offset.

Workaround
When a Daylight Saving Time switch occurs, you must edit each location with a Time Zone setting and apply a new GMT offset for each location.

iMovie: Cannot Export to Tape Error

This article has been archived and is no longer updated by Apple.

When exporting to tape, the following message may appear

> "Not possible to record to your camera. Please check your camera to make sure the tape is in and the tape record tab is in the closed position."

This article explains why this might happen and offers a solution.

This occurs most often when using a Digital 8 Camera, which uses a Hi-8 tape for playback and recording. There are two different types of Hi-8 Tapes—Metal Particle and Metal Evaporative. iMovie can only export to Metal Particle tapes. Using Metal Evaporative tapes can result in this error message being generated.

If you receive this error, you should try to use a Metal Particle tape to export your digital video. There is a mechanical relationship between the camera and the tape that triggers these kinds of states; iMovie has to believe what the camera reports back to the application.

If everything else is working except the export, the most likely explanation is that the write-protect tab on the tape doesn't properly register with the camera. This results in the camera reporting the tape is write-protected or not present. It is sometimes possible to record to one of these tapes by putting a piece of cellophane tape over the write-protect tab, but the results of this process are not consistent. The recommended solution is to use the highest quality tape to export your video.

Mac OS 9: Reregistering QuickTime Pro After Installation

This article explains why, after installing Mac OS 9, you may get a QuickTime message asking whether you want to upgrade to QuickTime Pro even after registering QuickTime.
This article has been archived and is no longer updated by Apple.
After installing Mac OS 9, you may need to be identified as a QuickTime Pro user again. To establish your QuickTime Pro registration again, you can:

- Re-enter the name and registration number into the QuickTime Settings control panel.
- Get the key resent to you, if you registered over the World Wide Web. For additional information, see Knowledge Base article 58453: "**QuickTime Pro: How to Get Key Resent if Lost**."
- Recover the old QuickTime Pro settings, if a clean installation was performed, by copying the QuickTime Preferences file from the Previous System Folder to the new System Folder using the following steps:

    1. Open the Preferences folder of your current System Folder and move the QuickTime Preferences file to the Trash.
    2. Open the Preferences folder of your previous System Folder and drop the QuickTime Preferences file onto the new System Folder. It will be automatically moved to the Preferences folder.
    3. Restart the computer and empty the Trash.

Speakable Items: Using With IBM ViaVoice

This article describes the use of IBM's ViaVoice product while Speakable Items is active.
This article has been archived and is no longer updated by Apple.
Some users may wish to do both command and control using Speakable Items as well as dictation using ViaVoice. The one technical limitation is the Sound Manager, which permits only a single client to own the sound input source at any time. Therefore, it is required that the microphone be released and obtained by all speech systems in an orderly manner. Since there is no microphone arbitration policy provided by the Sound Manager, difficulties can arise when you attempt to run both Speakable Items and ViaVoice. To use both facilities simultaneously requires that you do all the microphone arbitration.

Use one of the following alternatives to start both facilities together.

Perform these steps first:

1. Open the Speech control panel and select Listening from the Options pop-up menu.
2. Select the "Key(s) toggle listening on and off" radio button. (This enables the keyword mode, instead of push to talk).
3. Select Speakable Items from the Options pop-up menu, in preparation for starting Speakable Items.

Alternative 1 - Starting Speakable Items first

1. Start Speakable Items from the Speech control panel. When Speakable Items is active, toggle listening off (by pressing the esc key).
2. Start SpeakPad and dictate.
3. To use Speakable Items, turn the microphone off in SpeakPad. Toggle listening on (by pressing the esc key) for Speakable Items.

Alternative 2 - Starting SpeakPad first

1. Start SpeakPad and dictate.
2. To use Speakable Items, turn the microphone off in SpeakPad.
3. Start Speakable Items from the Speech control panel.

Once both facilities are active, the essence of the manual arbitration is that when switching to SpeakPad, you must toggle listening off (by pressing the esc key) for Speakable Items, before turning SpeakPad's microphone on. Conversely, when you want to use Speakable Items, turn SpeakPad's microphone off before toggling listening on (by pressing the esc key) for Speakable Items.

The following situations will occur using the current release of Speakable items (for Mac OS 9) and ViaVoice:

- If Speakable Items is running and in keyword mode (not push to talk) then toggling listening off will release the microphone so that SpeakPad can obtain it. This is generally controlled by the esc key unless you have remapped it. If push to talk mode is used, Speakable Items will have to be turned off to release the microphone.
- If Speakable Items, or the Speech Listener or any PlainTalk client is running, SpeakPad will open and then quit, since it will not be able to obtain the microphone.
- If SpeakPad is running and enabled for dictation and you open Speakable Items, then Speakable Items will quit because it cannot obtain the microphone.
- If both applications are running, switching into SpeakPad while Speakable Items has the microphone will result in a notification that dictation is disabled because SpeakPad cannot get the microphone.

Remote Access: How To Use DialAssist Settings

This article tells where to find the DialAssist settings for using a calling card.
This article has been archived and is no longer updated by Apple.
If the option for "Use DialAssist" is missing from the main Remote Access control panel follow these steps:

1. Choose User mode from the Edit menu.
2. Select Advanced and click OK.

The option "Use DialAssist" will now be placed next to "Save Password."

Enable Use DialAssist to have Remote Access use the DialAssist settings.

Power Mac G4 (AGP Graphics): DVD-RAM Drive Differences

This article helps you identify the DVD-RAM drive in your Power Mac G4 (AGP Graphics) computer.
This article has been archived and is no longer updated by Apple.
Two different kinds of DVD-RAM drives were used in the Power Mac G4 (AGP) computers. They have the same specifications and are functionally similar, but were made by different manufacturers. Because these drives were provided by different vendors, there are some differences. The main differences between these two drives are the tray (the slot you put a disc into) and their ability to accept discs of nonstandard size and shape.

One of the DVD-RAM drives uses a slotted tray, shown in Figure 1 below. This drive accepts only discs of a standard size and shape.

Figure 1: Slotted tray

The other DVD-RAM drive (shown in Figure 2 below) uses a flat carrier tray. In addition to standard discs, it can accept discs of a nonstandard size and shape.

Figure 2: Flat carrier tray

For more information on the size and shape of discs that can be used in your DVD-RAM drive, please see article 58641: "**Macintosh: Using Nonstandard Discs in Optical Media Drives**"

Final Cut Pro 2: Installing International Version On Localized Mac OS

When installing the International English version of Final Cut Pro 2.0 onto a Macintosh that has a localized version of Mac OS, you may have extension conflicts. This article provides steps to avoid this situation.
This article has been archived and is no longer updated by Apple.
When the Mac OS is localized into a foreign language, the file names of most system components are translated into that language.

Although the International English Installer for Final Cut Pro 2.0 installs the latest English FireWire and ATI (video) drivers, it does not remove the earlier localized drivers. Having both the earlier and later extensions present in your System Folder can cause your computer to be unstable when using Final Cut Pro.

To install International version of Final Cut Pro on localized OS, do the following:

1. Install the localized version of QuickTime 5 that corresponds to your localized version of the Mac OS.
2. Remove QuickTime FireWire DV Enabler.
3. Remove QuickTime FireWire DV Support.
4. Remove the additional two FireWire extensions.
5. Remove All ATI extensions.
6. Install Final Cut Pro 2.0.

For more information regarding which version of QuickTime to use with Final Cut Pro, please see article 24991: "**Final Cut Pro: Compatibility Matrix**"

Published Date: Feb 20, 2012

QuickTime Streaming Server: Creating Users And Groups

This article explains how to create users and groups, and assign privileges for QuickTime Streaming Server 2.0 authentication on Mac OS X Server.
This article has been archived and is no longer updated by Apple.
Note: Authentication requires that clients use QuickTime Player 4.1 or later. Earlier versions of QuickTime Player cannot authenticate. These users receive a 401 error if you use authentication with QuickTime Streaming Server 2.0.

Example: Adding a new user

```
root# /usr/sbin/qtpasswd -c /etc/qtusers bassanio
Adding password for bassanio.
New password:
Re-type new password:
```

To add another user, do the same, but leave off "-c," which clears the user and group file for the first user. To add each new user and password onto /etc/qtusers follow the example below.

Example: Adding an additional user

```
root# /usr/sbin/qtpasswd /etc/qtusers portia
Adding password for portia.
New password:
Re-type new password:
```

You can repeat this as often as you like, creating different user and group files for QuickTime access. This allows you to have different sets of users and passwords for each directory that needs protecting. The generated /etc/qtusers file is similar to the one show below.

```
bassanio:6rLfAC7rSDv6g
portia:UwtyIfJ/Ivp4o
```

If you have many users, they can be organized into groups by creating a text file /etc/qtgroups. (See example of format below.)

```
<group1>:    [&#91;<username1> <username2> <username3> ...&#93;]
<group2>:    [&#91;<username1> <username2> <username3> ...&#93;]
```

Example: /etc/qtgroups text file

```
File:  /etc/qtgroups
====================
everyone:     bassanio portia
engineering:  bassanio
marketing:    portia
```

Notice that a space separates each username. This means usernames cannot contain a space. Passwords do not have this limit.

In the local movie directory that you want to protect, create a file named 'qtaccess' with the following information. (You can use this as a template.)

```
AuthName QuickTime Streaming Server
AuthUserFile /etc/qtusers
AuthGroupFile /etc/qtgroups
require user bassanio
require group engineering
```

In this example, to authenticate with QuickTime 4.1, the user will either have to provide the name "bassanio" and the right password, or any valid username and password for a member of the group "engineering".

Mac OS 9: Set-up and Management of The Multiple Users Control Panel

How to set up and manage the Mac OS 9 Multiple Users feature.
This article has been archived and is no longer updated by Apple.
Multiple users can use the same computer by creating a unique environment for each user. You, as the computer's owner, can create and control the following items.

- Which applications and hard disk locations each user can access.
- Create up to 40 different user accounts and one guest user account.
- Assign another user the privilege to create and manage user accounts.

To create and manage user accounts, open the Multiple Users control panel.

Note: Before using the Multiple Users control panel, confirm you have entered an owner name and password in the File Sharing control panel.

To create a new user account:

1. Click New User.
2. Enter the user name and password (optional).
3. Select the type of user: Normal, Limited, or Panels.
4. Click Show Setup Details.
5. Set up the login dialog box for each user by selecting an existing picture or dragging a picture from a Web browser.
6. Make additional settings.
    - User can change password: Allows the user to change the password you set and to set or change their voiceprint password.
    - Can Log In: If this is not checked, the user account is temporarily disabled.
    - Can Manage User Account: This user (account manager) can create, delete, or modify other accounts (except for the owner's). This checkbox is only disabled for a Normal user.
7. Click the close box to save your settings.

To create multiple users with the same settings:
Select a user whose settings you want to duplicate and click Duplicate.

To edit a user account:
Double-click the user name or select the user name and click Open and make the changes you want.

To set up a guest account:
Click Options, then click the Other tab and select the "Allow a Guest User Account" check box.

Mac OS 9: Audio CD Skipping

This article describes how to prevent audio CDs from skipping when using Mac OS 9.0.x or QuickTime 4.1.
This article has been archived and is no longer updated by Apple.

Symptom

When playing audio CDs, the audio will momentarily skip while using the computer.

Affected Products

- QuickTime 4.1 and a Macintosh computer with built-in USB
- Mac OS 9.0.2 and a Macintosh computer with built-in USB
- Mac OS 9.0.3 and a Macintosh computer with built-in USB
- Mac OS 9.04 and a Macintosh computer with built-in USB

All of these products contain a new version of the Sound Manager (v 3.6.4) and support digital audio CD playback.

The new Sound Manager was changed to reduce audio latency in games and DVD software. This enhancement can lead to occasional skipping of digital CD audio playback when Virtual Memory is on and a virtual memory page fault occurs (virtual memory page faults occur when physical memory is low).

Solution

Install the Multimedia Update 1.0. The Multimedia Update 1.0 is available on Apple software update sites.

This article can help you locate the software update mentioned here:

- Article 14724: "**Where To Find Apple Software Updates**" - Lists online services for free Apple software updates.

Published Date: Feb 20, 2012

How to reduce startup time (Mac OS 9 and earlier)

Learn why, when starting up, the computer pauses with a gray screen or an alternating question mark and folder displayed. This document applies to Mac OS 9 and earlier--it does not apply to Mac OS X or later. For Mac OS X startup troubleshooting, see this document.
This article has been archived and is no longer updated by Apple.
Slow startup can be caused by several things:

- The most common cause is that a valid startup disk has not been selected. Use the Startup Disk control panel to select a volume with a valid System Folder.
- If you have large amounts of memory installed in the computer, it will take the computer longer to test the memory at startup before proceeding with the startup process. You can turn off the startup memory tests by holding down the Command and Option keys while opening the Memory control panel.
- If you have installed additional extensions or startup items, this can cause a longer startup process. Avoid installing unneeded items to reduce the startup time.
- Turning on Multiple Users/Macintosh Manager can introduce delays depending on whether the machine is started up locally or over a network, or the user account has been opened before or reconfigured. To decrease startup time, try installing the latest version of the Macintosh Manager Client/Multiple Users software. For more information, consult the Macintosh Manager client documentation.
- If the computer appears to pause for an extended period of time just before the Finder loads, the computer may be trying to automatically connect to a server volume that is not available. For more information about this issue, see technical documents 17697 and 25214 (links below).

If the computer is still taking an extended period to start up after the "Happy Mac" appears, and following the guidelines above, use some of the following basic troubleshooting steps to help resolve the issue.

Troubleshooting steps

- Disconnect any third-party peripheral devices.
- Use the Extensions Manager control panel to select the OS Base or OS All extension set, and restart the computer for the changes to take effect.
- If the above helps, verify your third-party devices and/or third-party software functions normally. Maybe the startup delay is normally given your particular configuration.
- If you are still experiencing long delays in startup, a clean installation of the OS may be in order, as it's possible that a damaged or corrupted file is causing the delays.

For additional information see the following documents:

Document 58042: "**Macintosh: Flashing Question Mark at Startup**"
Document 14438: "**Macintosh: Startup Problems Q & A**"
Document 17697: "**AppleShare Volumes: Disabling Automatic Log On**"
Document 25214: "**Mac OS 9: Brief Delay When Desktop First Appears**"
Published Date: Feb 20, 2012

iMovie: Voice recording stops after 5 minutes

This article has been archived and is no longer updated by Apple.

In iMovie 5 and earlier, while adding a voice track to a movie using the Record Voice feature, the recording stops after 5 minutes.

iMovie stops Record Voice after five minutes of continuous recording. This is an intentional limit to avoid wasting disk space if a user forgets to stop the recording manually, because the Record Voice feature uses about 10 MB of hard drive space per recorded minute.

To continue recording, click the Record Voice button again. If your previous recording stopped while you were speaking, you may need to crop the audio clip. See the iMovie online Help section "Working with Audio" for more information about cropping audio clips.

Mac OS Runtime for Java 2.2: Requires Text Encoding Converter

When Mac OS Runtime for Java 2.2 (MRJ) launches, I get an error message that my system software is damaged and should be reinstalled. What could be causing this?

This article has been archived and is no longer updated by Apple.

Mac OS Runtime for Java 2.2 (MRJ) requires the Text Encoding Converter extension, which is normally part of the standard system software installation.

If this extension is not in your System Folder, you will get an error message that your system software is damaged and you should reinstall it. Reinstalling the system software will fix the issue.

Published Date: Feb 20, 2012

Mac OS Runtime for Java 2.2: Eliminating Certificates for Signed Applets

In Mac OS Runtime for Java 2.2 (MRJ), is there a way to eliminate a certificate after it has been accepted?
This article has been archived and is no longer updated by Apple.
MRJ can now accept certificates for signed applets. If you wish to eliminate a certificate after acceptance, you have two choices:

- Get MRJKey from the MRJ SDK. This tool will list the certificates and allow you delete selectively. MRJKey was left in the SDK because the user interface is not yet complete, but the application is usable. To get the MRJ SDK, go to **http://developer.apple.com/java/**.
- Delete the identitydb.obj file in the Preferences folder. This option is mentioned in About MRJ 2.2, but has the disadvantage of deleting all certificates, and requires that you reaccept the ones you really need.

Published Date: Feb 20, 2012

Macintosh: Memory Utilization Troubleshooting Chart

Macintosh memory (RAM) issues can have a number of symptoms. Below is a table of symptoms, possible causes, and troubleshooting steps.
This article has been archived and is no longer updated by Apple.

Symptom	Possible Cause	Troubleshooting Steps
When user tries to launch a program, a dialog box on screen indicates that there is not enough memory to open the program.	Memory has become fragmented.	Quit other programs in the order that you opened them and/or restart the Macintosh.
		Quit other programs that may be open.
		Turn on virtual memory (or increase its size).
		Reduce the size of the disk cache.
		Reduce the size of the RAM disk if there is one, or turn it off.
		Add more RAM to the Macintosh.
		Remove the contents of a large Clipboard. If you have a huge document sitting on the Clipboard as a result of copying, delete the contents. From the Finder, pull down the Edit menu and choose the Show Clipboard command. If a large segment of data resides in the Clipboard, simply replace it by copying a small word or a single character. The tiny piece of text will be copied to the Clipboard, replacing the huge amount of text that was there.
The application displays a dialog box warning that here is not enough memory to open the document.	Not enough memory allocated to program.	If the application has other documents open, close them.
		Increase the memory partition for the program.
	There is not enough memory to complete an operation.	Close document windows that you don't need.
		Check for a Large Clipboard.
		Increase the amount of memory allocated to the application. Remember that an application cannot occupy less memory than is designated in the Minimum size box; nor can it occupy more memory than is designated in the Preferred size box (both in the Get Info window) even if there is plenty of RAM.
		Work with smaller documents. If adjusting the memory allocation to the application successfully worked, you can also divide a very large text document into smaller separate text files.

		Streamline graphic files. You can economize on the amount of memory graphics files occupy by working on them in 72 dpi rather than 300 dpi and by using 256 colors rather than millions of colors.
Crashes occur when you run one or more specific programs, particularly older (before 1990) programs.	Program is incompatible with the Modern Memory Manager.	Obtain a newer, compatible version of the program.
User complains of slow performance. This problem is subject to user opinion. However, the user may state that performance has just recently degraded.	Virtual memory is adversely affecting performance.	Reduce the amount of virtual memory.
		Turn off virtual memory. Note, however, that turning off virtual memory on a Power Macintosh increases the amount of memory needed to run PowerPC-native programs.

iMovie: Audio Pops and Clicks

When playing a movie in iMovie, there are occasional clicks and pops in the audio portion of the DV footage..
This article has been archived and is no longer updated by Apple.

Symptom

When playing a movie in iMovie, there are occasional clicks and pops in the audio portion of the DV footage..

Solution

1. Make sure you have updated to the latest version of iMovie. Check Apple Software Downloads (http://www.apple.com/swupdates/) for information on the latest version.

2. If you are using the latest version and the issue still occurs, it's possible that you have a sound track enabled in the Appearance control panel. This can cause distortions in the audio within iMovie. Try turning the sound track off in the Sound tab of the Appearance control panel.

Published Date: Feb 20, 2012

AppleWorks: Restoring Unusable Database Document

If an AppleWorks database document will not allow new records to be added, or the document starts behaving erratically, use the following information to extract the data from the database and insert it into a new database.
This article has been archived and is no longer updated by Apple.
Important: This technique works best for databases in which all the fields are defined as text, such as an address list for mailing labels. If your database fields contain calculations or non-text field types, then you may refer to "AppleWorks: Document Recovery Techniques" for a more general process. Usually, these steps will restore the ability to create new records. The issue may persist in rare cases, following the exported data beyond the attempted restoration process. If this occurs in your case, you may have to either create a second database for additional data or recreate the database entirely.

For our example, we will refer to a database named "MyAddressBook."

Follow the steps to rebuild the database that correspond to the version of software you are using.

AppleWorks 5 and ClarisWorks 5

1. Open the affected database.
2. Choose Save As from the File menu. A dialog box appears.
3. At the top of the dialog box, use the pop-up menu to select the location where you will be saving the file. For simplicity, you may choose Desktop.
4. Near the middle of the dialog box, the text "Save As" appears. Below is a pop-up menu indicating the file type, which is most likely AppleWorks. Choose DBF from the File Type pop-up menu.
5. Below the pop-up menu appears the file name "MyAddressBook." Add a suffix of your choice to the file name. The suffix is to prevent overwriting the original file by generating a new copy. For simplicity, you may add the suffix ".dbf."
6. Click Save.
7. Close the affected database. If you are prompted to save changes, click Don't Save.
8. Choose New from the File menu. A New Document window appears.
9. Choose to open a new database document.
10. Create fields with the exact same names in the exact same order as the original database. Field names, for example, might be "name," "address," and "city/state/zip" for an address book. After creating fields, click Done.
11. Give the new database a name that distinguishes it from the original. Choose Save from the File menu. For simplicity, name the file "Myaddressbookv2." Click Save. Now, you should have a new database containing one empty record with the same fields as the original.
12. Choose Insert from the File menu. Using the dialog box that appears, navigate to the location where you saved the file MyAddressBook.dbf. Click once on the file name to select it, then click Insert.
13. Now you should see all your original data inserted into the new records. Normally, this will leave one blank record at the top of your database. You may delete the blank record by select it with the pointer then choosing Delete Record from the Edit menu. You may now save the new copy of your database.

AppleWorks 6

1. Open the affected database.
2. Choose Save As from the File menu. A dialog box appears.
3. At the top of the dialog box, use the pop-up menu to select the location where you will be saving the file. For simplicity, you may choose Desktop.
4. Near the bottom of the dialog box is a pop-up menu labeled File Format. The pop-up menu most likely says AppleWorks. Choose ASCII Text from the pop-up menu.
5. Above the File Format menu appears the Name field, which in our example would contain "MyAddressBook." Add a suffix of your choice to the file name. The suffix is to prevent overwriting the original file by generating a new copy. For simplicity, you may add the suffix ".txt."

6. Click Save.
7. Close the affected database. If you are prompted to save changes, click Don't Save.
8. Choose New from the File menu. A New Document window appears.
9. Choose to open a new database document.
10. Create fields with the exact same names in the exact same order as the original database. Field names, for example, might be "name," "address," and "city/state/zip" for an address book. After creating fields, click Done.
11. Give the new database a name that distinguishes it from the original. Choose Save from the File menu. For simplicity, name the file "Myaddressbookv2." Click Save. Now, you should have a new database containing one empty record with the same fields as the original.
12. Choose Insert from the File menu. In the dialog box that appears, navigate to the location where you saved the file MyAddressBook.txt. Choose All Available from the File Format pop-up menu. Click once on the file name to select it, then click Insert.
13. Now you should see all your original data inserted into the new records. Normally, this will leave one blank record at the top of your database. You may delete the blank record by selecting it with the pointer then choosing Delete Record from the Edit menu. You may now save the new copy of your database.

Macintosh Manager/Multiple Users: Using the Notepad and Scrapbook

Limited and Panels users cannot access the Scrapbook or Notepad, even when given access to those applications. This article lists options that allow users to have an individual Notepad or Scrapbook, or share a single global Notepad or Scrapbook.

This article has been archived and is no longer updated by Apple.

For each user to have an individual Notepad or Scrapbook

1. Make a copy of the Notepad File or Scrapbook File (located in the System Folder).
2. Place the copy where the user can access it, such as the user's Documents folder.

Note: This solution may increase network traffic for Mac OS 9 clients because they access the Notepad or Scrapbook from the server.

For all users to share a single global Notepad or Scrapbook

Method 1

1. Place a copy of the Notepad File or Scrapbook File where all users have access, such as the Shared Documents folder. This may also increase network traffic for Mac OS 9 clients.

Method 2

1. Place the Notepad file or Scrapbook file in the Special Folder.
2. Make sure that the users are allowed Read/Write access to this Special Folder from the Workgroups: Privileges window in Macintosh Manager Admin.

Note: With this configuration there is no increased network traffic, but there will be a folder on a local workstation that users have read/write access to, and may bypass a disk quota if they save files into this Special Folder.

Final Cut Pro 3: How to delete the preferences file

This document explains how to resolve issues caused by the preferences file in Final Cut Pro 3.
This article has been archived and is no longer updated by Apple.
One of the steps to follow when troubleshooting Final Cut Pro is to delete the Final Cut Pro Preferences file. Doing this restores Final Cut Pro to the settings you made when you installed the application. In Mac OS 9, the Final Cut Pro Preferences file is located in the Final Cut Pro Data folder within the Preferences folder, within the System folder. See Figure 1. In Mac OS X, it is located in the users Preferences folder (~/Library/Preferences/Final Cut Pro User Data) See Figure 2. This file contains user preferences for scratch disk settings, capture settings, window layouts, and so forth.

Figure 1 Final Cut Pro Preferences file in Mac OS 9

Figure 2 Final Cut Pro Preferences in Mac OS X

The preferences file can sometimes contain incorrect information, resulting in Final Cut Pro exhibiting unpredictable behaviors. This is easily fixed by following these steps:

Mac OS 9

1. Quit Final Cut Pro.
2. Drag the file **Final Cut Pro Preferences** from `System Folder:Preferences:Final Cut Pro User Data:`
3. Drag the file **Final Cut Pro MOA Cache** from `System Folder:Preferences:Final Cut Pro User Data:`
4. Open Final Cut Pro.

Important: Do not delete any of the other files in the Final Cut Pro User Data folder than the ones specified above in the Mac OS 9 section.

Mac OS X

1. Quit Final Cut Pro.
2. Drag the file **Final Cut 3.x Preferences** from `~/Library/Preferences/Final Cut Pro User Data/`
3. Drag the file **Final Cut Pro MOA Cache** from `~/Library/Preferences/Final Cut Pro User Data/`
4. Drag the file **com.apple.FinalCutPro.plist** from `~/Library/Preferences/`
5. Open Final Cut Pro.

Important: Note: Do not delete any of the other files in the Final Cut Pro User Data folder than the ones specified above.

Depending on the situation, you may need to restart your computer. Once this process is completed Final Cut Pro reverts to its installed defaults. Reset all of your desired application preferences to match what they were before--in particular your Scratch Disk Preferences, and the selected Sequence Settings.

To avoid recreating all your custom settings in the event you have to delete the preferences file again, follow these steps to save a clean copy of the file:

1. Make a duplicate of the Final Cut Pro Preferences file immediately after it is installed and configured for the first time.
2. Put the file in a safe place.

If you have to delete the preferences file again, you can simply replace it with a duplicate of the saved, clean file. This preserves your desired preference settings, while eliminating any unwanted behaviors that may have been caused by a faulty Final Cut Pro Preferences file.

AppleWorks 6: Importing AppleWorks 5 Clippings Libraries

This article explains how to import clippings from AppleWorks 5 into AppleWorks 6.
This article has been archived and is no longer updated by Apple.
As described in AppleWorks 6 Help, you can import clippings libraries from AppleWorks 5 or ClarisWorks 5 into the AppleWorks 6 clippings palette. However, you must drag the individual AppleWorks 5 clipping library files into the root level of the AppleWorks 6 Clippings folder for the library to show up in the Clippings palette in AppleWorks 6.

Figure 1 Drag the individual library files directly into the AppleWorks 6 Clippings folder

Do not drag install the AppleWorks 5 Library folder, or its subfolders. Do not drag the AppleWorks 5 clippings libraries into subfolders of the AppleWorks 6 Clippings folder. If you put AppleWorks 5 library files into subfolders of the AppleWorks 6 Clippings folder, they will not appear in the AppleWorks 6 Clippings window.

When the libraries are installed correctly, a new, locked tab will appear in the AppleWorks 6 Clippings window for each imported AppleWorks 5 library.

Figure 2 Note the imported, locked tab which represents the imported AppleWorks 5 library

Power Mac G4: Installing Update for AppleShare IP 6.1

The Power Mac G4 requires Mac OS 9 and AppleShare IP 6.3 or later, but my AppleShare IP installation CD is version 6.1. After installing Mac OS 9, I ran the AppleShare IP installer, and received the message: "The selected disk does not contain Open Transport 1.3 or later." How can I install AppleShare IP?
This article has been archived and is no longer updated by Apple.
The Open Transport 1.3 error message is erroneous, since any computer with Mac OS 9 includes Open Transport 2.5 or later.

Before proceeding, download the applicable AppleShare IP updater. You can run AppleShare IP 6.3 with Mac OS 9, but AppleShare IP 6.3.1 and Mac OS 9.0.4 are recommended. To find the most recent version of this software, please see Apple Software Updates available at http://www.apple.com/swupdates/ .

To install AppleShare IP on a Power Mac G4 computer, follow these steps:

1. Insert the AppleShare 6.1 CD.
2. Find and open the folder "Software Installers" located on the CD.
3. Open the folder "Install AppleShare IP 6.1" located on the CD
4. Scroll down to the folder "Extension Items" and open it.
5. Open the Extensions folder in the System Folder on the disk on which you want to install AppleShare IP.
6. Select all the files in the Extension Items folder on the CD except "Apple Enet" and drag them to the Extensions folder on the destination volume.
7. Without restarting, open the AppleShare IP 6.3 installer or 6.3.1 updater application.
8. Install the software.
9. After you have installed the update, restart the computer.
10. Open the AppleShare IP Setup application to configure your server.

iBook, PowerBook (FireWire): How to Delete the Memory Contents File

This document explains how to delete the Memory Contents file on a computer that has had the Preserve memory contents on sleep option enabled in the Energy Saver control panel.
This article has been archived and is no longer updated by Apple.
Note: For compatibility reasons, the Preserve Memory Contents on Sleep feature has been removed in Mac OS 9 versions 9.0.4 and later. You may still see the option in the Energy Saver control panel but it will be dimmed.

The Memory Contents file is created by the Preserve memory contents on sleep option in the Energy Saver control panel. It can be rather large. (The size of the file depends on the amount of memory installed in a computer.)

After installing the Sleep Memory Extension or Mac OS 9.0.4, the Preserve memory contents on sleep checkbox in the Energy Saver control panel is dimmed and unavailable. However, the Memory Contents file created by this feature is not deleted. It is safe to delete this file and reclaim the hard disk space it takes up.

The Sleep Memory Extension, and Mac OS 9.0.4 Update are available from Apple Software Downloads (http://www.apple.com/swupdates/).

To delete the Memory Contents file:

1. Choose Sherlock 2 from the Apple menu.
2. Click Files.
3. Click Edit to open the More Search Options window. See Figure 1.
4. Click the file name checkbox.
5. Choose contains from the pop-up menu, and type "Memory" in the field next to this menu.
6. In Advanced Options click the "is" checkbox and choose invisible from the pop-up menu.
7. Click OK.

Figure 1: More Search Options Window

8. Click Search.

Figure 2: Sherlock 2 Window

9. Choose Move to Trash from the File menu. A warning dialog appears to let you know that the file must be deleted immediately.

Figure 3: File Menu Window

10. Click OK.

AppleWorks: AppleWorks 6 Updater Log Error

After updating AppleWorks 6 to version 6.0.4, the AppleWorks 6 Updater Log file contains a line that says:

Update Error: -14

This article has been archived and is no longer updated by Apple.
This error is inconsequential. You can use AppleWorks 6.0.4 normally.

The AppleWorks 6.0.4 Updater is designed to update both the North American English and International English versions of AppleWorks 6. When the updater is opened, it attempts to update both versions. The Update Error: -14 error occurs when the updater tries to update the English version of the AppleWorks software that is not installed on your computer's hard disk.

PowerBook Firmware Update 2.4: Read Me

This article contains the read me for the PowerBook Firmware Update 2.4 released on 2000-05-30.
It can be downloaded from the Apple Software Updates Web site at http://www.apple.com/swupdates/.
This article has been archived and is no longer updated by Apple.

About the PowerBook Firmware Update 2.4

The PowerBook Firmware Update 2.4 will only run on PowerBooks with built-in FireWire ports using Mac OS 9.0 or later.

Firmware updates are also available for iBooks, iMac computers with slot-loading CD or DVD drive, and Power Mac G4 models with AGP graphics.

The PowerBook Firmware Update 2.4 improves support for using a USB storage device, such as an external hard drive as a startup disk. For PowerBooks with built-in FireWire ports using Mac OS 9.0.4 or later, this update also allows you to use a FireWire storage device, such as an external hard drive, as a startup disk. There is also improved support for FireWire target disk mode.

Before you install the PowerBook Firmware Update 2.4, read the instructions below. You may want to print them for reference.

Note: After you install this update, the PRAM is reset. This may reset some of your control panels to default settings. See Mac Help, available in the Help menu, for more information on changing your control panel settings.

1. Make sure your PowerBook's power cord is connected and plugged into a working power source.

2. Double-click the PowerBook Firmware Updater icon.

Note: If a message says your firmware is up-to-date with version 2.4 of the PowerBook Firmware Updater, or that this version of the PowerBook Firmware Updater will not run on this computer, then you do not need this update. If a message says you need to install Mac OS 9.0, the firmware updater will not run until you install Mac OS 9.0 or later.

3. Follow the onscreen instructions. When prompted, click Shut Down in the dialog box to shut down your PowerBook.

4. After the computer has shut down, hold down the Command (Apple) key and Power button to start up your PowerBook.

5. Continue to hold down the Command key and Power button until you hear a long tone. Release the Command key and Power button when you hear the tone. The update starts automatically.

A status bar shows the progress of the update. When a message says your PowerBook's firmware has been successfully updated to version 2.4f1, you are finished.

Note: If a message says the update was not completed successfully, review the instructions and begin the update process again.

For more information, see www.apple.com/support

Final Cut Pro: Avoiding Rendering of Audio Clips When Using Filters

This article describes a technique that may be used to avoid constantly re-rendering audio clips with filters that need to be edited frequently.
This article has been archived and is no longer updated by Apple.
In order to avoid constant re-rendering when editing filtered audio clips, you can isolate these clips into "nested" sequences. A nested sequence refers to a sequence that's edited into another sequence as if it were another clip of media. The advantage is that once the filtered audio clip is isolated and rendered within its own sequence, subsequent editing of the in and out points of the nested sequence don't affect the clip's render file.

Although this could be done by manually creating a new sequence, cutting and pasting the filtered audio clip into it, and then editing this new sequence to replace the original clip, there is a shortcut. Using the Sequence> Nest Items" menu item essentially does these things automatically.

Figure 1 shows an example sequence with just such a situation. A filter is applied to the audio clip named "Interview." The in point was changed, after first rendering it for playback, resulting in the loss of the render file and the need for re-rendering, indicated by the red bar above the timeline.

Figure 1: A multiple track edit, with an audio filter applied to the clip named "Interview"

To avoid the necessity of multiple renders in situations like this, follow the steps below:

Step One
Click on the audio clip that requires rendering to select it (the "interview" clip, in this situation), and then choose "Nest Items" from the Sequence menu. See Figure 2.

Figure 2: The Nest Items Menu

Step Two
This results in the Nest Items dialog box appearing. Enter a name, and enable the "Mixdown Audio" check box. This automatically renders the sequence as it replaces the original clip in your timeline. See Figure 3.

Figure 3: The Nest Items dialog box, with Mixdown Audio enabled

Step Three
You should see something similar to figure 4, with the rendered sequence named "Audio Effects 1" taking the place of the original audio clip. Notice that the red rendering bar has now turned grey as a result of enabling the "Mixdown Audio" checkbox. The in and out points of this sequence clip may now be edited at will, with no need for further rendering.

Figure 4: The finished edit, with the Audio Effect 1 sequence taking the place of the original filtered "interview" clip

Power Mac G4 (AGP) & Servers: Unreadable Text in Certain Control Panels and Contextual Menus

This article describes a situation where text in certain control panels and contextual menus is unreadable.
This article has been archived and is no longer updated by Apple.

Symptom

Certain Mac OS control panels, such as Text and Sound, may exhibit unreadable text. Also, the use of contextual menus may result in unreadable text, the system may stop responding, or display system errors.

Note: This issue only appears on certain Power Macintosh G4 (AGP) computers with a 500 MHz microprocessor and Mac OS 9.0.2 installed.

Ways to detect

1. Open the Text control panel and click the Behavior pull down menu. See Figure 1.
2. Go to the Sound control panel and select Alert Sounds. See Figure 2.
3. Open a contextual menu.
   To open a contextual menu, press and hold down the Control key, while pointing to an item on the desktop and pressing and holding the mouse button.

Samples of the unreadable text:

Figure 1 Text control panel

Figure 2 Sound control panel

Solution

Rebuild the desktop and update the system software to Mac OS 9.0.4.

For instructions on how to rebuild the desktop, refer to article 10182: "**Rebuilding Desktop File and Icon Recovery**"

Use the Software Update control panel to download and install Mac OS 9 Update (9.0.4), if you are running Mac OS 9. You can also download the Mac OS 9 Update (9.0.4) from Apple Software Updates at **http://www.apple.com/swupdates**

Published Date: Feb 20, 2012

Mac OS 9.0.4: Some Display Resolutions Missing

This article discusses an issue with Mac OS 9.0.4 and missing display resolutions on some NuBus computers and non-PCI PowerBooks.
This article has been archived and is no longer updated by Apple.

Symptom

When using Mac OS 9.0.4 on some NuBus computers and non-PCI PowerBooks, display resolutions previously available may no longer appear in the Monitor Resolution control strip or Monitors control panel.

Solution

Install Video Extension 1.0, which can be downloaded from the Apple Software Updates Web site at http://www.apple.com/swupdates.

This Video Extension update restores access to all available resolutions with built-in video and video cards on NuBus computes and non-PCI PowerBooks.

Color StyleWriter 4000 Series: Error When Using ColorSync 3.x Color Matching

This article discusses an issue with the Color StyleWriter 4000 Series Drivers and ColorSync 3.x.
This article has been archived and is no longer updated by Apple.

Symptom

An error message appears when printing a document to a Apple Color StyleWriter 4000 Series Printer with ColorSync selected as the Color Matching method. The specific error message displayed varies somewhat depending on the application you are printing from.

Example error messages

SimpleText and Claris Emailer may display two error messages:
Message 1: "status of " document_name": a printing error occurred (-4)."
Message 2: "SimpleText is unable to print this document. Please use the Chooser to select a printer. OK"

Photoshop
"Could not print "document_name" because of a program error. OK"

Microsoft Internet Explorer
"The Application "Internet Explorer" has unexpectedly quit, because an error of type 3 occurred. You should save your work in other open applications and restart the computer."

Products affected

- Color StyleWriter 4000 Series printer drivers
- ColorSync 3.0
- Mac OS 9.0

Solution

When printing to a Color StyleWriter 4000 Series printer from a Macintosh running Mac OS 9, do not use the ColorSync Color Matching option. Use the following steps to select a different option.

1. Choose Print from the File menu. (The Color StyleWriter Print dialog appears.)
2. Click Options. (The Options dialog appears.)
3. Choose a different Color Matching option, such as Auto, from the Color Matching pop-up menu.
4. Click OK. (The Print dialog reappears.)
5. Click Print to print the document.

Note: The default Color Matching setting is Auto so you would not see this error unless the default setting has been changed. Any Color Matching setting you choose for a document is saved with that document.

Mac OS: Limited Access to Folder Named "Users"

When Multiple Users is active, access privileges to folders named "Users" on the root level of all disks are limited.

This article has been archived and is no longer updated by Apple.

Symptom

When Multiple Users is active folders do not appear in any folder named "Users" that is located on the root level of a disk.

Multiple Users automatically restricts access to any folder named "Users" or "users" on the root level of any disk (including file server volumes). Multiple Users treats any folder named "Users" on the root level of a disk as if it is the primary Users folder where Multiple Users stores documents and preferences. All folders (except one named the user's name) in any folder named "Users" on the root level of a disk are invisible to all Multiple Users users.

Products affected

- Multiple Users (Mac OS 9 standalone)
- Multiple Users (using any version of Macintosh Manager server)

Solution

- Move the folder named "Users" from the root level of the shared disk to another folder (Macintosh HD: Another Folder: Users).
- Rename the folder to something other than "Users" or "users".

Published Date: Feb 20, 2012

LaserWriter 8: HP LaserJet 2100TN Requires New PPD to Print Collated Copies

This article discusses an issue printing collated copies on a Hewlett-Packard (HP) LaserJet 2100TN printer using LaserWriter 8.
This article has been archived and is no longer updated by Apple.

Symptom

The Hewlett-Packard (HP) LaserJet 2100TN printer does not collate printed documents. It prints each page the number of times specified, but it does not collate them.

Solution

Download HP LaserJet 2100 Series PPD version1.3 or later-part of "HP LaserJet Family LaserWriter Driver 9.0" software-from Hewlett-Packard's Web site at http://www.hp.com/ .

After downloading the software, open the Installer and perform a custom installation of "All Printer Descriptions." This places the HP LaserJet 2100 Series v1.3 PPD in the Printer Description folder in the Extensions folder.

Set up the LaserJet 2100 Desktop Printer to use the new PPD:

1. Click the printer's Desktop Printer icon to select it. (The Printing menu appears in the menu bar.)
2. Choose Change Setup from the Printing menu. (The setup window appears.)
3. Click Auto Setup.
4. Click OK when completed.

Alternatively:

1. Drag the printer's Desktop Printer icon to the Trash.
2. Use the Chooser to create a new Desktop Printer.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

The following article can help you search for a particular vendor's address and phone number:

LaserWriter 8.7: Duplex Printing on Letterhead Paper

Using LaserWriter 8.7 and the duplex option to print on letterhead paper may yield unanticipated results.

This article has been archived and is no longer updated by Apple.

Symptom

Using LaserWriter 8.7 and the duplex option to print on letterhead paper may yield unanticipated results.

Solution

Some Apple LaserWriter printers have optional duplex printing units, which allows printing on both sides of the paper. This is called duplex printing or two-sided printing.

With the duplex option installed, a single-sided print job will always start from the same side of the paper, top or bottom, depending on the printer. However, a two-sided print job starts printing on the opposite side of the paper from a single-sided print job.

When using the duplex option to print on letterhead paper, the letterhead paper must be oriented in the paper cassette according to the print job, whether it is a single-sided or two-sided print job.

If the printer has multiple cassettes and depending on the print job, the letterhead paper may need to be oriented differently in each paper cassette.

Published Date: Feb 20, 2012

Apple Software Restore: Set up LaserWriter 8 Software After Restoring

After restoring software, you must set up the LaserWriter 8 printer software before printing.
This article has been archived and is no longer updated by Apple.
Some computers come with a Software Restore CD that contains the Apple Software Restore application. This application restores all of the computer's original software, including the system software, factory settings, and applications.

After restoring software, you must set up the LaserWriter 8 printer software before printing, or an error will result.

Example error messages include:

> "The document "document_name" could not be printed, because no printer has been selected. Please use the Chooser to select a printer. OK"
>
> "Application_name' is unable to print this document. Please use the Chooser to select a printer. Cancel"

Restore options

Note: If your computer came with both Mac OS 9.1 and Mac OS X installed on the hard disk, you should follow the restore procedure outlined in Article 60847 "**Apple Software Restore: How to Perform a Multiple Disc Restoration**"

Erase "your_hard_drive" before restoring
This option completely erases the contents of the hard disk before restoring the original contents.

To use your Apple LaserWriter, set up your printer as you would normally using the Chooser, Desktop Printer Utility, or the Mac OS Setup Assistant. For assistance configuring your printer, search for "Selecting a printer" in the Help Center.

Restore in Place
This option replaces the original software (original system software, factory settings, and applications that came with the computer) with new copies from the Software Restore CD, leaving everything else on the hard disk unchanged.

Using this option your Apple LaserWriter Desktop Printers are visible on the desktop, or in whatever folder they were stored in prior to restoring any software. However, you need to set up your Desktop Printer prior to printing to it.

To set up the printer, follow these steps:

1. Click the Desktop Printer's icon to select it.
2. Choose Set Default Printer from the Printing. (For the default printer only.)
3. Choose Change Setup from the Printing menu. (A LaserWriter setup dialog appears.)
4. Click Auto Setup if you are configuring an AppleTalk printer, or click Change and select the PPD for printers connected via IP.
5. Repeat steps 1, 3 and 4 for each of your Desktop Printers.

Restore, saving original items (a new option in Apple Software Restore 2.x)
This option copies all files on your hard disk to a folder named "Original Items" then restores the original contents (original system software, factory settings, and applications that came with your computer).

This option moves any Desktop Printer icons into the Original Items folder. Move any Desktop Printer icons to the desktop, and follow steps 1 through 5 above.

When Setting Up Third Party PostScript Printers
The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of individual printers. PPD files contain information about individual PostScript printers such as the paper-handling capabilities, the number of paper trays, their capacity, and the paper sizes they handle.

When using LaserWriter 8 printer software to print to a third-party PostScript printer, obtain a copy of the printer's PPD file from the vendor. Copy this file into the Printer Descriptions folder, then follow the appropriate procedure listed above. You can also use the Generic PPD with a third-party printer, but all of the printer's options may not be available.

Published Date: Feb 20, 2012

QuickTime Streaming Server: Configuration File Syntax Changed in Version 2.0.1

This article describes a change in the way configuration files are created using QuickTime Streaming Server 2.0.1.

This article has been archived and is no longer updated by Apple.
In QuickTime Streaming Server 2.0.1 (QTSS), the syntax of the configuration files has changed. When entering a string that contains spaces in a configuration file, the string must be enclosed in quotation marks.

QuickTime Streaming Server 2.0 syntax

- relay_source in_addr=224.98.98.45 src_addr=17.98.45.45 in_ports=5000 5002 5004 ttl=15
- relay_destination dest_addr=17.254.98.45 out_addr=17.98.45.45 dest_ports=1980 1982 1984
- relay_destination dest_addr=226.91.45.78 out_addr=17.98.45.45 dest_ports=10010 10012 10014 ttl=15

QuickTime Streaming Server 2.0.1 or later syntax

- relay_source "in_addr=224.98.98.45 src_addr=17.98.45.45 in_ports=5000 5002 5004 ttl=15"
- relay_destination "dest_addr=17.254.98.45 out_addr=17.98.45.45 dest_ports=1980 1982 1984"
- relay_destination "dest_addr=226.91.45.78 out_addr=17.98.45.45 dest_ports=10010 10012 10014 ttl=15"

If QTSS has been updated to QTSS 2.0.1 from an earlier version, existing configuration files must be edited manually to include the necessary quotes.

- The path to the QTSS Relay configuration file is: /etc/qtssrelay.conf
- On Darwin Streaming Server platforms, the path to the default Relay file is: /etc/streamingrelay.conf

Mac OS: Setting the Clock for Daylight-Saving Time in Australia

This article explains how to manually set the computer's clock in the Date & Time control panel in order to accommodate the one-time change in start date for daylight-saving time in 2000.

This article has been archived and is no longer updated by Apple.
Normally, the computer's clock automatically changes from standard time to daylight-saving time. In 2000, however, several states and territories of Australia changed the start date of daylight-saving time to accommodate the Olympic Games in Sydney. The Mac OS Date & Time control panel was not programmed to change to daylight-saving time for this one-time event. Follow the steps below to manually set up the Date & Time control panel for daylight-saving time.

State or territory	Change to daylight-saving time	Change to standard time
South Australia	2000-10-29	2001-03-25
Victoria	2000-08-27	2001-03-25
Australian Capital Territory	2000-08-27	2001-03-25
New South Wales	2000-08-27	2001-03-25
Tasmania	2000-08-27	2001-03-25

- Clocks are advanced at 02:00 by one hour on start date for daylight-saving (summer) time.
- Clocks are wound back at 03:00 by one hour on end date for standard time.

Setting the computer's clock using the Date & Time control panel (Mac OS 8.5 or later)

1. Open the Date & Time control panel.
2. Click Set Time Zone.
3. Select the closest city in your time zone.
4. Click OK.
5. Click the checkbox to deselect the "Set Daylight-Saving Time Automatically" option.
6. Click the checkbox to select the "Daylight-Saving Time" option.
7. Close the Date & Time control panel.

After the special daylight-saving schedule is over on 2001-03-25, or if you leave any part of the country affected by this schedule prior to that date:

1. Open the Date & Time control panel.
2. Click Set Time Zone.
3. Select the closest city in your time zone.
4. Click OK.
5. Click the checkbox to select the "Set Daylight-Saving Time Automatically" option.
6. Close the Date & Time control panel.

AppleWorks 6: Opening Files Stored on a NetWare Server

An alert box may appear when you open an AppleWorks 6 file stored on a NetWare server.
This article has been archived and is no longer updated by Apple.

Symptom

When opening a document stored on a NetWare server, an alert box appears with a message that says the document is damaged and cannot be opened.

Solution

The files are not actually damaged. Download and install AppleWorks 6.1.2 Update from Apple Software Updates (http://www.apple.com/swupdates/).

If you cannot download the update immediately, you may use these workarounds:

- Remove the ProSoft client and connect to the NetWare server using AppleTalk.
- Copy the document to your computer's hard disk before opening it. When you're finished working with the document, save it to the computer's hard disk and then copy it to the NetWare server volume.
- Save your documents in AppleWorks 5 format.

Macintosh Manager: How to Set up Netscape Communicator Preferences

This document discusses how to set up Macintosh Manager and Netscape Communicator to allow users to update their bookmarks and preferences and have them retained regardless of the version of Mac OS on a client computer.
This article has been archived and is no longer updated by Apple.
By default, Netscape Communicator creates and stores user profiles in the Preferences folder on the local hard disk. The name and location of each profile is recorded in a file named Netscape Registry within the Preferences folder. If Netscape Communicator does not find this file when it opens, it wants to create a new profile. Macintosh Manager handles preferences differently, storing user preferences in individual Preferences folders on the server instead of using the Preferences folder on the workstation. Because of this difference, you must either create a new profile for every account or use Managed Preferences to supply a default profile the first time each user logs in. Managed Preferences is also needed to preserve changes to Netscape settings when you are using Mac OS 8.6 or earlier on your Macintosh Manager clients.

Follow the instructions below to create a default Netscape User profile, configure Managed Preferences to provide the default profile to all users, and select the correct profile location for each user. This will allow users to access and update their Netscape settings regardless of the version of Mac OS installed on the Macintosh Manager workstations. If you are not familiar with the Managed Preference Model, you should read technical document 106297, "**Macintosh Manager: The Managed Preference Model"** before continuing with this document.

Setting up Macintosh Manager and Netscape

Follow the steps below to set up Netscape Communicator for Macintosh Manager.

1. If there are any Macintosh Manager clients using Mac OS 8.6, select Copy only Internet preferences or administrator-defined preferences from the Global: Security tab in the Macintosh Manager Admin application (see Figure 1).

   This enables the Preserved Preferences feature for Mac OS 8.6 clients. Mac OS 9 clients do not use Preserved Preferences.

Figure 1 Preference Management window

2**.** Create the Managed Preferences folders.

   Create a User and Workgroup, and log in once. This creates the Managed Preferences folders in the sharepoint selected for group document storage for this Workgroup (also called the Workgroup Data Volume), by default Macintosh Manager folder on the server's hard disk.

3. Open Netscape Communicator on any client (in System Access).

   When Netscape Communicator opens the first time, it asks you to create a user profile. This will be the default profile for all Macintosh Manager users. You can name it anything you like. Once the profile has been created, you may add bookmarks and set application preferences such as home page location.

4. Place files into the Managed Preferences folders.

   Netscape Communicator records the location of user profiles in the Netscape Registry file. The Netscape Users folder and the Netscape Registry file are located in the Preferences folder on the workstation hard disk. Place a copy of each in the Initial Preferences folder on the Macintosh Management Server.

   If you are using any OS 8.6 workstations, or if you are using OS 9 workstations with Macintosh Manager 2.1.1 and the MMLocalPrefs extension, place another copy of the Netscape Registry file in the Preserved Preferences folder.

   Important: Do not place a copy of the Netscape Users folder into the Preserved Preferences folder. Doing so causes Macintosh Manager to replace the users' profiles on the server with whatever profiles it finds on the workstation.

Figure 2 Initial Preferences folder

5. For each user, log in to Macintosh Manager from any workstation that does not have previously created Netscape preferences and open Netscape.

If you use the workstation where you created the default profile, you must remove the Netscape Users folder from the local Preferences folder.

When Netscape opens, you are prompted to choose the Netscape Profile since the pre-configured user profile you created cannot be found in the Preferences folder on the workstation hard drive (See figure 3). Click Choose and then navigate to the Macintosh Manager user's Preferences folder on the Server (figure 4). A copy of the Netscape Users folder is already present. Open the folder and select the folder with the name of the default profile (figure 5).

If Netscape opens without asking you to select a profile, the Macintosh Manager workstation you are using has Netscape preferences already configured. Remove them and try again.

Figure 3

Figure 4

Figure 5

6. Quit Netscape and log out of Macintosh Manager.

The Netscape Registry has been updated with the location of that user's copy of the default profile. Netscape will now look to the user's Preferences folder on the Macintosh Manager server for its settings, no matter which version of Mac OS is installed on the client. As long as the Netscape Users folder is not copied into the Preserved Preferences folder, the Netscape preferences will be updated directly on the server, even from workstations running Mac OS 8.6 or earlier (or from OS 9 workstations using Macintosh Manager 2.1.1 and MMLocalPrefs).

iMac (Summer 2000): Wavy or Flickering Picture on the Screen

The picture on the screen of some iMac (Summer 2000) computers may flicker or appear wavy.
This article has been archived and is no longer updated by Apple.

Symptom

Video "shadow bars" cascade down the computer's screen, causing the picture to flicker or appear wavy.

Solution

If possible, move your iMac computer to a different location to see if the condition still exists. This eliminates the possibility of environmental interference coming from objects such as metal desks/shelves, fluorescent lights, stand-alone speakers or electrical appliances.

If your iMac still has this issue, please take it to an Apple Authorized Service Provider for repair.

Note: The parenthetical product description (Summer 2000) refers to the summer of the Northern Hemisphere.

AppleWorks 6: Equation Editor Symbol Font Error

When opening the Equation Editor, an alert box appears with an error message that says the Symbol font installed is not Equation Editor's.

This article has been archived and is no longer updated by Apple.

Symptom

When opening the Equation Editor, an alert box appears with the following message:

> "The TrueType Symbol font in the font suitcase Symbol inside the Fonts folder is not Equation Editor's. You must install Equation Editor's version of this font if you want to use TrueType. See Chapter 2 of the Equation Editor User Manual for more details." (See Figure 1.)

Figure 1 Equation Editor alert box

Solution

This message can be ignored. The version of Symbol font installed by Mac OS 9 contains all of the elements required for Equation Editor to function normally.

Published Date: Feb 20, 2012

Macintosh Manager 1.0 to 1.4.1: Saving Workgroup Documents to Another Volume

This article explains how to set up a workgroup's Documents folder on a volume other than the designated Macintosh Management volume. It also addresses different ways you can connect to volumes for use within the Macintosh Manager environment.
This article has been archived and is no longer updated by Apple.

Preparing to work with Macintosh Manager

The steps presented here require that you know how to set AppleShare privileges in AppleShare IP or Mac OS X Server (whichever you use). For general questions about setting privileges, see:

Article 60612: "**AppleShare IP 6.3: About Sharing, Share Points, and Access Privileges.**"

For explicit instructions on using the Mac OS Server Admin application to set privileges, choose AppleShare Help from the Help menu. Users of Mac OS X Server may review:

Article 60063: "**Mac OS X Server: Using Apple File Services Remote Administration**."

For related Macintosh Manager information and definition of the terms "authentication server," "volume," and "share point" that appear in this article, see:

Article 106031: "**Macintosh Manager: Ways to Mount Volumes.**"

Items that must be copied

Documents folder
By default, Macintosh Manager saves all user documents on the designated Macintosh Manager authentication server. When you change the location of a workgroup's Documents folder to a different volume, any documents previously saved within a Macintosh Manager share point on the authentication server remain where they were--they are not automatically copied to the new location. These documents must be manually copied to the new share point.

Managed Preferences
Each Macintosh Manager volume has its own set of Managed Preferences. If you are using Managed Preferences, you need to copy the Managed Preferences folder to the new volume or create new preferences.
Setting up a new volume

To select a different volume, follow the steps below:

1. **Open the Macintosh Manager Administration application.**
2. **Click the Workgroups Tab.**
3. **Choose the Workgroup to be edited.**
4. **Click the Options tab.**
5. **Choose Other from the Designated Macintosh Management server pop-up menu. The Select Server Volume window appears.**

Figure 1 Select Server Volume window

6. Click Chooser to connect to the volume you want the User's documents to be stored on.

There are two ways this can happen:

A. If the volume is located on the Macintosh Manager authentication server, select the file server in the Chooser (note that you are already logged in) and click OK. You are then presented with the other volumes to which Macintosh Manager has access privileges.

Figure 2 Chooser window

If you don't see the volume to which you are trying to connect, the privileges for that volume may not be set correctly. You should create a new user for each Documents Volume and assign that user as the Owner with read-write access. Then assign the Multiple Users User (or Macintosh Manager User for OS X Server) in the User/Group field with read-write access. If you do not do this, the Macintosh Manager admin application will not be able to connect to (mount) the volume to make changes later.

B. If the volume is located on a server other than the Macintosh Management server, select the file server in the Chooser, type in the user name and password that you want Macintosh Manager to use when connecting to the volume, and select the volume.

7. In the Select Server Volume window, select the volume on which you want to store the documents.

Figure 3 Select Server Volume window

The designated Macintosh Manager server has changed to the volume you selected.

Figure 4 Groups Documents Stored on Volume window

8. Select how the users will log in. This depends on how you originally connected to the volume.

If the volume is located on the Macintosh Manager authentication server, choose "Log in automatically as the following AFP user," then type in user name and password that was created for this Documents Volume, from Step 6-A.

Important: You should assign a different user (as created in Step 6-A) for each Documents volume that resides on the Macintosh Manager authentication server.

Note: When using this method to set up access to a volume which is local (physically connected) to the Macintosh Manager authentication server, users who belong to more than one workgroup will not be able to switch between them while logged on. In other circumstances this may be possible via the Macintosh Manager icon in the Menu Bar. Users affected by this may switch workgroups by logging off and logging back on to the new workgroup.

Figure 5 Server login window

If you connect to a volume from a server other than the Macintosh Manager authentication server, either type in the same user name and password used in Step 6-B, or click "Require users to complete the log-in dialog." If you select this option, users are prompted to log in to the server before receiving their documents.

8. Click Save and Test.

If you see an alert box with an error message that your documents can't be accessed at this time, be sure to read the error message for any helpful information. If access to the server was denied, your access privileges may not be set correctly.

Published Date: Feb 20, 2012

QuickTime 5 Public Preview: Error Message on Restart After Installation

After installing QuickTime 5 Public Preview and restarting the computer, you may see an alert box with the error: "Some of your QuickTime components failed to load because they are out of date."

This article has been archived and is no longer updated by Apple.

Symptom

After installing QuickTime 5 Public Preview and restarting the computer, you see an alert box with the error: "Some of your QuickTime components failed to load because they are out of date."

If you accept the option to try to update the software again, the update fails and the error appears again the next time you restart the computer.

Solution

1. Open the QuickTime Installer application.
2. Choose the Custom option to uninstall QuickTime 5 Public Preview.
3. Reinstall QuickTime 5 Public Preview.

WebObjects 4.x: _BridgeClassgenInitialization Errors

This article discusses runtime exceptions that may happen when Objective-C/WebScript applications are integrated with Java frameworks for the first time.

This article has been archived and is no longer updated by Apple.

Symptom

When you integrate a Java framework into an Objective-C/WebScript WebObjects Application you might see errors such as these when you run the application:

- TestApp [PID] ObjCJava: while loading ObjCJava (ObjCJava)::
- TestApp [PID] _BRIDGEClassgenInitialization: ASSERTION FAILURE
- TestApp [PID] RAISING EXCEPTION name: NSInternalInconsistencyException
- TestApp [PID] reason: _BRIDGEClassgenInitialization: somebody else is using our NSClassFromString() hook!
- TestApp [PID] description: _BRIDGEClassgenInitialization: somebody else is using our NSClassFromString() hook

Solution

This error is caused by the Java bridge not being initialized. The Objective-C/WebScript application does not know there is a Java framework added to it and does not load the Java bridge Initialization code. When the application comes to the Java code it raises an exception as seen above.

Follow these steps to resolve this issue:

1. Make sure that your Java framework is of type "WebObjects Framework" instead of "Frameworks". The WebObjects framework type has support for Java.

2. In the Makefile.preamble file of your Objective-C/WebScript application uncomment the line:

```
JAVA_AWARE = YES
```

3. Do a Clean Build of the application and the Java Bridge should be correctly initialized.

Published Date: Feb 20, 2012

WebObjects 4.x: Issue Opening Netscape Browser on Windows NT

This article discusses how to resolve an issue opening a Netscape browser when running a WebObjects application.

This article has been archived and is no longer updated by Apple.

Symptom

If your default browser is Netscape and you open a WebObjects application with the Netscape browser already open, the browser window comes forward (or maximizes if it was minimized). The window does not become active and the meta refresh URL for the application you opened never gets posted. You have to go into the Launch Panel of Project Builder and cut and paste the URL from there to the browser's URL field.

Solution

There are two solutions depending on how the browser window is opened.

To bring up a new window every time the application runs

1. Open the Windows NT Explorer.
2. Choose Options from the View menu.
3. Click the Files Type tab.
4. Scroll to "Netscape Hypertext Document" option, select it, and click Edit.
5. In the Actions view, double-click the "Open" action.
6. In the window that opens, unselect the "Use DDE" checkbox.
7. Close all the windows.

To reuse an open browser window every time the application runs

1. Open the Windows NT Explorer.
2. Choose Options from the View menu.
3. Click the Files Type tab.
4. Scroll to "Netscape Hypertext Document" option, select it, and click Edit.
5. In the Actions view, double-click the "Open" action.
6. In the window that opens, type"NSShell" instead of "Netscape" in the Application field of the "Use DDE" group.
7. Close all the windows.

Network Assistant 4.0.1: Bus Error at System Startup Time

This article discusses a bus error that occurs when the Network Assistant system extension loads.
This article has been archived and is no longer updated by Apple.

Symptom

The Server Schedule in Network Assistant 4.0.1 is configured to open Disk First Aid and rebuild the Desktop file of network clients at a scheduled time. If the clients are turned off and miss the scheduled time, a bus error occurs when the computers are restarted and the Network Assistant system extension loads.

Solution

Download and install the Apple Network Assistant Updater 4.0.2. The North American English version of this update is available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Published Date: Feb 20, 2012

Mac OS X Server: Maximum RAM Supported

This article discusses the maximum amount of RAM that can be used with Mac OS X Server.

This article has been archived and is no longer updated by Apple.
The maximum amount of RAM that Mac OS X Server can use varies depending on the version of Mac OS X Server.

Mac OS X Server

- Mac OS X Server 1.0 can work with up to 1 GB RAM.
- Mac OS X Server 1.2 can work with up to 1.5 GB RAM.
- Mac OS X Server 10.0.x can work with up to 3 GB RAM.

Notes:

1. Some computers may have RAM limits below those of Mac OS X Server. For example, you can install only 1 GB of RAM in a Power Macintosh G3 (Blue and White) computer. Although Mac OS X Server 1.2 can work with up to 1.5 GB of RAM, you obviously cannot install that much in this computer.

2. To allow MacOS.app to function correctly with Mac OS X Server and 1 GB or more of RAM, type the following at the command line prompt in a Terminal window:

```
defaults write MacOS SysZoneMemorySize 0x10000000
```

Published Date: Feb 20, 2012

Mac OS 9: Third-Party Scripting Additions May Affect Startup

Third-party items added to the Scripting Additions folder may cause the computer to stop responding during startup.
This article has been archived and is no longer updated by Apple.

Symptom

During startup, the computer stops responding ("freezes"). An "unimplemented trap" error message may also appear.

Solution

1. Start up the computer with extensions disabled. (Hold down the Shift key while turning on the computer until the message "Extensions Off" appears.)

2. Open the Scripting Additions folder, which is in the System Folder.

3. Temporarily remove non-Apple items (place them on the desktop or in a folder outside of the System Folder). Leave these items in the Scripting Additions folder:

- Desktop Printer Manager
- Dialects folder (Mac OS 9.1 only)
- FileSharing Commands
- Keyboard Addition
- Keychain Scripting
- MonitorDepth
- Network Setup Scripting
- Remote Access Commands
- Sound Scripting (Mac OS 9.1 only)
- Speech Listener (Mac OS 9.1 only)
- Standard Additions
- URL Access Scripting

4. Restart the computer.

5. Third-party items that were removed from the Scripting Additions folder should be added back to the folder a few at a time (followed by a restart), to isolate the issue further. Contact the developer of any items which, when in the Scripting Additions folder, cause this issue.

Published Date: Feb 20, 2012

Macintosh Manager: End of File Database Issue

This article discusses a possible issue between Macintosh Manager Server/Multiple User Login Databases and the Epson Launcher extension.

This article has been archived and is no longer updated by Apple.

Symptom

The Macintosh Manager Server/Multiple User Login Databases can potentially be damaged when the Epson Launcher extension is installed and active on client computers.

Common error messages

- End Of File (EOF) error message appears when Macintosh Manager admin is opened
- Macintosh Manager Server cannot be accessed at this time (unknown problem)

To determine whether databases have become unusable, check the file size of "...DB.idx" files. The minimum file size (in bytes) is 4608 bytes. If the file is smaller than 4608 bytes, then it is most likely unusable.

Solution

1. Check client computers using Macintosh Manager or Multiple Users login to determine if the Epson Launcher extension is installed.
2. If installed, disable this extension on all Macintosh Manager clients.

The result of this appears to be some loss of background printing functionality, but the database issue does not seem to resurface.

In order to recover an unusable database follow the instructions in article 88023: "**Macintosh Manager: Recovering an Unusable Database**"

Apple is working with Epson to determine the best course of action toward final resolution on this matter.

Published Date: Feb 20, 2012

Power Mac G4 (Gigabit Ethernet): Does Not Turn on When Power Button Pressed

The Power Mac G4 (Gigabit Ethernet) computer does not turn on when you press its power button.
This article has been archived and is no longer updated by Apple.

Symptom

A limited number of Power Mac G4 (Ethernet Gigabit) computers do not turn on when you press their power button.

Solution

1. Make sure that the power cord is firmly plugged into the computer and the wall socket.

2. Try another wall socket to make sure power is getting to the computer.

3. Open the computer's door and make sure the ribbon cable to the front panel board is connected securely. The front panel board is located behind the power button. (See Figure 1.)

Figure 1 Front panel board cable

4. Also, make sure the front panel board ribbon cable is connected securely to the logic board. (See Figure 2.)

Figure 2 Front panel board ribbon cable

5. If the computer does not turn on after following steps 1 through 4, contact an Apple Authorized Service Provider.

Mac OS 9: Web Browser Unable to Download Unless FTP Passive Mode is Enabled

When attempting to download a file from the Internet, the download process does not seem to begin, and the Web browser may display a "Setting Passive Mode" status message.

This article has been archived and is no longer updated by Apple.

Symptom

When attempting to download a file from the Internet, the download process does not seem to begin, and the Web browser may display a "Setting Passive Mode" status message.

Solution

1. Open the Internet control panel.
2. Click the Advanced tab.

Note: If you do not see an Advanced tab, choose User Mode from the Edit menu and click Advanced, then OK.

3. Click the File Transfer icon to select it.
4. Click the "Use FTP Passive Mode (PASV)" checkbox to enable that option.

Figure 1 Internet control panel with "Use FTP Passive Mode (PASV)" enabled

5. Close the Internet control panel.

AppleScript: Saved AppleScripts Open With No Text in Script Editor

This article discusses an issue where an AppleScript cannot be edited after it is saved and reopened.

This article has been archived and is no longer updated by Apple.

Symptom

When an AppleScript file is opened in Script Editor, there is no text visible to edit.

Solution

If you downloaded the AppleScript 1.4.3 "Z" (English-International) version between 2000-05 and 2000-07, it is likely that you downloaded a damaged file.

The Software Update mechanism automatically downloads the version corresponding to your operating system. If you have an English-International version of Mac OS 9 and used the Software Update control panel to update to AppleScript 1.4.3, you would have received the damaged software.

A corrected version of AppleScript 1.4.3 English-International has been posted. It is available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Note: Scripts created with the damaged version cannot be recovered; it is as if they have been saved as "run only."

Published Date: Feb 20, 2012

Mac OS 9: Installing or Removing Individual Components

This article explains how to custom install or custom remove individual Mac OS 9 components.

This article has been archived and is no longer updated by Apple.
To custom install or custom remove individual Mac OS 9 components follow the steps below.

1. Start up from an installation disc, either one that came with your computer, or a Mac OS 9 CD that you purchased. (You start up from the disc by inserting it into the drive, choosing Restart from the Special menu, and holding down the "C" key as the computer starts up.)
2. Open the disc by double-clicking its icon, if it is not already open.
3. Open the Mac OS 9 folder.
4. Double-click the "Mac OS Install" icon. The Welcome screen is displayed.
5. Click Continue. The Select Destination screen is displayed.
6. Choose the Destination Disk from the pop-up menu.
7. Click Select. The Important Information screen is displayed.
8. Click Continue. The Software License Agreement screen is displayed.
9. Click Continue.
10. Click Agree. (You must agree to the terms of the agreement before you can continue.) The Install Software screen is displayed.
11. Click Customize. The Custom Installation and Removal screen is displayed.
12. Choose items to install or remove.
    - Under Software Components, select one or more of the software components, to be installed or removed, by clicking to check the box to the left of each item..
    - Under Installation Mode, there are three options for most of the software components. The options are Recommended Installation, Customized Installation and Customized Removal. Select one of the three options.
13. Click Start.
14. After the installation or removal is complete, restart your computer.

AppleScript: Alert Displayed When Printing Scripts From Script Editor

An alert box with an error message may appear if you print AppleScript text from the Script Editor application program.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this error message appears after you print AppleScript text from the Script Editor application program:

> "Could not print the document because of a program error."

Although the error message says the document could not be printed, it actually is printed.

Solution

You can safely ignore this error message.

The alert box is displayed as a result of changes made to the printing code in CarbonLib 1.1. CarbonLib 1.1 or later may have been installed as part of another software package. To verify, check the version of the CarbonLib system extension in the Extensions folder.

This may be addressed in a future update to AppleScript.
Published Date: Feb 20, 2012

Apple Hardware Test 1.1: Power Mac G4 Read Me

This article comprises the Power Mac G4 Read Me for Apple Hardware Test 1.1.

This article has been archived and is no longer updated by Apple.

About Apple Hardware Test

Apple Hardware Test is a diagnostic tool for detecting problems with your computer's internal hardware components such as the logic board, memory, modem, video RAM, and Apple's AirPort card. It does not check externally connected hardware components such as USB drives or Firewire devices; it does not check non-Apple devices such as PCI cards from other vendors.

Before using Apple Hardware Test, disconnect external devices (excluding Apple keyboard, mouse, display, and speakers), and remove any non-Apple cards that were not included in Apple's shipping configuration of your system.

Apple Hardware Test does not check your computer for problems with the Operating System (OS) or other software related problems such as application or extension conflicts.

To use the Apple Hardware Test CD, restart your computer while holding down the C key until the "Loading..." icon appears, then you may release the C key. Loading will take approximately 45 seconds. Apple Hardware Test's main screen will appear. Follow the on-screen instructions and recommendations.

Apple Hardware Test for Power Mac version 1.1 is distributed only with the Power Mac G4, and will not work with any other computer.

If you suspect your computer has a hardware problem, the information provided by Apple Hardware Test can help identify the problem. If Apple Hardware Test detects a problem, an error code will be displayed. Please make a note of the error code before pursuing support options. If no hardware failure is detected, the problem may be software related.

Known issues

Apple Hardware Test cannot be used when a mouse is directly connected to the USB port on the display or on the Power Mac G4. Please connect the mouse to a USB keyboard.

The Apple Hardware Test CD will not be ejected on a Power Mac G4 when the Restart/Shutdown button in Apple Hardware Test us clicked. Either manually eject the CD, or use Mac OS to eject the CD.

It may take significantly more time than indicated (on the Apple Hardware Test screen) to run the Extended Test on a Power Mac G4 with more than 512 MB of RAM installed; durations between 18 and 20 minutes have been observed.

AppleCare Recommendations

Apple Hardware Test is one of several tools and procedures you can use when your Macintosh is having trouble. Here are some steps you can follow to help resolve problems. Please back up your data before performing any of these steps.

1. Turn the computer off and on.
You can often eliminate problems by selecting the "Shut Down" option from the Special menu to fully shut down the CPU, then restarting your system.

2. Check cables, peripherals, and user controls.
Shut down your computer. Then disconnect and reconnect all cables. Disconnect all peripherals (such as printers, scanners, cameras and external mass storage devices) to see if they are causing conflicts with your system. Adjust user controls on your monitors and other peripherals to see if this helps.

3. Turn off system extensions.
Restart your system while holding down the Shift key until the following message appears: "Extensions disabled." Then release the key. This turns off system extensions that often cause conflicts. If this solves your problem, use the Extensions Manager to turn off extensions that may be causing the problem.

4. Rebuild the desktop.
Restart your system while holding down the Option and Command keys. Click OK when asked if you want to rebuild the desktop.

5. Start up from the system CD that shipped with your computer.
Start your system from the system CD by holding down the C key until you see the smiling Mac face. If the system works properly when started (booted) from the system CD, you can generally assume that the problem relates to the software which is installed on your computer.

6. Start up from the Apple Hardware Test CD, and run the Quick and Extended Tests.
If the system does not work properly when started (booted) from a known-good system CD (Step 5), you can generally assume that the problem relates to your computer's hardware components. The Apple Hardware Test CD can often be used to start up your computer even if it will not boot into the Mac OS. If Apple Hardware Test passes both the Quick Test and the Extended Test, the problem may be software related. If Apple

Hardware Test detects a problem, make a note of the error code and contact Apple (Step 9).

7. Refer to Mac OS Help Center and the Internet for assistance.
The Mac OS help system under the Help menu in the Finder includes a wealth of technical information. Apple's Knowledge Base, and other resources for technical help and support are available 24 hours a day at www.apple.com/support.

8. Re-install Mac OS.
In many cases, a clean installation of the Mac OS will fix recurring problems. Back up any data before reinstalling. Please follow the instructions in your user manual or on your Restore CD to reinstall the Mac OS.

9. Contact Apple Service and Support for assistance.
If these steps don't help resolve the problem, please review the service and support material that accompanied your computer for information on how to contact AppleCare for further assistance. Apple reserves the right to change telephone hours at any time.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Mac OS: "Finder Could Not Start" Error Message

Your computer does not finish starting up and you see an alert box with an error message that says the "Finder could not start because 'DragLib-SetDragImage' could not be loaded."
This article has been archived and is no longer updated by Apple.

Symptom

The computer does not finish starting up. You see an alert box with an error message that says:

> "Finder could not start because 'DragLib-SetDragImage' could not be loaded."

Solution

Using the Software Restore or Software Install CD-ROM disc

1. Find the Software Restore or Software Install disc that came with your computer (or another disc that can be used as a startup disk).
2. Turn the computer on (or click Restart if the alert box is still on the screen).
3. Insert the disc.
4. Press the C key on the keyboard to start up the computer from the disc.
5. Open the computer's hard disk.
6. Open the System Folder.
7. Open the Extensions folder.
8. Find these files (one or both may be present):
   - Macintosh Drag and Drop
   - DragLib
9. Drag these files to the Trash.
10. Open the Startup Disk control panel.
11. Click the icon of your computer's hard disk.
12. Close the Startup Disk control panel.
13. Choose Restart from the Special menu.

OR

Disable extensions during startup

1. Turn the computer on (or click Restart if the alert box is still on the screen).
2. Press on hold the shift key.
This disables extensions and control panels.
3. Open the computer's hard disk.
4. Open the System Folder.
5. Open the Extensions folder.
6. Find these files (one or both may be present):
   - Macintosh Drag and Drop
   - DragLib

7. Drag these files to the Trash.

8. Choose Restart from the Special menu.

Some earlier software installers may install these extensions, which result in this error. Mac OS 9.1 ignores these extensions if they are installed, and does not produce this alert box and error message.

Power Mac G4 Cube: Troubleshooting: Video: No Video on Monitor With Apple Display Connector

This article describes a possible solution when a monitor with an Apple Display Connector (ADC) connected to a Power Mac G4 Cube computer displays no video, but a monitor with a VGA-style connector does.

This article has been archived and is no longer updated by Apple.

Symptom

A monitor with an Apple Display Connector displays no video when connected to a Power Mac G4 Cube computer. However, if you connect a monitor with a VGA-style connector video appears on the display.

Solution

This article covers repair procedures for Apple Authorized Service Providers on selected Apple products, but the procedures are being published in the Knowledge Base for the general public for educational purposes only. At this time, there are a limited number of repairs that a customer can perform and these are covered under the Customer-Installable Parts program. For information on this program please visit http://www.info.apple.com/installparts/ .

If you have not been authorized to perform these procedures, please contact Apple (800-APL-CARE in the U.S.) or your local Apple Authorized Service Provider to schedule a repair.

Follow these steps:

1. Connect a known-good monitor with an Apple Display Connector (ADC).
2. Verify the monitor with an ADC has a known-good power source.
3. Make sure the display cable from the monitor is securely connected to the video card.
4. Make sure the video riser card and the video card are properly seated in their connectors.
5. Verify the cable connector at J3 on the video riser card is pushed in all the way. This connector provides the voltage for the ADC.

Figure 1 Cable connector at J3

6. If the monitor with an ADC still displays no video, contact Apple Support for further assistance.

iTunes: MP3 Smart Encoding Adjustments

This article explains the function of the MP3 Smart Encoding Adjustments option in iTunes.
This article has been archived and is no longer updated by Apple.
If you choose to customize the MP3 encoding configuration, you can enable the Smart Encoding Adjustments option to allow iTunes to automatically adjust some of the internal parameters to improve the sound quality of converted files based on the original bit rate selection. This can include reducing the number of channels, encoded frequencies, or the sample rates.

Depending on the bit rate settings you select, you will hear different levels of quality in the music playback. Lower bit rate settings produce smaller file sizes but lower quality music playback. Higher bit rate settings create larger files but sound quality nearly as good as the source material.

iTunes does not override your choices if you've selected a specific sample rate or number of channels, even if the Smart Encoding Adjustments option is enabled. To allow iTunes to adjust your configuration, choose Auto from the Sample Rate pop-up menu, and click Auto in the Channels area.

Mac OS: Adobe Morisawa New CID Font Issue

This article discusses a possible issue with Adobe's Morisawa New CID Fonts.

This article has been archived and is no longer updated by Apple.

Symptom

The Adobe Morisawa New CID Fonts listed below may not print as expected from Mac OS 8.5, Mac OS 8.6, or Mac OS 9.x. Instead of the print job using the outline font downloaded to the printer, a less elegant looking, jagged bitmap of the font may print.

Beginning with Mac OS 8.5, the LaserWriter driver asks the Open Font Architecture (OFA) for the name of the Font to use in the print job; unfortunately, these Fonts have multiple names and the print job may be built using the wrong one. Thereafter, when the print job is processed by the printer, the font won't be found in the printer and a bitmap of the font will print instead.

Solution

Try one of the following solutions.

- Prior to printing, choose Page Setup from the File menu, choose PostScript Options from the pop-up menu and click "Unlimited Downloadable Fonts" to enable that option.
- Save the file as a PDF, then drag this file to the icon of the Desktop printer.
- In the Print dialog box, choose Save As File from the pop-up menu, then choose All But Standard 13 from the Font Inclusion pop-up menu. Print to a PostScript file, then drag this file to the icon of the Desktop printer.
- Download, install and use Adobe's PostScript driver AdobePS when printing these fonts.
- Obtain and install Adobe's ATM Font when printing these fonts.

Apple DVD Player: Last Region Change Must Use Single Region Disc

The DVD drive will not play DVD-Video discs of the region you just switched to. Instead, you see an alert box with this error message: "This DVD-Video disc has a region code that does not match the region code set for your DVD drive. You cannot change the region code for your DVD drive."

This article has been archived and is no longer updated by Apple.

Symptom

The DVD drive will not play DVD-Video discs of the region you just switched to. Instead, you see an alert box with this error message:

> "This DVD-Video disc has a region code that does not match the region code set for your DVD drive. You cannot change the region code for your DVD drive."

Solution

1. Restart the computer.

2. Insert a single-region DVD-Video disc. Make sure the disc's region is the one you want to use to permanently set the DVD drive's region. For example, if you want the drive to play Region 2 discs, you should insert a disc that is only Region 2. **Important:** You will no longer be able to switch regions.

DVD-Video playback is normally restricted to one of six geographic regions. DVD-Video discs can usually only be played with a DVD player whose region matches the disc's. Apple's DVD solutions allow you to set or change your DVD drive's region setting up to five times. The last setting is permanently locked into the drive. When changing the region setting for the last time, you must use a DVD-Video disc approved for play in one region only.

For more information about DVD region encoding, see article 60183: "**Apple DVD Player: DVD-Video Region Discussion**"

Published Date: Feb 20, 2012

Apple System Profiler: Creating, saving, and printing reports

This article has been archived and is no longer updated by Apple.
Learn how to create, print or save an Apple System Profiler report in Mac OS 9 or earlier. For Mac OS X information, see this article.

Creating, printing or saving an Apple System Profiler (ASP) report

1. Make sure a printer is selected in the Chooser (see Selecting a printer below).
2. Choose Apple System Profiler from the Apple menu.
3. Choose New Report from the File menu.
4. In the dialog box that appears, select the items you want in your report and click OK.
5. Choose Print One Copy or Save from the File menu.

Selecting a printer

1. Choose Chooser from the Apple menu.
2. Serial or USB printer
   - In the Chooser, select the type of printer you want to use.
   - Click the port the printer is connected to.
   - Close the Chooser by clicking the Close box.
3. Network printer
   - In the Chooser, select the type of printer you want to use.
   - Click the name of the printer you want to use.
   - Close the Chooser by clicking the Close box.

Drag and drop

Most information displayed in the ASP window can be moved to the desktop or to other applications by using drag and drop. This provides a quick way to export specific portions of the ASP information.

- Move the mouse pointer over the information you want to export.
- Drag the information to the desktop or application.
- A text clipping file of this information is created on the desktop, or the text will appear in the application.

Apple DVD Player: Opening DVD Content on Other Media

This article explains how to open DVD content located on other media such as a hard disk using Mac OS 9 and Apple DVD Player 2.3 or later.

This article has been archived and is no longer updated by Apple.

Normally, Apple DVD Player will play DVD content only from a DVD-Video disc. However, Apple DVD Player 2.3 and later can play DVD-formatted content from another source.

To enable playback from other sources:

1. Choose Preferences from the Edit menu.
2. Click the Advanced Controls tab.
3. Click the "Add 'Open VIDEO_TS' menu item to File Menu" checkbox to enable that option.

Figure 1 DVD Player prefs window

You can now (when playback is stopped) select a DVD-formatted VIDEO_TS directory using the Open command in the File menu.

Figure 2 Open VIDEO_TS menu window

Do not open the VIDEO_TS folder, but use this command to choose a VIDEO_TS folder that contains files that are in the DVD standard layout and format.

Figure 3 Select a VIDEO_TS folder window

Note: You cannot play DVD content from a server volume.

After you've selected a source folder, the player will ignore any DVD-Video discs on the desktop. To play from a disc, click Eject, or use the Open command to select the VIDEO_TS folder on the disc you want to play.

See technical document 42647 "**DVD Player 3.1: How to View DVD Content on Other Media**" for information on DVD Player 3.1 and Mac OS X

Apple Pro Speakers: No sound from speakers

This document describes what to do if no sound comes from one or both Apple Pro Speakers connected to some Power Mac G4 computers.

This article has been archived and is no longer updated by Apple.

Symptom

There is no sound from one or both of the Apple Pro Speakers.

Solution

Follow these steps:

1. Push on the Apple Pro Speaker jack to make sure it is firmly inserted into the Apple Speaker sound output port
   - The Apple Pro Speaker jack has two detents. You should feel them as you push the jack into the sound output port. Giving the Pro Speaker's connector a slight twist while inserting it into the sound output port may make a better connection.
2. Verify the speaker volume and balance are set appropriately in the Sound control panel. Check to see if sound has returned.
3. Reset the Parameter RAM (PRAM) by following these steps:
   - Shut down the computer.
   - Locate the following keys on your keyboard: Command, Option, P, and R. You must hold these keys down simultaneously in this step.
   - Press the computer's power button and then simultaneously hold down the Command-Option-P-R keys. You must press these keys before the gray screen appears.
   - Continue to press the keys until the computer restarts twice, then release the keys.
   - The parameter RAM and the non-volatile RAM in your computer are reset to the default values. The clock setting is not changed.
4. If the computer emits normal startup sounds from the speakers, yet there is no sound present once Mac OS has started up, reinstall the system software from the Mac OS "Install" disc that came with your computer.

If the symptom persists after following these steps, call Apple for assistance in replacing the speakers.

For more information, see "Macintosh: How to Reset PRAM and NVRAM".

Mac OS 9: Disc Burner - Drive Space Requirements

Your computer's hard disk must have at least twice the capacity of a CD-R or CD-RW disc in free space in order for Disc Burner to burn a disc.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears when you try to burn a disc:

> "The disc could not be burned because the startup disk is full."

Solution

Before you insert a blank CD-R or CD-RW disc, make sure that your computer's startup disk has at least twice the capacity of the disc available as free space. For example, if you are using a 650 MB CD-R disc you should make sure that your hard disk has at least 1.3 GB of available space.

Mac OS 9.1: No Sound From Internal Modem When Network Setup Extension Is Disabled

With the Network Setup Extension disabled, the internal modem may not generate any sound.

This article has been archived and is no longer updated by Apple.

Symptom

With the Network Setup Extension disabled, the internal modem does not generate any sound.

Solution

Use the Extensions Manager to make sure the Network Setup Extension is installed and turned on.

If the extension is not installed, install Mac OS 9.1 Update, or, if you have the full Mac OS 9.1 Install CD, custom install Open Transport from the CD. Open Transport is located in the Network & Connectivity archive.

Mac OS 9.1: Connection Issue With Some USB Modems

After updating to Mac OS 9.1, some types of USB modems will not respond properly when attempting to connect to an ISP.
This article has been archived and is no longer updated by Apple.

Symptom

After updating to Mac OS 9.1, some types of USB modems do not respond properly when attempting to connect to an ISP. With Mac OS 9.0.4 installed, the modem can connect to the Internet service provider (ISP) without any difficulty.

Solution

The standard USB modem driver included in Mac OS 9.1 is based on the USB Communications Device Class (CDC) specifications. Early USB modems that are not compliant with the CDC specifications may no longer behave as expected.

If you have difficulties with your USB modem after updating to Mac OS 9.1, contact the modem manufacturer to ask about an update.

Note: You may be able to restore functionality to your third-party USB modem by reinstalling Mac OS 9.0.4. For information on how to perform a clean installation of Mac OS 9.0.4, see article 60496: "**Mac OS 9: Performing a Clean Installation**."

iMac (Early 2001): Software Installers Report the Disk Is Locked

In some cases, you may not be able to install software on an iMac (Early 2001) computer because an alert box appears with a message that says the disk is locked.

This article has been archived and is no longer updated by Apple.

Symptom

When installing software an alert box appears with a message that the software could not be installed because the disk is locked.

Solution

- If you started up the computer with a CD-ROM disc, try restarting the computer from the hard disk and then installing the software.
- The hard disk's directory structure may need to be repaired. Open Disk First Aid and verify or repair the disk before installing any software. To obtain the latest version of Disk First Aid, use the Software Update control panel or check Apple Software Updates (http://www.apple.com/swupdates/).
- If Disk First Aid cannot repair the hard disk or the Disk is Locked error persists, you may try a third-party drive repair utility.

Note: Before attempting any disk repairs, you should back up your data. Apple does not recommend nor support the use of third party drive repair utilities. Check with the vendor of the repair utility before using it for any specific recommendations.

For related information on Disk First Aid and Mac OS volumes, refer to the following articles:
Article 7565: "**Disk First Aid: Purpose**"
Article 13628: "**Disk First Aid: What to Do When it Finds an Error**"

Apple Location Manager: Frequently Asked Questions (2 of 3)

This article contains frequently asked questions (FAQ) regarding Apple Location Manager, with answers to those questions. Additional Apple Location Manager FAQ articles are listed at the bottom of this article.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. How do you turn the Location Manager on and off?
2. Can I create a Location and then save it as a file, export it?
3. Can I create a Location on a different computer and then import it to mine?
4. I have exported a Location and dropped it into my Locations folder located in the Location Manager Prefs folder. Why do I get an error message that Location Manager is not installed correctly?
5. Will At Ease's "Protect System Folder" option prevent Location Manager from switching Locations?
6. My "Home" and "Office" Locations will be similar, can I duplicate "Home" and then modify it to make the "Office" Location?
7. I have created my "Home" Location while I was at home, and then also created my "Office" location at home, but the "Office" Location is not working correctly?
8. I want to change the name of one of my Location, I do not see a Rename button?
9. I no longer use a Location I created. Can I delete this Location so it will no longer be a selection?
10. I am editing one of my Locations, and I notice that some of the Modules have a (bullet) in front of them?
11. When I change to my Location that I named "Office", it reports switching to "Ethernet" in the "Switching to Location" alert box, but when I go to the AppleTalk control panel it is set to Modem/Printer port?
12. When I switch to one of my Locations, an alert box appears that reports "Can't switch between Open Transport and Classic Network. Use the 'Network Software Selector' utility."
13. What other messages can appear in the "Switching to Location" alert box?
14. Can I edit multiple Locations at the same time?
15. How can I tell if a Module was written by Apple's or a third party?
16. I have installed a new Module in the "Location Manager Modules" folder located in the Extensions Folder in the System Folder but the new Module is not showing up in the Location Manager?

Question 1: How do you turn the Location Manager on and off?

Answer: You turn the Apple Location Manager program on by choosing a Location and you turn the program off by specifying no Location, "None (Off)", in the pop-up menu.

Question 2: Can I create a Location and then save it as a file, export it?

Answer: You may Export a Location for use with another computer. In the Location Manager in the Location Editing List, select the Location you want to export. Then go to the File menu and select Export Location. It will ask you where to save and what you wish to name the file in the Save As Dialog. See question 3 for more information.

Question 3: Can I create a Location on a different computer and import to mine?

Answer: You may Import a Location from another computer. First Export the Location on the other computer, see question 18 above, and copy the exported file to the computer you wish to perform the import. Then in the Location Manager go to the File menu and select Import Location. It will bring up the Open Dialog box. Select the Location you wish to import. If you already have a Location named the same as the Location you are trying to import it will give you the option of Canceling, Replace, or allow you to Rename it to something different.

- Importing a location from another computer does not guarantee that all the software required to use the location is installed. (Apple Location Manager does not install software.) For example, you may import a location that specifies "LaserWriter 300" as the default printer, but the location cannot switch to that printer unless you have the printer's driver software installed. Therefore, it's a good idea to check all the settings in a location you import to verify that they are available on the new computer.
- If you import any location that includes settings for a LaserWriter as the default printer, you must reselect and set up the printer in the Chooser. (Otherwise the location you imported will use the "generic" printer information for your LaserWriter instead of the specific information for the model identified in the original location.) You select and set up a LaserWriter by opening the Chooser, selecting the LaserWriter icon, selecting the printer's name, clicking the Setup button, and clicking Auto Setup. When the printer's model name appears, click OK.
- **Note:** your computer must be connected to the network the printer is on to update the LaserWriter correctly.

Question 4: I have exported a Location and dropped it into my Locations folder located in the Location Manager Prefs folder. Why do I get an error message that Location Manager is not installed correctly?

Answer: This is not the correct way to import a Location into the Location Manager. Please see Question 3 above for the correct way to import a Location.

Question 5: Will At Ease's "Protect System Folder" option prevent Location Manager from switching Locations?

Answer: If you are using At Ease on your computer and you establish Locations for Apple Location Manager, you may see an error message when a module for Location Manager interacts with part of the system software to which access has been restricted by At Ease. You may need to turn off the "Protect System Folder" option so that Location Manager operates correctly.

Question 6: My "Home" and "Office" Locations will be similar, can I duplicate "Home" and then modify it to make the "Office" Location?

Answer: You may Duplicate a Location in the Location Manager in the Location Editing List, select the Location you want to duplicate and then click the Duplicate button.

Question 7: I have created my "Home" Location while I was at home, and then also created my "Office" location at home, but the "Office" Location is not working correctly?

Answer: It is best to make the Location configuration while you are out that location. This way you can set all the different aspects of the Modules you will be adding to this Location, such as the printer you will be using, and then create the Location with these settings being active and working.

Question 8: I want to change the name of one of my Location, I do not see a Rename button?

Answer: To rename a Location, open the Location, and then change the name in the "Location Name" field and then close the Location window. It will ask if you want to save changes, click Save.

Question 9: I no longer use a Location I created. Can I delete this Location so it will no longer be a selection?

Answer: You may Delete a Location in the Location Manager in the Location Editing List, select the Location you want to delete and then click the Delete button.

Question 10: I am editing one of my Locations, and I notice that some of the Modules have a (bullet) in front of them?

Answer: While creating or editing a Location you may notice that a Module has a (bullet) in front of it, this means that the system values for this setting have changed since it was added to the Location you are currently editing. To save the new values, select the Module and then click the "Update" button.

Question 11: When I change to my Location that I named "Office", it reports switching to "Ethernet" in the "Switching to Location" alert box, but when I go to the AppleTalk control panel it is set to Modem/Printer port?

Answer: This applies to all Modules that change a control panel to a Configuration the user created. This includes AppleTalk, TCP/IP and Extensions Manager.

When you change to a Location it will change to the Configuration that you saved with this Location. If you named the Configuration in the AppleTalk control panel "Ethernet" it will report in the "Switching to Location" alert box that it has switched to "Ethernet" when you change the Location. This does not mean this Configuration is changing the AppleTalk control panel to Ethernet, but to the Configuration you named as "Ethernet". This Configuration named "Ethernet" could no longer be set to Ethernet but instead Modem/Printer port. You may have changed this Configuration to Modem/Printer port, or more likely you went into the AppleTalk control panel to change the setting and it asked you to Save and you selected "Save" instead of "Don't Save", thus changed the Configuration "Ethernet" to Modem/Printer port.

Note: To eliminate confusion it is best to name your Configurations the same name as the Location you will be using them with. Name the Configuration you will be using with the "Office" Location as "Office" in the AppleTalk, TCP/IP, and Extensions Manager control panel.

Question 12: When I switch to one of my Locations, an alert box appears that reports "Can't switch between Open Transport and Classic Network. Use the 'Network Software Selector' utility."

Answer: Check your Extensions Manager and make sure that the AppleTalk and TCP/IP control panel are not turned off, if so turn them on and restart. The Network Module is trying to change your Configuration but can not access one of these control panels. Make sure you can open and access both control panels, they may be damaged. The Location Manager requires that the software you wish to change with a Module be loaded properly to work correctly.

Question 13: What other messages can appear in the "Switching to Location" alert box?

Answer: Here are a few of the messages you may get:

- "No settings were changed" - This means that the current setting for this Module was the same as it was previously set.
- "The Auto-Open module cannot open the selected item during startup, It will be opened after the startup process is complete" or"The setting will take effect after startup is complete."- If you switch locations as the computer is starting up, Apple Location Manager may defer changing some settings, such as sound level or auto-opening a document, until the computer's startup procedure is complete. Usually you will see a message reporting that the switch to the new settings is being deferred.
- "Restart Needed" - If the computer has already loaded extensions you will need to restart in order for the new extension configuration to take effect, otherwise the new extensions configuration will load as the computer continues to boot.
- "New settings are available immediately" - The new settings for this module have been changed and have already taken effect.

- "Module Auto-Open Item" is not installed. Setting skipped since the module wasn't found. - The Module, is this example Auto-Open Item, is not located in the Location Manager Modules in the Extensions Folder in the System Folder. You will need to reinstall the Module and then restart the computer in order for the Module to be loaded properly. If you switch locations during startup and then switch again before continuing with the startup process, the deferred settings will only occur for the last location chosen. If there were deferred settings in the first location, they will be skipped.

Question 14: Can I edit multiple Locations at the same time?

Answer: Yes you can edit multiple Locations at the same time. You can have, as an example, your "Home" Location and your "Office" Location windows open side by side. You can even copy the settings you have added from one Location and paste them into another, if this is desired.

Select the Setting you wish to copy in the right hand list of the open Location window, example Time Zone in the "Settings for this Location" list for "Office". Then select copy from the Edit menu, click on the other Location, say "Home", to make it active and select the "Settings for this Location" list and then select paste from the Edit menu. It will not paste a setting that has already been added to this Location, in this example "Home".

Question 15: How can I tell if a Module was written by Apple's or a third party?

Answer: When you are editing a Location click on the Module in question and then hit the Get Info button in the center of the window. All Apple Computer's Modules will have on the first line of the Get Info window the name of the Module followed by Apple Computer. Example: Auto-Open Item Apple Computer.

Question 16: I have installed a new Module in the "Location Manager Modules" folder located in the Extensions Folder in the System Folder but the new Module is not showing up in the Location Manager?

Answer: Try restarting the computer. If you perform a Get Info on one of the Location Manager's Modules the kind is "system extension. "Most Modules require that you restart the computer for them to show up in the Location Manager and to work properly.

Other Apple Location Manager FAQ's can be found in the following articles:

Apple Location Manager: Frequently Asked Questions (3 of 3)

This article contains frequently asked questions (FAQ) regarding Apple Location Manager, with answers to those questions. Additional Apple Location Manager FAQ articles are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. I am using the Apple Guide for the Location Manager, the Location Manager Apple Guide tells me that the software you need, the Apple Location Manager control panel, is not installed.
2. Do I need the Location Manager INIT enabled. I like to run a lean extensions folder and want to disable all the extensions that I can?
3. I have selected in the Location Manager's Preferences to have the Location Manager Always ask me which Location to make active on startup, but it is not bringing up the dialog box?
4. Does the Location Manager use AppleScript to do it's magic?
5. The question mark for the Location Manager's Apple Guide in the upper right hand corner of the Location Manager window is dimmed, or if I click on it nothing happens?
6. I click the question mark to bring up the Location Manager's Apple Guide but it comes up to a blank Apple Guide button with the world Mobility entered but no headings or topics?
7. My Location Manager control strip has a red X going through it?
8. Will there be other Modules I can use with the Location Manager?
9. Can the Location Manager mount servers when I change Locations?
10. If I set the Chooser to open the server at startup, switch to a Location that turns off AppleTalk, and restart, an alert box states: "An AppleShare system error occurred. (Please run the Chooser to activate AppleTalk)."
11. What if there is no Module written to do what I need it to do?
12. Is the Location Manager scriptable?
13. Can I have the Location Manager change to a certain Location every time the computer starts up?
14. Why doesn't the current version (version 1.0) of the Networking Module support changing the PPP control panel configurations which is part of OT/PPP?
15. What are the software components of Location Manager?
16. When I "auto open" a certain control panel, and I click OK in the "Changes Made" window, Apple Script Editor opens, displaying a script. What is causing this?

Question 1: I am using the Apple Guide for the Location Manager, the Location Manager Apple Guide tells me that the software you need, the Apple Location Manager control panel, is not installed.

Answer: You have moved the Location Manager Control Panel out of the Control Panel folder inside the System Folder, or you have disabled the Location Manager with the Extensions Manager. Either move it back and restart or reactivate it in the Extensions Manager and restart to fix this.

Question 2: Do I need the Location Manager INIT enabled. I like to run a lean extensions folder and want to disable all the extensions that I can?

Answer: Yes you must have the Location Manager INIT enable to be able to use the Location Manager.

Question 3: I have selected in the Location Manager's Preferences to have the Location Manager Always ask me which Location to make active on startup, but it is not bringing up the dialog box?

Answer: You may have disabled the Location Manager INIT with the Extensions Manager. Make sure this extensions is active and installed in the Extensions Folder in the System Folder.

Question 4: Does the Location Manager use AppleScript to do it's magic?

Answer: No, you do not have to have AppleScript enabled in order to use the basic functions of the Location Manager. If you choose to have an AppleScript application be an Auto-Open Item then you will need to have AppleScript enabled. Also if you wish to use the Location Manager's Apple Guide then you will need to make sure AppleScript is enabled.

Question 5: The question mark for the Location Manager's Apple Guide in the upper right hand corner of the Location Manager window is dimmed, or if I click on it nothing happens?

Answer: Make sure the Apple Guide and AppleScript extensions are enabled in the Extensions Manager.

Question 6: I click the question mark to bring up the Location Manager's Apple Guide but it comes up to a blank Apple Guide button with the world Mobility entered but no headings or topics?

Answer: Make sure the file "Apple Location Mgr GA" is in the Extensions Folder inside the System Folder.

Question 7: My Location Manager control strip has a red X going through it?

Answer: You may have disabled the Location Manager INIT with the Extensions Manager. Make sure this extensions is active and in the Extensions Folder in the System Folder.

Question 8: Will there be other Modules I can use with the Location Manager?

Answer: In addition to the Modules that ship with the Location Manager software, Apple is also working with third-party developers to create additional Modules. Please refer to the Apple PowerBook web site http://www.powerbook.apple.com for information on additional Modules as they become available.

Question 9: Can the Location Manager mount servers when I change Locations?

Answer: Yes. Mount the server as normal, and then create an alias to it. Then in the Location add the Auto-Open Item Module and have it open this alias.

Question 10: If I set the Chooser to open the server at startup, switch to a Location that turns off AppleTalk, and restart, an alert box states: "An AppleShare system error occurred. (Please run the Chooser to activate AppleTalk)."

Answer: This is because the current Location does not have AppleTalk active. It is best use the Auto-Open Item Module to open an alias of the server as suggested in Question 39, that way only when you are at the location that needs this server will it try to mount.

Question 11: What if there is no Module written to do what I need it to do?

Answer: Remember that one of the Modules is Auto-Open Item. If what you need to do can be accomplished by using AppleScript, you can create an AppleScript application and then use the Auto-Open Item Module to open it up when you switch Locations.

Note: Apple Technical Support provides 90 day complimentary up and running support for AppleScript (installation, compatibility), but does not assist with creating or debugging scripts. Other resources for those wanted to get started with AppleScript include:

- AppleScript Software Development Tool Kit available through the Apple Developer's Catalog
- Several excellent books, available at your local bookstore
- On-line Discussion groups (applescript-users@solutions.apple.com)
- Web resources, such as the Apple Support page (search AppleScript) and http://www.latenightsw.com/scripting.html

Question 12: Is the Location Manager scriptable?

Answer: Yes, it is scriptable but not recordable. It supports the Required Suite (open, print, quit, run) and defines a Class called Location. Which can be used to get the Current Location selected, and to change the Current Location.

Note: Apple Technical Support provides 90 day complimentary up and running support for AppleScript (installation, compatibility), but does not assist with creating or debugging scripts. Other resources for those wanted to get started with AppleScript include:

- AppleScript Software Development Tool Kit available through the Apple Developer's Catalog
- Several excellent books, available at your local bookstore
- On-line Discussion groups (applescript-users@solutions.apple.com)
- Web resources, such as the Apple Support page (search AppleScript) and http://www.latenightsw.com/scripting.html

Question 13: Can I have the Location Manager change to a certain Location every time the computer starts up?

Answer: Apple Location Manager only changes system settings when you tell it to; it does not automatically change settings at startup (although you can use Preferences in the Edit menu to have the program prompt you to change settings). If you want Apple Location Manager to switch to a specific location each time the computer starts up, you can create an AppleScript script that performs that task. Put the script in the Startup Items folder and the location you want will be set at startup. Open the location you want to use at startup, then create the script below. Using the Script Editor application, type the following lines (The following example is from the "Apple Location Manager Read Me" file):

```
tell application "Finder"

    open file ((control panels folder as string) & "Location Manager")

    tell application "Location Manager"

        set current location to location "snd"

    end tell

end tell
```

Copy the script above exactly and substitute the name of your location for "snd"; for instance, type "Sample" if you want the Sample location to be used each time you start up. When finished typing the script, launch "Location Manager" then compile the script.

Note: Apple Technical Support provides 90 day complimentary up and running support for AppleScript (installation, compatibility), but does not assist with creating or debugging scripts. Other resources for those wanted to get started with AppleScript include:

- AppleScript Software Development Tool Kit available through the Apple Developer's Catalog
- Several excellent books, available at your local bookstore
- On-line Discussion groups (applescript-users@solutions.apple.com)
- Web resources, such as the Apple Support page (search AppleScript) and http://www.latenightsw.com/scripting.html

Question 14: Why doesn't the current version (version 1.0) of the Networking Module support changing the PPP control panel configurations which is part of OT/PPP?

Answer: This would only be needed if you have multiple PPP configuration you would like to change with different Locations. Most users probably only have one Internet Service Provider (ISP). The Networking Module is capable of changing the TCP/IP control panel from say Ethernet to PPP. So this is all that would be needed. If you have multiple ISP, or use different phone numbers (different Configurations) depending on which Location you are at, you could add an Auto-Open Item with a Location to open the PPP control panel so then you would only have to change the configuration manually in the PPP control panel.

Question 15: What are the software components of Location Manager?

Answer: The Location Manager consist of the following software components:

- Apple Location Manager Read Me", a text file, located on the hard drive window.
- Location Manager", an application, located in the Control Panels folder.
- Location Manager INIT", an extension, located in the Extensions Folder.
- Apple Location Mgr GA", an Apple Guide document, located in the Extensions Folder in the System Folder.
- Location Manager CSM", a control strip module, located in the Control Strip Modules Folder in the System Folder.
- Location Manager Modules", a folder, located in the Extensions Folder in the System Folder. This contains the Modules that the
- Location Manager can use. After installation of Version 1.0 it contains:
  - Auto-Open Item
  - Default Printer
  - Extensions Mgr
  - File Sharing
  - Network
  - Sound
  - TimeZone
- Location Manager Prefs", a folder, located in the Preference folder inside the System Folder that contains two items:
  - Location Manager 1.0 Prefs", a file.
- Locations", a folder, this contains the created Locations. After installation of version 1.0 will contain one item:
  - Sample"

Question 16: When I "auto open" a certain control panel, and I click OK in the "Changes Made" window, Apple Script Editor opens, displaying a script. What is causing this?

Answer: A corrupted preference is causing the script to open. Trash the Location Manager preferences folder, restart, and set up Location Manager again. You will find that AppleScript will not open in this fashion again.

Other Apple Location Manager FAQ's can be found in the following articles:

AppleWorks 6 Update: Mac OS 9.1 and Mac OS X Installation

This article describes how AppleWorks 6 is installed in Mac OS 9.1 and Mac OS X 10.0 when updating from AppleWorks 6.x to AppleWorks 6.2
This article has been archived and is no longer updated by Apple.
The AppleWorks 6.2 Updater replaces your AppleWorks 6.x application with an application package that contains both AppleWorks 6.2 for Mac OS X 10.0, and AppleWorks 6.1.2 for Mac OS 8.1 through Mac OS 9.x.

An application package is not a single executable file, but a package of files that includes one or more executable binaries. In this case, the package contains two binaries, one for Mac OS 9.1, and one for Mac OS X 10.0.

Mac OS 9.1 Installation

When you start up a computer with Mac OS 9.1, and double-click on the AppleWorks 6.app file, AppleWorks 6.1 for Mac OS 9.1 opens.

Mac OS X Installation

When you start up a computer with Mac OS X 10.0, and double-click on the AppleWorks 6 file, the AppleWorks 6.2 for Mac OS X 10.0 opens.

Note: The ".app" extension is not visible in Mac OS X 10.0. The filename will appear as "AppleWorks 6" when in Mac OS X 10.0, and as "AppleWorks 6.app" when in Mac OS 9.1.

Macintosh Manager 1.4: Explanation of the AFP File Server Usage Graph

This article explains the AFP File Server Usage graph in the Server Tab of Macintosh Manager Admin.
This article has been archived and is no longer updated by Apple.
In Macintosh Manager Admin, under the Server Tab, there is a graph that represents AFP File Server Usage of the Macintosh Management Authentication Server. The purple areas represent the actual server utilization for that time and the black line represents the average usage during that time. (See Figure 1)

Figure 1 AFP File Server Usage graph

The black line is usually most important when reading this graph to determine the sustained server load. It's possible (for example) to have a peak for a second or two and the purple will hit 100 percent but the black line might show the average usage to be around 20 percent. If the black line consistently runs high (above 80 percent), you should think about splitting up your Documents Storage between multiple servers or upgrading your current Macintosh Management Server to a faster server.

For information on saving files between multiple servers, see article 31265: "**Macintosh Manager 1.3: Saving Workgroup Documents to Another Volume**."

QuickTime: Not All Keys Enable Pro Features

Not all QuickTime Pro keys will enable the pro features of QuickTime 5. This article explains which keys will and will not enable pro features.

This article has been archived and is no longer updated by Apple.

Not all QuickTime Pro keys will enable the pro features of QuickTime 5.

- QuickTime 3 Pro keys do not enable QuickTime 5 Pro features.
- QuickTime 4 Pro keys purchased before 2000-10-12 **do not** enable QuickTime 5 Pro features.
- QuickTime 4 Pro keys purchased on or after 2000-10-12 enable QuickTime 5 Pro features.
- QuickTime 5 Pro keys purchased after 2000-10-12 enable QuickTime 5 Pro features.

If you purchased a QuickTime Pro key before the above date, you **must** purchase a new key to enable QuickTime 5 Pro features. New keys may be purchased from The Apple Store (http://www.apple.com/store/) .

QuickTime 6 Pro
QuickTime 6 replaces earlier versions of QuickTime. A QuickTime 6 Pro key is required to unlock Pro features of QuickTime 6. If you wish to use a QuickTime 4 or 5 Pro key, you need to use an earlier version of QuickTime, which you can download from the Apple Support Web site (http://www.info.apple.com/usen/QuickTime/).

Mac OS: Apple CD Audio Player and CD Control Installation

This article explains where to find and how to install AppleCD Audio Player and the CD control strip.

This article has been archived and is no longer updated by Apple.

Symptom

The Apple CD Audio player and the CD control strip are not installed on the computer.

Solution

Apple installs iTunes as the audio player of choice for listening to CDs. iTunes lets you create your own personal digital music library, allowing you to manage and play your collection of high-quality MP3s with drag-and-drop simplicity. With a compatible CD-RW drive, you can even create your own custom audio CDs for use in your car or home stereo system. Check out the iTunes Web site at http://www.apple.com/itunes/ .

However, if you want to use either AppleCD Audio Player or the CD control strip, the software is located on the Software Install CD. The following steps explain how to install the software.

1. Insert the Software Install CD.
2. Double-click the CD icon.
3. Double-click the CD Extras Folder.
4. Double-click the AppleCD Audio Player folder.
5. Drag copy the AppleCD Audio Player application onto the hard disk. (Place this application where it is convenient.)
6. Drag the CDStrip module on top of the closed System Folder. The files will be auto-routed to the correct folder within the System Folder. (Avoid lingering over the System Folder while drag coping or Mac OS spring loaded folder feature may open the folder.)
7. Restart the computer to activate the CD control strip.

You will now be able to use the AppleCD Audio Player and the CD control strip to listen to audio CDs.

Macintosh Manager: FireWire Drives and Multiple Users Interaction

This article describes how different Macintosh Manager and Multiple Users users interact with removable media privileges and a FireWire hard drive connected to the same client computer.
This article has been archived and is no longer updated by Apple.

Symptom

A user who does not have "removable media" privileges logs in to a computer that has a FireWire hard drive connected to it and then logs out. A user with "removable media" privileges logs in, but the FireWire hard disk icon does not appear on the desktop. The only solution to re-enable access to the FireWire hard drive is to restart the computer.

To avoid a this symptom, a Macintosh Manager administrator or system owner must grant the "removable media" privilege to any users and their workgroup that could potentially log into a computer that has a FireWire hard drive connected to it.

These symptoms could potentially arise in either Macintosh Manager or Multiple Users if there is a mix of Removable Media privileges amongst workgroups (Macintosh Manager) or users (Multiple Users) logging into the same client computer.

Note: RAM disks are also considered a form of removable media. For details about RAM disk interaction the Macintosh Manager and Multiple Users environment, please see article number 31339: **Macintosh Manager: RAM Disks and Multiple Users Interaction** .

Solution

Macintosh Manager

1. Use the Macintosh Manager application to enable Read/Write access for Removable Media (Except CDs).
2. In the Macintosh Manager application, this setting can be set for each Restricted Finder and Panels workgroup and is located:
Workgroups tab -> <select workgroup> -> Privileges tab
3. In the Privileges section of the Privileges tab, choose Read & Write from the Removable Media (Except CDs) pop-up menu.

Multiple Users

1. Use the Multiple Users control panel to enable Read/Write access for other removable media.
2. In the Multiple Users control panel, this setting must be set for each Limited and Panels user and is located:
<select user> -> Click Open -> Edit "<user name>" window ->Privileges tab
3. In the "Allow access to" section of the Privileges tab, select "Other removable media"
4. Close the Edit "<user name>" window.

Published Date: Feb 20, 2012

Macintosh Manager: Disk Quota Behavior Described

This article describes Macintosh Manager disk quota.
This article has been archived and is no longer updated by Apple.

Symptom

Macintosh Manager enforces Soft Disk Quotas rather than Hard Disk Quotas.

Definitions

Soft Disk Quotas: User accounts have a fixed amount of disk space in their documents folder, which can be used for any purpose. Macintosh Manager enforces Soft Quotas by allowing the user to exceed the defined disk quota in order to save a single file. However, users are subsequently prevented from saving additional files because the quota has been exceeded.

Hard Disk Quota: This feature prevents users from exceeding their defined quotas before they can try to save a file. This is not a feature of Macintosh Manager.

Solution

Macintosh Manager administrators should periodically check user folder size to determine if quotas have been exceeded in order to prevent server volumes from becoming too full. This can be easily accomplished manually or by using Sherlock, AppleScript, or a third-party file utility.

Note: Enabling Macintosh Manager's disk quota feature and setting the value to 0 (zero) does not enforce a disk quota. Use a value of 1 or higher to enforce a disk quota.

Published Date: Feb 20, 2012

Macintosh Manager: RAM Disks and Multiple Users Interaction

This article discusses RAM disk usage in the Macintosh Manager or Multiple User environments. RAM disks are considered removable media while using the Macintosh Manager or Multiple User environments
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS 9.x

RAM disks disappear from the desktop when a user logs out of the Macintosh Manager and Multiple User environments.

Mac OS 8.6 and earlier

An alert box appears with this message, and you have to restart the computer:

> "You do not have access privileges to use removable media volumes."

Solution

If the Macintosh Manager administrator wishes to grant access to RAM disks on client computers, the following settings should be enabled.

1. In the Macintosh Manager Admin Utility, enable "Read/Write access to Removable Media (except CDs)" under the Workgroups Tab:Privileges Tab:Privileges box:Removable Media (except CDs)

2. In Multiple Users, each user must be granted access to removable media separately. This setting is located in the Details section of each user account under the Privileges Tab: Other Removable Media.

3. In order to avoid the above symptoms an administrator must grant the Removable Media privilege to all workgroups (Macintosh Manager) or users (Multiple Users) who could potentially log in to a client using a RAM disk.

Note: Each client computer maintains the contents of the RAM disk locally, not the Macintosh Manager server. All users will have Read/Write access to the RAM disk if they are granted access to removable media. RAM disk contents are lost in the event of a loss of power or other improper shutdown of the computer.

DVD Studio Pro: CMF and DDP Formats Overview

This article describes CMF and DDP formats as used when exporting a project to DLT tape.
This article has been archived and is no longer updated by Apple.
When building and formatting a project for DLT tape using DVD Studio Pro, there is an option to export as DDP or CMF.

DDP 2.0 (Disc Description Protocol)

DDP is an earlier format that was used by DVD replication facilities. Before CMF (Cutting Master Format) became a standard, a DVD-R disc could be used for testing a DVD-Video movie project, but could not be used as the master image. When DDP was the standard, you still had to write your project to DLT tape. DDP has been replaced by the Cutting Master Format, and you can supply either a DVD-R or a DLT tape as your master image.

CMF (Cutting Master Format)

CMF is the more common format for DLT tapes. DDP is an option in DVD Studio Pro because some replication facilities may require DDP format.

DVD Studio Pro: Audio/Video Sync Drifts During Preview

When previewing a long project in DVD Studio Pro, in some instances the audio and video may be out-of-sync.
This article has been archived and is no longer updated by Apple.

Symptom

When previewing a long project in DVD Studio Pro, in some instances the audio and video may be out-of-sync unless the following steps are taken.

The preview is generated from three different decoders (audio, video and navigation) without a common time base. This occurs with especially long tracks or when SKIP actions using markers are involved. This only affects the preview mode.

Solution

For a more accurate preview, multiplex your project and preview it in Apple DVD Player.

1. In DVD Studio Pro, choose Build Project from the File menu, then select the destination for the built project.

2. In Apple DVD Player, make sure the option "Add 'Open VIDEO_TS' menu item to File Menu" is selected. This is under the Advanced Controls tab in Apple DVD Player preferences.

3. In Apple DVD Player, choose Open VIDEO_TS from the File menu, locate the VIDEO_TS folder you created, and preview the project.

Power Mac G4 (Digital Audio): 40 GB and 60 GB Hard Drive Issue

This article discusses an issue with the 40 GB and 60 GB Quantum hard drives used in Power Macintosh G4 (Digital Audio) computers. It explains how to determine if your computer is affected and what steps you should take if it is.
This article has been archived and is no longer updated by Apple.

Symptom

Apple has become aware of an issue with 40 GB and 60 GB Quantum hard drives used in Power Mac G4 (Digital Audio) computers. A limited number of these drives have been found to damage files, cause data loss, and potentially prevent the computer from starting up. Only a small number of the computers built with these hard drives are affected. You can find out if your computer is affected by determining if its serial number falls within a certain range of numbers outlined below.

Solution

Identify the computer

Follow these steps to identify affected computers.

1. Check your computer's serial number. (It is located on the rear of the computer just below the power sockets).
2. Determine if the serial number begins with the characters "XA115". The complete serial number will have an additional six characters, and the whole format would look like this: " XA115XXXXXX", where the x can be any letter or number.

If the serial number begins with "XA115" then continue with the next step. If it does not begin with "XA115" then your computer's hard drive is not affected by this issue.

Identify the drive

Use Apple System Profiler to identify the model number and serial number of your computer's Quantum hard drive.

1. Open the Apple System Profiler application from the Apple menu.
2. Click the Devices and Volumes tab.
3. In the Devices and Volumes window, click the disclosure triangle next to Hard Drive and to the right of the Internal ATA 1 line.

A small box will open containing information about your computer's hard drive. If the vendor name is Quantum and the Product ID number is FIREBALLP AS40.0, for the 40 GB drive, or FIREBALLP AS60.0, for the 60 GB drive, this drive should be replaced. If another vendor's name and Product ID number appears, there is no need to replace the drive.

Please contact Apple to order a replacement drive or contact your local Apple Authorized Service Provider to have the drive replaced. This repair will be covered under the computer's limited warranty.

Notes

1. This issue only affects computers purchased in Canada and the United States.

Network Assistant 4: Computer Won‘t Restart

When you try to restart a Network Assistant 4 client, the computer stops responding. A blank screen appears, as if the computer were restarting, but the power light (LED) remains on.

This article has been archived and is no longer updated by Apple.

Symptom

When you try to restart a Network Assistant 4 client, the computer stops responding. A blank screen appears, as if the computer were restarting, but the power light (LED) remains on.

Solution

Deselect the Voice Verification option in the Multiple Users control panel.

Note: Macintosh Manager clients must be logged out, or a dialog box will appear on the screen preventing the computer from restarting.

Mac OS: Flashing Globe When Computer Turns On

If the Network Disk icon is selected in the Startup Disk control panel, and the computer is not connected to a NetBoot server, the computer will take significantly longer to start up.

This article has been archived and is no longer updated by Apple.

Symptom

The following startup sequence is observed:

1. The computer begins to start up.
2. A flashing or blinking globe appears on the screen. (This can last several minutes.)
3. A folder that has an alternating flashing question mark and the Mac OS logo inside appears on the screen. (This can last several minutes.)
4. The computer starts up normally.

Solution

This is happening because Network Disk is selected in the Startup Disk control panel and no NetBoot servers are available.

To resolve this issue, follow these steps:

1. Open the Startup Disk control panel.
2. Select the appropriate startup disk icon.
3. Close the Startup Disk control panel.
4. Restart the computer.

PCMCIA for PowerBook: Frequently Asked Questions (2 of 2)

This article contains frequently asked questions (FAQ) regarding the PowerBook PCMCIA Expansion Module for the PowerBook 500 series, and the built-in PCMCIA (PC card) bay used in many other PowerBook computers, with answers to these questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. I inserted a modem card into my PowerBook, but nothing happened. What's wrong?
2. When I set up my fax software, it worked fine. Now, it never dials.
3. I'm getting the message that the modem card can't be ejected from my PowerBook because it's in use, but it's not in use.
4. The PCMCIA modem acts differently than an external modem rated at the same speed with the same software. Why is this?
5. I'm trying to eject a storage card, but my computer tells me I can't because the card is in use. But its not in use! There are absolutely no files or programs open.
6. Can I copy documents onto a storage card so that someone using a DOS-compatible laptop with a PCMCIA slot can read them after inserting the card?
7. What does PCMCIA stand for?
8. I inserted a hard drive into my PowerBook, and it has trouble ejecting.
9. I get poor and erratic results using a cellular phone with my PCMCIA modem.
10. I'm using a mass storage card with a Macintosh and a PC. Each computer shows a different set of files and folders, and claims to have the entire hard drive.
11. Dragging the icon to the trash (or using the other software controls) to eject a card sometimes does not work. I get a message that the card was not ejected successfully. But sometimes this same card does eject just fine.
12. Some cards are ejected all the way out and slide across my desk. Can the card be damaged if it falls off the desk?
13. Sometimes I get poor throughput or failed file transfers when I'm using a high-speed modem connection. Sometimes it works fine. Why?
14. Where else can I go for answers about my PowerBook?
15. Where can I get the latest Apple software updates for my PowerBook?

Question 1: I inserted a modem card into my PowerBook, but nothing happened. What's wrong?

Answer: In first release of the PCMCIA Expansion Module, modem cards don't appear on the desktop. If the PCMCIA Quick Eject control strip module is visible, then its appearance will reflect that either the upper or lower slot (or both) contains cards. If the control strip isn't visible (or isn't installed) then there will be no visible change when a modem card is inserted. However, the insertion of a modem is sensed by the software, and the modem is added to the list of devices available in the CTB (Communications Toolbox).

Programs which support the CTB (including MicroPhone, ARA) will display either upper card slot or lower card slot (or both, if you've inserted two PCMCIA modems) when you have the program open and are looking at the Connection dialog. The name and location of this setup command will vary from program to program. There's a popup menu in which you specify which port contains the modem you wish to use. With a PCMCIA modem, the names of the ports will always be either upper card slot or lower card slot. These ports only show up in the list while a modem is inserted in a slot.

This is different from the traditional printer and modem ports, which always appear, regardless of whether you have an external modem plugged into them. In the case of the PowerBook 500, 5300, 1400,and 190 series, which has only one physical serial port, it's called Printer-Modem Port.

With the PowerBook 5300, 1400 and 190 series, a PC Card's icon should always appear on the desktop if it is being recognized. If the icon does not appear, check to make sure all of the appropriate software is installed.

Question 2: When I set up my fax software, it worked fine. Now, it never dials.

Answer: Sometimes software doesn't successfully store the identity of the port to which your modem is connected. The software may have fallen back to its default of the Printer-Modem port. Or, you might have inserted the modem into a different slot than you used last time. Check the connection settings of your software; for the port, select either upper card slot or lower card slot as appropriate.

Question 3: I'm getting the message that the modem card can't be ejected from my PowerBook because it's in use, but it's not in use.

Answer: Some software, such as fax modem software, will put the modem into auto-answer mode. The modem may have to be considered busy while the modem listens for an incoming call. This can happen with a background process or a system extension, in which case there doesn't have to be an open application. Launch your software and check the setup controls to see if auto-answer is on. For example, if there's a control for Answer on <3> rings, you might have to temporarily turn the modem software off or set it to Answer on <never> to free up and then eject the modem. Refer to the users guide which came with your modem software for more information.

Question 4: The PCMCIA modem acts differently than an external modem rated at the same speed with the same software. Why is this?

Answer: Modems differ in their use of the Hayes command set. The PCMCIA Expansion Module and PowerBook 5300/1400 allow you to plug in a modem, but operating the modem and setting up your software to use the modem and connect to other services is not within the control of the PCMCIA hardware and software. You need to consult the user guide and/or the tech support service of your modem manufacturer and your modem software publisher to determine the correct AT commands.

To determine whether or not the modem is being made available (which is all that Apple's software is responsible for), get into the setup connection dialog. Its exact name and location varies from program to program. The method or tool (again, terms vary) should usually be Serial Tool. In some cases, Apple Modem Tool will also work.

When Serial Tool is selected, a window containing choices for port should appear. This window might have a horizontal scroll bar. The window will likely contain icons named, for example, modem/printer and upper card slot. If either upper card slot or lower card slot appears, then the PowerBook is working correctly (If the window also contains internal modem, then you have a built-in internal modem. This is not the same as your PCMCIA modem.) You should click the upper card slot (or lower card slot) icon to select the PCMCIA modem.

Further modem configuration, such as speed, handshaking, setup strings, AT commands, and so on, are the responsibility of the user, and the modem and software provider. Those settings should not be affected by whether the user has a modem plugged into the PCMCIA slot or an external modem plugged into the back of the computer. The PCMCIA Expansion Module and the 5300/1400 makes the modem available, but it does not control it.

Question 5: I'm trying to eject a storage card, but the computer tells me I can't because the card is in use. But its not in use! There are absolutely no files or programs open.

Answer: This is common when people start using any type of removable media, such as Syquest drives or PCMCIA cards. If File Sharing is on, then any drive which was in the computer when it started up can not be dismounted. Temporarily turn off File Sharing by using either the Control Strip module which looks like a folder or the Control Panel named Sharing Setup. After removing the card, you can turn File Sharing back on.

Question 6: Can I copy documents onto a storage card with my PowerBook so that someone using a DOS-compatible laptop with a PCMCIA slot can read them after inserting the card?

Answer: If you initialize a PCMCIA storage card on your Macintosh, it will be a Macintosh formatted volume, and a DOS-compatible laptop will probably not be able to recognize it unless her computer has software meant to translate Macintosh disks.

However, if you're using PC Exchange 2.0.2 or later, then a PCMCIA card formatted on a DOS machine should be readable. PC Exchange version 1.x handles DOS floppies only (not hard disks or removable devices like PCMCIA).

Question 7: What does PCMCIA stand for?

Answer: It stands for Personal Computer Memory Card International Association.

Question 8: I inserted a hard drive into my PowerBook, and it has trouble ejecting.

Answer: Some drives use a case that's not perfectly rectangular. The unusual shape can cause issues during ejection. If any card can not be ejected, even when you insert a paper clip into the proper hole, the card will need to be removed by an Apple Authorized Service Provider.

Note: The following unsupported workaround allows use of these types of cards: Insert a type I or Type II card (such as a modem or ATA flash card) into the top slot. Using a pair of needle nose pliers, pull the card out of the top slot. (If it was a storage card, and its icon had appeared on the desktop, drag the icon to the trash.) Physically pulling the card out of the slot without using any of the software ejection controls will leave the springs and levers in the top slot cocked back out of the way. The drive can then be inserted, used, and ejected normally. When you're done using the drive, insert a card into the top slot (as you do so you will not feel any resistance, because the springs are already cocked back). Then use the control panel or control strip to remove the card. It will auto-eject, and the springs will return to their normal position.

Question 9: I get poor and erratic results using a cellular phone with my PCMCIA modem.

Answer: Cellular modem connections can suffer from a variety of issues:

Signal Strength
Even though the phone itself indicates a strong signal, and voice calls are fine, data connections may be unreliable. If possible, try moving to a different area, preferably away from buildings and towards a known cell site.

Connection Speed
Connecting at 4800 bps or 7200 bps is often more successful than either 2400 or 9600 bps. If you add the AT command %B4800 or %B7200 to the modem initialization string of your communications program, your modem will only try to connect at that speed. It won't negotiate a speed with the other modem. This can significantly improve connections.

Sensitivity To Temporary Carrier Loss
Cellular connections undergo temporary interruptions much more often than traditional land-based phone lines. For example, when your connection is handed off from one cell to another (which can occur even when you are not moving), it's not uncommon for the carrier signal to disappear for an instant and then be reconnected. This happens automatically, usually without your noticing.

Modems use the S10 register to determine how long to wait before permanently hanging up the connection when a loss of carrier is detected. The duration of carrier loss which a modem will withstand before giving up the host varies from modem to modem, but many of the modems you're likely to connect to (such as those at online services) are likely to have a very short duration specified in the S10 register.\\

Even if your cellular modem's S10 register has been set (via a connection script or options file) to be tolerant of long periods of carrier loss, if the remote modem to which you're connecting to has a small value in the S10 register, your connection may fail often. If possible, ask the person in control of the other modem to set a larger value in the S10 register. Most modems allow a value from 1 to 255 (measured in tenths of a second). The default is often 14 tenths. Increasing this value to, say, 100 or more tenths.

Question 10: I'm using a mass storage card with a Macintosh and a PC. Each computer shows a different set of files and folders, and claims to have the entire hard drive.

Answer: This can happen if you take a Macintosh-formatted card, then initialize it on certain PC configurations, and then bring it back to the Macintosh for use under PC Exchange.

The Mac files and folders should all be gone, (because of the PC initialization) but they're still visible. During the initialization on the PC, the part of the disk which contained the Macintosh directory information wasn't deleted as it should have been. The drive is now in a dangerous and vulnerable state! Some of the files may still be opened (on each respective machine), but there are no guarantees, and the drive will certainly become corrupted if you continue to put more files on it.

If you have a drive in this state, you should immediately copy the files to a different location, such as the computer's internal hard disk. Do this both on the Macintosh and the PC. You may receive error messages, and some of the files may not be copied successfully, because each computer thinks it has full ownership of the same areas of the disk.

So far, this behavior has been seen only when the PC initialization is done with the IBM driver on a ThinkPad. The driver which comes with Ventura Micro software does not have this issue. Other versions of C&SS (Card & Socket Services) running on the ThinkPad are still under investigation.

If you reinitialize the drive in the Macintosh (using the Erase Disk command in the Special menu), it will no longer be recognizable to the PC, and you will be able to use it again safely if you use it only in the Macintosh.

Cards which are formatted on the PC (and never formatted on the Macintosh) can be used successfully going back and forth. The issue only occurs when a Macintosh-format card is re-formatted on a PC.

Question 11: Dragging the icon to the trash (or using the other software controls) to eject a card sometimes does not work. I get a message that the card was not ejected successfully. But sometimes this same card does eject just fine. Why?

Answer: Occasionally a card may not seat itself fully and cock the springs back quite all the way, so that the springs cannot push the card out when you request an ejection. Try pushing first on one corner of the card, making sure its firmly seated, then try the ejection again. If that does not work, push the other corner of the card and try the ejection.

If the card still does not auto-eject, you'll have to manually eject the card by inserting a bent paper clip into the hole next to the card. Notice that the upper and lower slots each have their own ejection hole.

Question 12: Some cards are ejected all the way out and slide across my desk. Can the card be damaged if it falls off the desk?

Answer: The amount of force necessary to disconnect the card from the internal connector and push it out varies widely from card to card. Type III hard drives are much heavier than Type I ATA flash cards, for example. For that reason its inevitable that some cards may come out far enough to leave the computer completely. PCMCIA cards are designed for the unpredictable rigors of portable computer users, and the chance of damaging the card is very low.

Question 13: Sometimes I get poor throughput or failed file transfers when I'm using a high-speed modem connection. Sometimes it works fine. Why?

Answer: If you have LocalTalk active, it can interfere with other high-speed serial activity. Modem connections with DTE or port speeds of 19,200 and above can be particularly sensitive to this issue.

If you're using LocalTalk, consider turning AppleTalk off (using the Chooser) while you're doing modem transfers. Keeping your DTE or port speed the same as your modem connection can help. Using hardware handshaking can also help. Consult the documentation for your modem and communication software for more information about DTE speed and hardware handshaking.

Question 14: Where else can I go for answers about my PowerBook?

Answer: If you haven't done so already, check the other PowerBook FAQ documents. Also, depending on where you found this FAQ, you should have access to Apple's Knowledge Base - located on the Internet at: <http://kbase.info.apple.com/>. This knowledge base is Apple's official tech support database and contains thousands of technical articles which are easily searchable.

Question 15: Where can I get the latest Apple software updates for my PowerBook?

Answer: To find the most recent version of Apple software, consult the Apple Software Updates Library at http://www.apple.com/swupdates .

Other PCMCIA for PowerBook FAQ's can be found in the following article:

Mac OS 9.1: Outlook Express Unexpected Quits After Upgrading from Mac OS 9.0.4

Outlook Express may unexpectedly quit when trying to send an email on a computer with a Spanish or Swedish version of Mac OS 9.1 that has been upgraded from Mac OS 9.0.4.
This article has been archived and is no longer updated by Apple.

Symptom

Outlook Express unexpectedly quits with an error of type 2 when you try to send an email.

Solution

This is caused because duplicate versions of Text Encoding Converters files are installed.

Follow these steps to remove duplicate files from the Text Encodings folder:

Swedish Mac OS 9.1

1. Open the folder called Teckenkonvertering in the Systemmapp.

2. Drag the following Text Encoding files to the Trash.

- Västeuropeisk kodning
- Unicode-kodning
- Turkisk kodning
- Thai-kodning
- Symbol-kodning
- Koreansk kodning
- Japansk kodning
- Indisk kodning
- Hebreisk kodning
- Grekisk kodning
- Kyrillisk kodning
- Kinesisk kodning
- Kinesisk kodning (tillägg)
- Centraleuropeisk kodning
- Arabisk kodning

3. Restart the computer.

Spanish Mac OS 9.1

1. Open the folder called Codificaciones de texto in the Carpeta del Sistema.

2. Drag the following Text Encoding files to the Trash.

- Codificación Arabica
- Codificación Japonesa
- Codificación Centro Europea
- Codificación Coreana
- Codificación China
- Codificación de simbolos
- Adiciones codificaciones chinas
- Codificación Tailandensa
- Codificación Cirillica
- Codificación Turca
- Codificación Griega
- Codificación Unicode
- Codificación Hebrea
- Codificación de Lenguages del Este
- Codificación Indias

3. Restart the computer.

Mac OS: Alert Appears When FireWire Hard Drive Is Disconnected

An alert appears when you disconnect a FireWire hard drive without choosing Put Away or Eject.

This article has been archived and is no longer updated by Apple.

Symptom

An alert appears when you disconnect a FireWire hard drive without choosing Put Awaw or Eject.

Mac OS X 10.0 Message

> "The storage device that you just removed was not properly put away before being removed from this computer. Data on the device may have been damaged or lost. In the future, please put away the device (Choose its icon and Eject it or Drag it to trash) before removing the device."

Mac OS 9 message

> "A FireWire disk has stopped responding. The problem must be corrected to prevent damaging the disk's contents. Please check all FireWire connections. If you added, removed, or turned a FireWire device on or off, try undoing what you did."

Solution

You should always put away a FireWire hard drive's disk icon(s) before disconnecting its cable or power.

Additional information

Mac OS 9
The computer is unusable until you dismiss the alert. Reconnect the FireWire cable to the computer and put away the drive's disk icon(s) by dragging it to the Trash. Or click its icon and choose Put Away from the file menu or Eject from the Special menu. You can also use the keyboard shortcuts by pressing the Command-Y keys or Command-E keys.

Mac OS X 10.0
Simply click OK, and continue working. However, you should reconnect the FireWire cable and put away the drive's hard disk icon(s) by dragging it to the Trash, Or click its icon and choose Eject from the File menu. You can also use the keyboard shortcuts by pressing the Command-E keys.

Final Cut Pro and Final Cut Express: Compatibility With Multiple Users and Macintosh Manager

This article has been archived and is no longer updated by Apple.

Learn compatibility information about Final Cut Pro and Final Cut Express with multiple user configurations.

Multiple Users for Mac OS X

All local users can use Final Cut Pro and Final Cut Express in Mac OS X. Both Admin and non-admin users are supported. **Note**: Final Cut Pro and Final Cut Express should be installed only when logged in as an Admin user.

Macintosh Manager

Final Cut Pro and Final Cut Express do not work with a Macintosh Manager server environment.

NetBoot

Final Cut Pro and Final Cut Express are not supported with NetBoot. See "**Final Cut Pro and Final Cut Express: Not Compatible With NetInfo Login**" for more information

Multiple Users for Mac OS 9

Final Cut Pro 3 can be used in a single-computer multiple users environment using the Multiple Users control panel in Mac OS 9. Follow these steps to configure Multiple Users for Final Cut Pro 3 in Mac OS 9:

1. Install Final Cut Pro as an administrator.
2. Open the application.
3. Enter a name and serial number (provided with Final Cut Pro).
4. Quit the application.
5. Add Final Cut Pro to the User Applications list for each "limited" user in the Multiple Users control panel.

Mac OS: "Can‘t Open Preferences File" Message

When a control panel is opened, an alert box with this message appears: "Can't open the 'control panels name' preferences file."
This article has been archived and is no longer updated by Apple.

Symptom

When a control panel is opened, an alert box with this message appears:

> "Can't open the 'control panels name' preferences file."

Solution

The preferences file can sometimes become unusable, resulting in unpredictable behaviors. This is easily fixed by following these steps:

1. Open the System Folder.
2. Open the Preferences Folder.
3. Drag the preference file in question to the Trash.
4. Choose Empty Trash from the Special menu.
5. Restart the computer. The control panel reverts to its default settings.
6. Open the control panel.
7. Reset the desired preferences to match what they were before.

Tip

You can save a good copy of a preferences file to avoid recreating custom settings if this symptom happens again:

1. Make a duplicate of the preferences file immediately after it is installed and set up for the first time.
2. Put the file in a safe place.

If you have to delete the preferences file again, you can simply replace it with a duplicate of the saved, clean file. This preserves your desired preference settings, and reduces any unwanted behavior that may have been caused by a unusable Preferences file.

Deleting same-name user‘s folder in Mac OS 9.1 affects Mac OS X

After deleting a user's folder (home folder) in Mac OS 9.1, you are unable to use Mac OS X as that user.
This article has been archived and is no longer updated by Apple.

Symptom

After deleting a user's folder (home folder) in Mac OS 9.1, you are unable to use Mac OS X as that user. The Dock may contain several generic folder icons instead of applications; the user's desktop items, user-specific System Preference settings, Documents, Library, Movies, Music, Pictures, Public, Sites folders and contents may be lost.

Solution

The following two scenarios cause this issue:

1. You dragged the user's folder, or the entire Users folder to the Trash and then emptied the Trash.

Solution

Do not manually delete the Users folder or user's individual folder through the Finder. To properly delete a Mac OS X user, use the Users pane in the Mac OS X System Preferences application.

2. You created a user with the same name in the Mac OS 9.1 Multiple Users control panel, and the existing folder was deleted.

Solution

In the Mac OS 9.1 Multiple Users control panel, if a new user is created with the same name as a Mac OS X user, the following message appears:

> "A user folder for '<user name>' already exists. Do you want to keep the existing data, or delete the entire folder?"

Click Keep instead of Delete.

Alternatively, you may wish to use a different user name. If you clicked Delete and the deleted user's folder was the only user created for Mac OS X, you may need to reinstall Mac OS X.

However, if you previously created another (admin) user name, you may log out and log in with that name. You may then recreate the original user name in the Users pane, without reinstalling Mac OS X. However, the user's previous settings and documents will not be restored.

Notes

1. This issue cannot occur within the Classic environment of Mac OS X, nor if Mac OS X and Mac OS 9.1 are installed on different hard disk volumes.

2. You should always avoid deleting Mac OS X user folders while started up from Mac OS 9.1. Use the Mac OS X System Preferences to manage Mac OS X users instead of the Mac OS 9.1 Finder or Multiple Users control panel.

Macintosh: How to Record Sounds Without a Sound Input Port

You can use a third-party microphone to record sounds on computers that do not have a sound input port.

This article has been archived and is no longer updated by Apple.

To record sounds on a computer that does not have a sound input port, you must purchase an external microphone or audio adapter that connects to the computer's Universal Serial Bus (USB) port(s). Click the Macintosh Products Guide link on the Apple USB Web site (http://www.apple.com/usb/) to find a USB microphone or USB audio adapter. Follow the instructions that come with your microphone to record sounds.

These computers do not have a sound input port:

- Power Mac G4 (QuickSilver)
- Power Mac G4 (QuickSilver 2002)
- Power Mac G4 (Digital Audio)
- Power Mac G4 Cube (CD-RW)
- Power Mac G4 Cube
- iBook
- iBook (FireWire)

These computers have a built-in microphone but do not have a sound input port:

- PowerBook G4
- PowerBook G4 (Gigabit Ethernet)
- iBook (Dual USB)
- iMac (Flat Panel)

For additional information, see technical document 58764: "**iMac (Flat Panel), Power Mac G4 (Digital Audio) and (QuickSilver): Sound Output Ports.**"

Note: The listing of these third-party products is for informational purposes only, and constitutes neither an endorsement nor a recommendation of these products.

AppleWorks 6.2 Updater: Installer Will Not Open

With CarbonLib 1.3.1 or later installed and Extensions off, the AppleWorks 6.2 Update installer will not open.

This article has been archived and is no longer updated by Apple.

Symptom

With CarbonLib 1.3.1 or later installed and Extensions off, the AppleWorks 6.2 Update installer will not open. After double-clicking the AppleWorks 6.2 Update installer, an alert box with the following message appears:

Figure 1 AppleWorks 6.2 Update installer alert

Solution

Restart your computer with extensions enabled and open the updater again.

Disc Burner: Filenames on CD-R Discs Truncated on Windows-Compatible Computers

Filenames on CD-R discs are truncated to 11 characters on Windows-compatible computers.

This article has been archived and is no longer updated by Apple.

Symptom

Filenames on CD-R discs made with Disc Burner are truncated to 11 characters (eight characters plus a three character filename extension) on Windows-compatible computers.

If you see this symptom on a Macintosh computer, see technical document 60779: "**Disc Burner 1.0: Standard Disc (HFS Plus/ISO 9660) Appears As ISO 9660 Disc**."

Solution

Download and install Authoring Support 1.1.3 or later from Apple Software Downloads (http://www.apple.com/swupdates/).

MacDNS: Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding MacDNS, with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. I need a "parent" server, why bother running MacDNS at all? Why not just use my ISP's name server?
2. I work for a large company/university with thousands of computers on the Net. Can I use MacDNS as my primary DNS server? Is MacDNS only for small and medium-sized LANs? What are its limits?
3. How should I configure MacTCP (or Open Transport) on the computer running MacDNS?
4. Can you quickly walk me through the process of setting up MacDNS to serve my domain? My domain name is "intercloud.com" and I am going to be running all my services (mail server, Web server, DNS server) on one computer.
5. Is it possible to specify more than one secondary name server for a given domain?
6. My secondary DNS provider wants the serial numbers for my domain data to be in "YYMMDDnn" format. Does MacDNS support this?
7. How do I serve multiple domains with MacDNS? I want to map "www.intercloud.com" and "www.tyrell.org" to my Web server.
8. How do I set up multiple default home pages on my Web server using MacDNS?
9. How do I set up a default MX record for my domain?
10. How do I set up a wildcard PTR entry for a block of addresses?
11. What can I do to speed up performance of MacDNS?
12. Why do I sometimes see incoming requests in the log file with my local domain name tacked on the end? (i.e. "www.apple.com.mydomain.com")
13. How can I add a new hardware/software type for a host? I have a bunch of PCs, but that isn't one of the hardware options.
14. How can I get rid of the dialog box that asks "Are you sure you want to quit MacDNS?"
15. I'm setting up MacDNS to serve an intranet at my office. Our network isn't connected to the Internet. Should I just make up arbitrary IP addresses for the hosts in my domain?

Question 1: I need a "parent" server, why bother running MacDNS at all? Why not just use my ISP's name server?

Answer: One clear advantage of running MacDNS is that it reduces the amount of outward-bound network traffic on your local-area network (LAN). Lookups for a given host name can be serviced very quickly from MacDNS's cache. Another advantage is that you have control of your domains, instead of your ISP having control. For example, you can add or remove hosts instantly, instead of waiting for a service provider to accomodate your request.

Question 2: I work for a large company/university with thousands of computers on the Net. Can I use MacDNS as my primary DNS server? Is MacDNS only for small and medium-sized LANs? What are its limits?

Answer: The number of hosts that MacDNS can support is limited only by the amount of memory available to the application.

While it is possible to serve an organization of any size with MacDNS, it is not currently possible to delegate subdomains to another name server. This means that you need to include all hosts from all the subdomains of your domain in the local database. For example, if you serve "domain.com," you would need to include "host1.subdomain.domain.com." and so forth. This requirement might be a nuisance for large sites that have many sub- domains in different locations. In such a situation, you may want to use a centralized, UNIX-based DNS server for the top-level domain, and MacDNS servers for individual subdomains.

Question 3: How should I configure MacTCP (or Open Transport) on the computer running MacDNS?

Answer: In general, you always want to enter the IP address of the computer that is running MacDNS in the "Domain Name Server Information" area of the MacTCP control panel. You can specify your computer's own IP address as the DNS server to use. This allows other services that may be running concurrently (such as WebSTAR or AIMS) to take advantage of MacDNS's caching, rather than generating outbound network requests.

If you are running Open Transport networking software, enter the IP address of the computer running MacDNS in the "Name server addr" area of the TCP/IP control panel.

Important: Do not specify your own IP address as a parent server in the MacDNS "Set Parent Servers..." dialog box! If you do, it's possible for requests to loop endlessly without being answered, because MacDNS will be forwarding lookups back to itself. (Note: this applies only to MacDNS 1.0. Later versions prevent this situation from occurring.)

Question 4: Can you quickly walk me through the process of setting up MacDNS to serve my domain? My domain name is "intercloud.com" and I am going to be running all my services (mail server, Web server, DNS server) on one computer.

Answer: Here's a checklist of steps to follow (and pitfalls to avoid), using "intercloud.com" as an example. Consult the MacDNS Administrator's Guide for additional information.

1. If you are connected to the Internet (as opposed to an isolated "intranet"), then you need to specify a parent server. Choose "Set Parent Servers..." from the Hosts menu, then type the name and IP address of at least one other DNS server. Usually this will be your ISP's name server, or a DNS server you were using previously.

2. Create a new zone file. The Zone Information dialog box appears.

1. Type your domain name (intercloud.com) in the Domain Name field.

2. Type the host name that you plan to give to your MacDNS computer in the Primary Server field (for example: ns.intercloud.com). The name you enter here must be the computer's canonical or "real" name, not an alias. If you have a secondary name server for your domain, type its name in the Secondary Server field. (See below if you have more than one secondary name server.)

3. Type the administrator's e-mail address in the Administrator field (for example: hostmaster@intercloud.com). Don't forget to add an account for this user on your mail server.

3. Create the required host entries for your domain.

Primary server entry:

Choose "Add Permanent Host" from the Hosts menu. Type the name of your primary server (ns.intercloud.com) in the Host Name field, and enter its IP address in the field below that. Since this computer is also going to act as a mail server and a web server, you will probably want to set up some additional names for this host. For example, type www.intercloud.com, mail.intercloud.com in the Aliases field to create two appropriate alias names for ns.intercloud.com. (See below if you need to create a name outside of the intercloud.com domain that points to this host.)

Domain name entry (with mail exchanger):

Your zone should include a separate host entry for the domain name itself (unless you specified intercloud.com as an alias of ns.intercloud.com in the previous step.) Since you don't have a "real" host named intercloud.com, choose "Add MX-Only Host" to create a new host entry for that name. Type 10 ns.intercloud.com in the Mail Exchangers field. This entry lets other mail servers know that ns.intercloud.com handles mail for the domain intercloud.com with a preference value of 10. Note that you can't specify 10 mail.intercloud.com here, because only the canonical name of a mail server can be used for MX mappings.

4. Save your zone file by choosing "Save As..." from the File menu. That's it!

Question 5: Is it possible to specify more than one secondary name server for a given domain?

Answer: Only one secondary name server can be entered in the Zone Information dialog, but MacDNS does support multiple secondary NS records. To specify more than one secondary name server, you'll need to edit the zone file manually with a text editor. Look for the line that says:

; Nameserver entries

After this line, you'll notice the secondary name server (NS) entry. If you need more secondary servers, just add additional lines. For example:

- mydomain.com. NS secondary.provider.net.
- mydomain.com. NS another.provider.net.
- mydomain.com. NS third.provider.net.
- mydomain.com. NS fourth.provider.net.

Question 6: My secondary DNS provider wants the serial numbers for my domain data to be in "YYMMDDnn" format. Does MacDNS support this?

Answer: MacDNS starts the serial number at 1 and increments it by 1 each time the zone file is saved. ("DNS and BIND," published by O'Reilly and Associates, describes this method as one of the good ways to manage serial numbers.) The YYMMDDnn format is not part of the DNS specification.

However, you can satisfy your provider's requirements simply by using a text editor to open and edit your zone file. The serial number is stored as part of the SOA (start of authority) record at the beginning of the file; it's the first number following the administrator's e-mail address. For example, if today is February 5, 1996, and it's the first change to this file today, you would change the number to 96020501. After you make this change, just re-open the zone file in MacDNS and you're set.

Question 7: How do I serve multiple domains with MacDNS? I want to map "www.intercloud.com" and "www.tyrell.org" to my Web server.

Answer: For each unique top-level domain name you want to serve, choose "New Zone File..." from the File menu and enter the domain name in the Zone Information dialog box. You can have multiple zone files open at once. Even if www.tyrell.org is just intended to be an alias to your Web server at www.intercloud.com, you still need to create a zone file for tyrell.org, because you are serving a host within that namespace. In the Zone Information dialog for tyrell.org, enter the same information that you specified for the intercloud.com zone (with the exception of the Domain Name

field, of course.) Add a permanent host entry for www.tyrell.org. You can then assign the IP address of the "real" host computer (www.intercloud.com) to this host.

When you map entries across multiple domains to a single IP address in this way, it's important to be aware of how reverse (PTR) queries for the IP address are handled. Only the canonical domain name for a given IP address is returned. Currently, MacDNS defines the canonical name for an IP address as the first permanent host entry it finds which matches that address. To ensure that MacDNS returns a particular name for a reverse lookup when cross-domain host names are mapped to an IP address, simply create or open the zone file containing that entry first.

Question 8: How do I set up multiple default home pages on my Web server using MacDNS?

Answer: You don't. Serving up a different default HTML page based on the domain name in a URL is an issue for HTTP server software (or an add-on product which runs on a Web server computer, such as HomeDoor from Open Door Networks).

Question 9: How do I set up a default MX record for my domain?

Answer: Enter the name of the default mail exchanger in the dialog box for the host whose name is the same as your domain name. (If there isn't one, then you need to create an "MX-only" host.) There's no need to enter explicit MX information for each host in the domain.

For example, if you are setting up MacDNS to serve "mydomain.net.", there are two possibilities:

> You have a host computer named "mydomain.net."
> Choose "Add Permanent Host..." from the Hosts menu to create a host named "mydomain.net."
>
> None of your host computers is actually named "mydomain.net."
> Choose "Add MX-Only Host..." from the Hosts menu to create a host named "mydomain.net."

Enter the MX information in the dialog box that appears. A sample mail exchanger record for "mydomain.net." might look like this:

10 mail.mydomain.net., 20 altmail.mydomain.net.

In this example, a computer named "mail.mydomain.net." is specified as the preferred SMTP mail server for this domain. The numbers 10 and 20 are preference values which indicate the relative priority of the mail exchangers: a lower number means a higher priority. Because "altmail.mydomain.net." has a higher preference value, mail will be routed to it only when the preferred server "mail" is unavailable.

Question 10: How do I set up a wildcard PTR entry for a block of addresses?

Answer: MacDNS does not currently support wildcard entries. Generally, this would be useful if you are running software (such as the Apple IP Gateway) which assigns IP addresses from a pool. To provide reverse name mapping for these IP addresses, you need to create a permanent host entry with a name for each (for example: "IP-pool-1.mydomain.com", "IP-pool-2.mydomain.com", and so on.)

Question 11: What can I do to speed up performance of MacDNS?

Answer: "Detailed" and "Microscopic" log messages can cause a noticeable performance hit. For fastest performance, choose "Important" or "Critical" from the pop-up menu at the bottom of the Message Log window, and keep the window closed when you are not actively monitoring the server.

Question 12: Why do I sometimes see incoming requests in the log file with my local domain name tacked on the end? (i.e. "www.apple.com.mydomain.com")

Answer: This situation usually occurs due to the way your client application and TCP/IP are configured on the client end. If you try to look up a name that isn't terminated with a dot, the client assumes that the name isn't a fully-qualified domain name and appends the default domain name to the end before sending off the request. If your DNS client is using MacTCP, try setting '.' as the default domain name; on the client computer, type a period in the box to the left of where you entered the IP address of the DNS server.

Question 13: How can I add a new hardware/software type for a host? I have a bunch of PCs, but that isn't one of the hardware options.

Answer: It's possible to add new hardware/software types to the popup menus that appear in the Host Information dialog box. However, you'll need to be familiar with ResEdit. Open the MacDNS server application and edit 'MENU' resources ID=8 and ID=9. Each menu item is in the form [name]#[command-ID]. If you add new items to the menu, be sure to continue the command IDs in sequential order (for example, 3002, 3003, 3004, 3005, and so on.) (Disclaimer: This information is provided for testing purposes only. Apple does not recommend or support this modification. Use ResEdit at your own risk.)

Question 14: How can I get rid of the dialog box that asks "Are you sure you want to quit MacDNS?"

Answer: Upgrade to the latest version of MacDNS, which no longer displays this dialog.

For users of versions earlier than 1.0.3, it's possible to remove the dialog by opening 'STR ' resource ID=354 with ResEdit. If the string is '1' (the

default value), the alert is displayed. To disable the alert, change this string to '0'. (Disclaimer: This information is provided for testing purposes only. Apple does not recommend or support this modification. Use ResEdit at your own risk.)

Question 15: I'm setting up MacDNS to serve an intranet at my office. Our network isn't connected to the Internet. Should I just make up arbitrary IP addresses for the hosts in my domain?

Answer: By convention, IP addresses that you assign for a private network should fall within the following three blocks of the IP address space:

10.0.0.0 to 10.255.255.255
172.16.0.0 to 172.31.255.255
192.168.0.0 to 192.168.255.255

Disk Copy 6.1 (Or Later): Supported for Use with Disk Images

All future software releases will be packaged using a new disk image call New Disk Image Format (NDIF).

Apple will only support Disk Copy 6.1 (or later) or Disk Image Mounter 2.1 (or later) to access NDIF images and only support Disk Copy 6.1 (or later) to create NDIF disk images.

The most recent version of Disk Copy can be downloaded from the Apple Software Updates Web site at http://www.apple.com/swupdates.
This article has been archived and is no longer updated by Apple.
With the release of Disk Copy 6.1, Apple began transitioning all software releases (including online software archives) to a new packaging that will make downloading faster and easier. This packaging is a new type of disk image called New Disk Image Format, or NDIF. Disk images in NDIF format are compressed to save space and download time, and decompress transparently when they are in use. You can even mount and install software directly from NDIF disk images on the desktop instead of making floppy disks. The NDIF format also includes check sums which guarantee the data integrity of disk images. With Disk Copy 6.1 (or later), you can make your own NDIF disk images of folders or mounted disks.

Apple's goal is to provide strong assurances that any software packaged in a NDIF disk image is downloaded or otherwise transferred and installed correctly. Therefore, Apple will only support Disk Copy 6.1 (or later) or Disk Image Mounter 2.1 (or later) to access NDIF disk images and only support Disk Copy 6.1 (or later) to create NDIF disk images. If an Apple customer uses a different application to access or create NDIF images, Apple will be unable to provide support if any installation or usage problems occur.

Note: This does not apply to Disk Copy 4.2 format disk images, as its file format is published and available to third parties to implement. Apple however, does not endorse any specific third party application or utility for accessing software packaged in Disk Copy 4.2 format.

Disk Copy 6.1 (or later) or Disk Image Mounter 2.1 (or later) from Apple is the recommended applications to access all disk images released by Apple and the only supported applications to access NDIF disk images; Disk Copy 6.1 (or later) is the only supported application to create NDIF disk images.

Mac OS 8: Unable To Start From Mac OS 8 CD

This article explains an issue with starting up a Macintosh computer with some Mac OS 8 CDs.

This article has been archived and is no longer updated by Apple.

Symptom

The Mac OS 8 CD will not start up.

Solution

This error is caused by AppleTalk being inactive on the computer. The CD was revised in the second printing to prevent this error, but Apple is not going to replace CDs of the first printing for this minor issue.

There are multiple work arounds - these are listed in the preferred order of the least disruption to your computer's settings:

1. Start up to the appropriate Disk Tools disk included in the Mac OS 8 box (there are images on the CD if you need to make replacements). This disk has a CD driver that will recognize Apple CD-ROM drives, and you can insert the Mac OS 8 CD and do your install from there.

2. Starting up with the CD, hold down the Shift key as soon as you see the "happy Macintosh" icon.

3. Start up to your regular hard disk, insert the Mac OS 8 CD, and run the Installer. If you chose this option, make sure you run Disk First Aid to check your hard disk while started to your Disk Tools disk first. As a recommendation, you should use the Clean Install option if you install this way to avoid altering the active System Folder. If you have a third-party CD-ROM drive, you will probably not be able to use the first choice (nor possibly the second), and this choice would be your first.

4. Start up to your regular hard disk, make AppleTalk active, and restart with the Mac OS 8 CD. Once you have finished the installation, you may make AppleTalk inactive again.

5. Reset your parameter RAM (which reactivates AppleTalk) and then you can start with the Mac OS 8 CD. This option is last because resetting parameter RAM may make some undesirable changes to your computer, such as serial port selection, deleting a RAM disk, or changing your choices in the Memory control panel.

The startup error does not represent a problem with your computer, nor does it

indicate a faulty CD disc, so you need not be concerned on those counts.

Apple Menu Options: Clients Freeze when Connecting to Server

When I try to log into my AppleShare server from one of my workstations, the Chooser hangs indefinitely. The "Network Arrows" stay on in the upper left corner of the screen, and I can move the cursor, but I can't get any response from the computer unless I force-quit the Chooser.
This article has been archived and is no longer updated by Apple.
To avoid this symptom, try the following workaround: On client machines running System Software 7.5 and later, disable the Apple Menu Options control panel, or disable "Remember recently used items" in the Apple Menu Options control panel.

Note: Setting the "Remember recently used items" option for "Servers" to zero will not resolve the symptom.

On servers running versions of AppleShare File Server prior to 5.0.2/Mac OS 8.0, disable the Apple Menu Options control panel.

Note: This issue has been addressed in Mac OS 9

This document will be updated as more information becomes available.

iMac: Parallel Printers Adapters

Connecting a parallel printer to a USB capable Macintosh like iMac or PowerBook G3 Series (Bronze keyboard).
This article has been archived and is no longer updated by Apple.
If you own an Epson printer, for approximately $40, you can purchase an Epson kit that includes:

- A parallel-to-USB converter
- A CD with all the software you need
- An installation guide

Both Hewlett-Packard and Alps have announced similar adapters for their printers.

Note: This information applies to customers in North America. Customer's in other parts of the world may not be able to purchase products mentioned in this article.

iMac: Not Supported as Mac OS X Server 1.2.v3 or QuickTime Streaming Server

iMacs are not supported as Mac OS X Server 1.2v3 or QuickTime Streaming Servers.
This article has been archived and is no longer updated by Apple.
The Read Me included with the QuickTime Streaming Server incorrectly states the iMac can run Mac OS X Server. Mac OS X Server is supported on Power Macintosh G3, Macintosh G3 Server, and the Power Macintosh G3 All-In-One. It is not supported on the iMac or PowerBook G3.

iBook, iMac (Slot Loading), G4 (AGP): LinkSys 5-Port Switch Auto-Negotiation

Under certain circumstances, iBook, iMac (Slot Loading), and G4 (AGP Graphics) computers may not be able to establish a link with the LinkSys EtherFast 10/100 Dual-Speed 5-Port Workgroup Switch (model EZXC55W).
This article has been archived and is no longer updated by Apple.
Apple and LinkSys are aware of an auto-negotiation issue that can cause the link to fail between the Workgroup Switch (model EZXC55W) and the following Macintosh computers.

- iBook
- iMac (Slot Loading)
- G4 (AGP Graphics)

Other Macintosh computers are not affected.

If you cannot achieve a link between these Macintosh models and this switch, please contact LinkSys technical support at 800-326-7114.

Final Cut Pro: F15 or Shift and F12 Keyboard Shortcuts

In Final Cut Pro under the View menu for External Video, there is an option for Single Frame. The keyboard shortcut listed for this is F15. My keyboard does not have a F15 key.
This article has been archived and is no longer updated by Apple.
The Single Frame function can be useful for composite or other operations that can take a long time to render. Switching External Video to Single Frame will allow you to output the video to the program monitor when you depress F15 or the Shift and F12 keys.

Note: On the USB Apple Keyboards that ship with Power Macintosh G3 and G4 computers, there is no F15 key. Depressing the Shift and F12 keys will give you the same results.

Published Date: Feb 20, 2012

Final Cut Pro: Compatible PowerBook Computers

This article describes which PowerBook computers are compatible with Final Cut Pro.
This article has been archived and is no longer updated by Apple.
All importing, editing, and exporting features of Final Cut Pro work with PowerBook G3 Series (Bronze keyboard) computers and later.

Video capture and playback to tape features are enabled when using the Newer Technology FireWire 2 Go or Ratoc FireWire PC cards in the PowerBook G3 Series (Bronze keyboard) computer. The PowerBook (FireWire) computer has built-in FireWire ports, and does not require a separate PC card.

AppleWorks 6: System Requirements

This document outlines the system requirements for AppleWorks 6.
This article has been archived and is no longer updated by Apple.

AppleWorks 6 for Macintosh

- An Apple computer with PowerPC processor
- 24 MB of memory (RAM) with Virtual Memory set to at least 25 MB
- Mac OS 8.1 or later
- A CD-ROM or DVD-ROM drive
- An Internet connection to access additional templates and clip art images
- QuickTime 4 (installed by the installer if not already present)
- CarbonLib (installed by the installer if not already present)

AppleWorks 6 for Windows

- An Windows-compatible computer with an Intel Pentium processor
- 32 MB of memory (RAM)
- A CD-ROM drive
- Microsoft Windows 95, 98, 2000, or ME English system software
- Quicktime 4.1.2 (included on the AppleWorks CD)
- Internet Explorer 5.5 (included on the AppleWorks CD)

Mac OS X 10.1: About Security Update 2002-08-02

The Mac OS X Security Update 2002-08-02 improves security and updates system software.
This article has been archived and is no longer updated by Apple.
Note: This update should not be confused with Security Update 2002-07-18, or Security Update 2002-07-18 for v10.1.

Important: Read Before Installing

1. An Admin user password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Users from the View menu. Select an Admin user and click Edit User. Click the Password tab. Change the password and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

Enhancements delivered with this update

This update includes fixes previously delivered with Security Update July 2002 as well as the following security enhancements:

- Includes a later version of OpenSSL.
- Includes a later version of Sun RPC.
- Includes a later version of Apache Mod_SSL.

Installation

You may use either a standalone installer or Automatic Software Update.

Automatic Software Update

To learn about this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

Standalone Installer

A standalone installer is available from Apple Software Downloads (http://www.apple.com/swupdates/).

Mac OS X 10.1.5 and Security Update 7-18-02 are prerequisites for this update. For more information, see technical document 106713, "**Mac OS X 10.1: Chart of Available Software Updates.**"

Do not reinstall earlier Mac OS X updates

You should not reinstall earlier updates after using this update, including:

- Any numbered Mac OS X 10.0 update
- Mac OS X version 10.0 or 10.1
- Any numbered Mac OS X 10.1 update
- Security Update April 2002
- Security Update July 2002

Updates should be installed in the correct order. If for any reason you need to reinstall an earlier software update, the Mac OS X startup volume should be erased, after first backing up important documents and data. Reinstall Mac OS X, and install necessary updates in the correct order.

Mac OS X 10.2.2: Sluggish system performance after installing HP printer drivers

After installing some HP printer drivers, the computer becomes sluggish or stops responding.
This article has been archived and is no longer updated by Apple.
When you install the driver software for certain HP products, the computer becomes sluggish or stops responding. Overall system performance degrades over time. Under certain conditions a kernel panic may result, forcing a restart.

This document applies to Mac OS X 10.2.2 and these products:

- HP Photosmart
- HP PSC (printer/scanner/copier) software
- Officejet D or G Series All-in-One

Using these HP products with earlier versions of Mac OS X, for example Mac OS X 10.2.1, does not produce this symptom.

This issue may be avoided by updating to Mac OS X 10.2.3 or later.

The following information may be referenced for Mac OS X 10.2.2.

Apple and HP have identified the causes of this issue, and are working closely together on a resolution. For more information, see this HP website.

As a workaround, uninstall the HP driver to return the system performance to previous levels. Restarting the computer or reinstalling the drivers does not resolve this issue.

To uninstall the driver software:

1. Open the HP driver's installer. Proceed through the installation process by entering your passphrase and accepting the license agreement.
2. When offered the option to Easy Install the listed drivers, choose "Uninstall" from the pop-up menu.
3. A dialog appears with this message: "Some software components may be shared by other HP products. Do you wish to "Remove All" components, or "Continue" removal of only specific components?" Click Remove All.

Note: The HPIJS for Mac OS X website (http://www.linuxprinting.org/macosx/hpijs/) offers HP printer drivers that work with Mac OS X 10.2. The site also explains how to install the HPIJS open source software and create a print queue for the driver.

iLife: Cannot See iTunes Files in Other iLife Applications

Under some circumstances, you may not see the iTunes Library in other iLife applications (iMovie, iPhoto, and iDVD).
This article has been archived and is no longer updated by Apple.

Symptom

- When selecting audio for a slideshow in iPhoto, the option to choose music from iTunes is not available. The pop-up menu says "iTunes not found".
- When selecting audio in iMovie, the option to choose music from iTunes is not available. The pop-up menu says "iTunes not found".
- When you click the Audio button in iDVD the message "Launch iTunes or later to populate this list" appears.

Solution

- Run Software Update to make sure QuickTime, Mac OS X and your iLife applications to up to date.
- Make sure that iTunes has been opened at least once.
- The iTunes Music Library.xml file may be unusable. Try recreating the XML file used to populate the music listing. Follow these steps:
    1. Quit iPhoto, iMovie, iDVD and iTunes.
    2. Click the Finder icon in the Dock.
    3. Choose Go > Go to Folder
    4. Depending where your iTunes Music Library is, enter `~/Documents/iTunes` or `~/Music/iTunes` and click Go.
    5. Locate the "iTunes Music Library.xml" file and drag it to the Desktop.
    6. Open iTunes.
    7. Create a new playlist by choosing File > New Playlist.
    8. Quit iTunes.

Open the iLife applications and make sure you can see the iTunes Library in other applications.

PowerBook G4 (12-inch): Audio Captured With USB Device Sounds Distorted If Display Dims or Sleeps

Audio captured through a USB input device may sound distorted if the display sleeps or dims as the computer saves the audio.
This article has been archived and is no longer updated by Apple.

Symptom

Captured audio sounds distorted at the point when the display went to sleep, dimmed, or when you woke it.

Solution

1. Choose Apple menu > System Preferences.
2. Choose View > Energy Saver.
3. Click Show Details.
4. Drag the slider to Never in the "Use separate time to put display to sleep" option.

Power Mac G5: About Audio Playthru

Using third-party software, your Power Mac G5 computer is capable of audio playthru routing.
This article has been archived and is no longer updated by Apple.
To use audio playthru routing with your Power Mac G5 computer, purchase a third-party audio program that supports software audio playthru, such as LineIn from Rogue Amoeba Software or Sound Studio from Felt Tip Software.

Audio playthru routing allows you to hear sound from a microphone or other device plugged into the computer's sound input port.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Power Mac G5: DVD video freezes or stutters, audio cuts out with Digital Audio Output enabled

This article has been archived and is no longer updated by Apple.

When "Digital Audio Output" is selected in DVD Player preferences, video may freeze or stutter, or audio may cut out after you pause a movie.
This document applies to:

- Mac OS X 10.3 through 10.3.2
- DVD Player 4.0
- Power Mac G5 (Dual 2.0 Ghz) computers

Solution

Download and install the Mac OS X 10.3.3 Update or later to avoid this issue.

If you're not ready to update, as a workaround, you can forward (fast forward) a few seconds, then resume playback. If that does not solve the issue, switch to "System Sound Output" in DVD Player preferences.

Published Date: Feb 20, 2012

Mac OS X: Configure Directory Access to Protect Your Mac From a Malicious DHCP Server

You can configure Directory Access or install an update to protect your Mac from a malicious DHCP server.

This article has been archived and is no longer updated by Apple.
Important: Download and install Security Update 12-19-03 to address this issue. You can get this update using Software Update preferences or from Apple Downloads (http://www.info.apple.com/support/downloads.html).

In many cases, your Mac is protected from this kind of exploit because the malicious DHCP server has to be part of your local network, or "subnet". If your computers are on your local network and you have a broadband connection (DSL or cable service) with a Network Address Translation device--such as an AirPort Base Station--this exploit is not possible unless you allow untrusted systems to connect to your local network. The attack is not possible on the public side of a Network Address Translation device and requires the malicious system to be on your local subnet.

If there is a chance that someone has put a malicious DHCP server on your subnet, or if your computer is using an untrusted network, there are two ways to protect your computer depending on if you use a directory service or not. If you don't know if your computer uses a directory service, ask your network administrator or Internet service provider.

You don't use a directory service

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Applications**.
3. Find the Utilities folder and double-click to open it.
4. Open the Directory Access utility.
5. Click the lock button, type your password, and click OK to authenticate.
6. Select the LDAP service and click Configure.
7. Deselect the "Use DHCP-supplied LDAP Server" option. See Figure 1.
8. Click OK. Your computer is no longer susceptible to this exploit.

Figure 1 Deselect the "Use DHCP-supplied LDAP Server" option

You use a directory service

If your Mac is configured to use a directory service, consult with your network administrator before changing any settings. Your network administrator will need to change the default setting from "automatic" to "custom" search policy in the Directory Access authentication tab and specify the correct LDAP server.

Additional information

A DHCP or "Dynamic Host Configuration Protocol" server can automatically make the settings in Network preferences that your computer needs to access the Internet. This greatly simplifies the steps to connect to the Internet because the software does all of the network administration. Many Internet service providers and network administrators depend on DHCP servers to assign your computer an IP or Internet address.

Soundtrack 1.2: Late-Breaking News

This document contains late-breaking information about Soundtrack.
This article has been archived and is no longer updated by Apple.
For current information about product updates, tips and techniques, and qualified third-party devices, visit the Soundtrack website at http://www.apple.com/soundtrack.

Exporting Projects and Tracks

When exporting a project mix or a track, the length of the export file runs from the beginning of the playback region to the end of the playback region if a playback region exists. If no playback region exists, the export file runs from the beginning of the project to the end of the last audio clip in the project. If the project contains effects that produce sound beyond the end of the last audio clip, the export file will extend beyond the last audio clip until the effects stop generating sound. When exporting tracks, the lengths of all the audio files are the same and are based on the length of the longest track.

Duration of Exported QuickTime Files

When exporting a project to a QuickTime movie file, the export file runs from the beginning of the project to either the end of the video file or the end of the last audio clip in the project, whichever is later. The complete video is exported. If the project contains effects that produce sound beyond the end of the last audio clip, the export file will extend beyond the last audio clip until the effects stop generating sound. Projects exported to QuickTime are exported at a bit depth of 16 bits, whether the Export Bit Depth setting in the Project pane of the Preferences window is set to a bit depth of 16 bits or 24 bits. QuickTime is limited to an export bit depth of 16 bits. Some video files with a .mov extension, particularly video files created using some versions of iMovie 3 and movies exported from iMovie as Full Quality DV, may not be in a standard QuickTime movie format. If you try to export a project with a video file, and see an alert that the video is not a standard QuickTime movie, export the video from another application such as Final Cut Pro or QuickTime Pro to create a standard QuickTime movie of the file before exporting to QuickTime in Soundtrack. Note that Soundtrack cannot export a QuickTime file when the sample rate is 96 kHz.

Deleting Files in a Project

When a media file has been added to the Timeline of a project, and you move the file to the Trash, and then close the project, the file cannot be deleted from the Trash. An alert appears, saying that the file is still in use. To delete the file, quit Soundtrack, and then empty the Trash.

Similarly, when an audio file has been opened in Soundtrack Loop Utility, and you move the file to the Trash and then close the Soundtrack Loop Utility window, the file cannot be deleted from the Trash. An alert appears, saying that the file is still in use. To delete the file, quit Soundtrack Loop Utility, and then empty the Trash.

Placing Beat, Time, and Scoring Markers

If a beat marker or a time marker is placed at the same position as a Final Cut Pro scoring marker, the beat or time marker cannot be moved or deleted.

Video Files Located on a Server May Lose Synchronization During Recording

When you record audio in a project that contains a video file, if the video file is located on a server, the video's audio may not be synchronized with the project while recording. You may also experience Write errors while recording. To eliminate the problem, download the video file to your computer's hard disk. Similarly, you should not use a network-based device or server as the recording sessions location, as specified in the Recording Sessions Location field in the Recording pane of Soundtrack Preferences.

Importing a Video File With Audio Tracks

When you import a video file into a Soundtrack project, and the video file contains multiple audio tracks, only the first audio track is imported into the project.

Using Small Screen Resolutions

Soundtrack is intended to be used at a screen resolution of 1024 x 768 pixels or higher. If your computer is set to a screen resolution smaller than 1024 x 768, layouts may not display correctly, and changing the layout may cause unpredictable screen behavior.

Mute Always Overrides Solo

When both the Mute and the Solo buttons are selected simultaneously, Mute always overrides Solo. For instance, if you have multiple percussion tracks soloed, you can mute one track or multiple tracks to hear individual volume levels in relation to each other. As you unmute each track, those percussion tracks are still soloed.

Solo Doesn't Affect Preview

If you solo a track, Preview still plays. This allows you to preview different drum loops with a soloed guitar, for example.

Using Undo in Soundtrack Loop Utility

When you choose Edit > Undo in Soundtrack Loop Utility, the text is removed from the current and previously selected text fields.

Splitting a Clip

To split a clip into segments, set the playhead at the point where you want to make the split and then choose Edit > Split, or press S. (The Soundtrack User's Manual on page 95 incorrectly says to press K.)

New Apple Applications Page for Pro Apps Developers

The Apple Developer Connection website has launched a new page, Apple Applications, that is a one-stop destination for developers creating content or extensions for Pro Applications such as Soundtrack. On this page, developers can find late-breaking news of interest and technical resources, including developer documentation, special articles, and SDKs. Developers can also sign up for a new Pro Apps Developer mailing list. The URL is http://developer.apple.com/appleapplications.

Xserve RAID: Which Fibre Channel cables can I use?

Learn about the different types of Fibre Channel cables used with Xserve RAID.
This article has been archived and is no longer updated by Apple.
The first generation Xserve RAID has HSSDC2 connectors on the controller modules, while the second generation Xserve RAID has SFP connectors.

Since there are two different connectors available on the Xserve RAID controllers, SFP and HSSDC2, verify the connector type before ordering cables. If you need to order Apple Copper Fibre Channel cables with HSSDC2 to SFP connectors or cables with SFP to SFP connectors, they are both available from the Apple Store (http://www.apple.com/store/).

Note: The Apple Fibre Channel PCI card available from the Apple Store has SFP connectors. The card includes two 2.9m Apple Copper Fibre Channel Cables (SFP to SFP).

Power Mac G5: Issues after installing Mac OS X 10.3.2 and Firmware Update 5.1.4

Update to Mac OS X 10.3.3 or later if your Power Mac G5 computer experiences certain issues after installing Mac OS X 10.3.2 Update and Firmware Update 5.1.4.
This article has been archived and is no longer updated by Apple.
These issues may occur:

- Applications stop responding ("freeze") or won't open.
- The CD/DVD tray does not open when you press the Media Eject key but does if you click the eject button in the Finder.
- The computer stops responding ("hangs") when you turn it on, restart, or shut down.

The solution is to update to Mac OS X 10.3.3 or later.

Xserve RAID (SFP): Troubleshooting a fiber optic cable connection

Learn to troubleshoot a fiber optic cabling issue.
This article has been archived and is no longer updated by Apple.

The Apple Copper Fibre Channel Cable (SFP-SFP) may have intermittent connection issues if it isn't installed correctly between the Fibre Channel switch and Apple Fibre Channel PCI card in the host computer.

This may happen when using:

- Xserve RAID (SFP)
- Apple Copper Fibre Channel Cable (SFP-SFP)
- Switches without passive SFP support

Try these steps if you have connection issues:

1. Verify that the speed and topology settings on the HBA match those of the switch port. Setting both for automatic negotiation produces the best result.
2. Check with the switch vendor to see if the switches work with passive SFP connectors.
3. Test with an optical LC-LC optical cable and SFP-LC transceivers.

Note: This issue can also occur using third-party Fibre Channel arrays.

Shake 3.5 System Requirements

Before you install Shake 3.5, ensure your Macintosh system meets the following minimum requirements.

This article has been archived and is no longer updated by Apple.

Minimum Desktop Hardware and Software Configuration

- 800 Mhz PowerPC G4 Tower
- Mac OS X 10.3.2 (or later)
- 3-button mouse
- QuickTime 6.5 (or later)
- 1 GB local disk space for caching and temporary files
- 256 MB of RAM
- A video display card with 32 MB of VRAM and Open GL hardware acceleration, such as the NVIDIA 4 MX or ATI Radeon 7500
- 1280 x 1024 display with a required minimum of 24-bit color

Minimum PowerBook Hardware and Software Configuration

- 800 Mhz PowerPC G4 PowerBook
- Mac OS X 10.3.2 (or later)
- 3-button mouse
- QuickTime 6.5 (or later)
- 1 GB local disk space for caching and temporary files
- 256 MB of RAM
- A video display card with 32 MB of VRAM and Open GL hardware acceleration, such as the ATI Radeon 7500
- Optional external monitor with 1280 x 1024 display with a required minimum of 24-bit color

Minimum Server Hardware and Software Configuration

- 1 Ghz PowerPC G4 or higher XServe
- Mac OS X Server 10.3.2 (or later)
- 3-button mouse (optional for render station, required for compositing seat)
- QuickTime 6.5 (or later)
- 1 GB local disk space for caching and temporary files
- 256 MB of RAM
- A video display card with 32 MB of VRAM and Open GL hardware acceleration, such as the NVIDIA 4 MX or ATI Radeon 7500 (optional for render station, required for compositing seat)
- 1280 x 1024 display with a required minimum of 24-bit color (optional for render station, required for compositing seat)

Minimum Requirements for Render-Only Workstations

The Shake 3.5 render-only workstation requires the following minimum hardware and software configuration:

- 500 Mhz or higher PowerPC G4
  Note: PowerPC G4 refers to any Tower, PowerBook, iMac, eMac over 500 Mhz.
- 1 Ghz PowerPC G4 or higher XServe
- Mac OS X 10.3.2 (or later)
- QuickTime 6.5 (or later)
- 1 GB local disk space for caching and temporary files
- 256 MB of RAM

RAM Requirements

Playback performance is a function of RAM, processor, image size, clip length, and graphics card. In Shake, images are loaded into memory and then played back. Current systems cannot achieve real-time playback with 2K-resolution images. However, with sufficient RAM and a good graphics card, files of up to 1K resolution should play back in real time.

Use the following formula to determine the amount of required memory:

width * height * channels * bytes per channel * images = bytes

For example, a single 1024 x 768 RGB 8-bit (1 byte) per channel image is:

1024 * 768 * 3 * 1 = 2359296 bytes

Or, approximately 2.4 MB per frame.

Tip: To convert from bytes to megabytes (MB), divide by 1024 two times (1024 equals the number of bytes per kilobyte). Thankfully, all operating systems come with calculators. For a rough approximation, drop the last 6 digits.

Note: An 8-bit image is 1 byte, a 10 or 16-bit image is 2 bytes, and a float image is 4 bytes.

ColorSync 20-inch Displays: Wave Patterns Across Picture

Vibrations from built-in (or external) audio devices can sometimes cause a wave-like shimmering to appear across the ColorSync 20-inch Display screen. This article addresses the causes and cures of this effect.

Note: The ColorSync 20-inch Display was formerly named the AppleVision 850 Display.
This article has been archived and is no longer updated by Apple.
In the AppleVision 850 AV Display (and other AV displays with built-in speakers), vibration from the built-in speakers may sometimes cause the aperture grill on the monitor to vibrate. Aperture grill vibration is visible as a wave-like shimmering on the monitor screen. At normal volumes, this effect should not occur, but at high volume levels it may be noticeable, especially with low-to-mid-range sounds (100-500 hz, most frequent when playing jazz, classical music, male vocalists).

This effect can also occur on the ColorSync 20-inch Display (formerly known as the AppleVision 850 Display) if external speakers are placed too close to the monitor and played at high volume. To eliminate this, move the external speakers further from the monitor and/or reduce the audio volume.

To eliminate the visual distortion in the AppleVision 850 AV Display, reduce the speaker volume. The audio circuitry monitor is high-powered in order to provide excellent sound quality, not loud volume. Reducing the volume setting will prevent the image from being affected by the sound.

To minimize the effect on either display at high volume, adjust the rotation of the screen image so that the picture is as level as possible. To adjust the rotation from a Mac OS computer:

1. Open the Monitors & Sound control panel, then click the Geometry button.
2. On the Geometry window, click the Rotate button.
3. Use the position buttons (icons) next to the picture of the monitor to fine-tune the rotation. When the rotation of the screen image is set properly, all four sides of the image are parallel to the edges of the screen and the image is rectangular.

If using the display with a DOS- or Windows-based computer:

1. Push any of the control buttons on the left side of the display's front bezel. A control panel will appear on screen.
2. Press the < or > control button until the Geometry menu is selected.
3. Press the V control button until Rotate is selected.
4. Press the - button to rotate the screen image counterclockwise or the + button to rotate it clockwise. When the rotation of the screen image is set properly, all four sides of the image are parallel to the edges of the screen and the image is rectangular.

AppleVision, ColorSync 20-inch Displays: Multiple Monitor Support

I purchased two AppleVision Monitors and am trying to set them up, but my computer only has one ADB port on the back. I tried connecting the ADB cable from the first monitor to the side of the second monitor, but that did not work. Then I tried using a third party ADB splitter cable and the second monitor came up in 640x480 only. How do I set them up correctly?

Note: The ColorSync 20-inch Display was formerly named the AppleVision 850 Display. The "AV" suffix is appended to the monitor name as appropriate.
This article has been archived and is no longer updated by Apple.
To set up two AppleVision displays with a computer that has a single ADB port, be sure to use the recommended Apple shielded connector cable (ADB splitter cable), part number M5556LL/A. This is the only officially supported method of connecting two AppleVision Displays to a single Macintosh ADB port. Setup instructions are in the User Manual for the display.

When some third-party ADB splitter cables are used, AppleVision software may be unable to recognize one or both monitors as AppleVision displays. As a result, the screen resolution of the unrecognized monitor(s) will revert to 640x480, and the AppleVision control strip and control panel will not allow you to select any other resolution besides 640x480.

When you open the AppleVision Setup control panel, a dialog window appears on AppleVision Display #1. This is the display designated through the Monitors control panel as the startup display.

You are also able to adjust the bit depth and resolutions for both displays separately through the control strip at the bottom of the display. The displays appears as two separate sections with the name of the display at the top of these sections.

Example: AppleVision 1710/AV Display 1 and AppleVision 1710/AV Display 2

If two AppleVision 1710AV Displays are used you will only have microphone and speaker capabilities through one of these displays by connecting the sound and microphone connections to your Macintosh computer. There may be third-party solutions allowing you to connect two connections to both ports on the back of the computer.

Notes:

- Some NuBus or PCI video cards may only support one resolution; 640x480, when using any Multiple Scan Display.
- A limit of two AppleVision displays are supported simultaneously on one CPU.
- It is recommended you install the latest version of the Apple Display Software to prevent errors when the software loads. (Apple Display Software supercedes and replaces AppleVision software as of version 1.5.3 of AppleVision software.)

AppleVision 1710, ColorSync 17-inch Displays: Screen flickers without ADB

Incorrect cable setup can cause the following symptoms on an AppleVision 1710, 1710AV displays and on ColorSync 17-inch Displays (AV model included) connected to a Power Macintosh 4400: If you turn on the computer first and then turn on the monitor, the screen may come up in 640-by-480 resolution and may flicker.

Note: The ColorSync 17-inch and 20-inch Displays were formerly named the AppleVision 750 and AppleVision 850 Displays, respectively. The "AV" suffix is appended to the monitor name as appropriate.

This article has been archived and is no longer updated by Apple.
If an AppleVision monitor's ADB cable is not connected to the computer, the monitor will default to 640-by-480 resolution and you will be unable to use AppleVision software to configure your monitor. In addition, if you are using the display with a Power Macintosh 4400, the screen may flicker if two conditions are met:
- the ADB cable is not connected AND
- you turned on the computer before turning on the monitor. (If you power on the monitor before you turn on the computer, the flickering will not occur.)

To correct this problem, shut down the computer and the monitor (use the monitor's on/off button), and check to be sure that:
- the monitor's ADB connector is securely plugged in to the Macintosh ADB connector.
- the monitor's video connector is securely attached to the Macintosh built-in video connector.
- the Macintosh keyboard cable is connected to the monitor's ADB port.
See your User's Manual for complete setup instructions.

After verifying that the cable setup is correct, power on the computer and display, and check to make sure that the screen is now normal.

ColorSync 17-inch Display: Description

This article contains a description of the ColorSync 17-inch Display.

Note: The ColorSync 17-inch Display was formerly named the AppleVision 750 Display.
This article has been archived and is no longer updated by Apple.
The ColorSync 17-inch Display is a superior quality color display that's perfect for business tasks such as desktop publishing, working with spreadsheets, and creating presentations. It combines multiple scan capabilities with the next generation Trinitron tube, and offers a host of advanced Apple DigitalColor technology features setting a new standard in clarity, color accuracy, and viewing flexibility. And it is compatible with DOS and Windows software-based computers as well as Macintosh and Power Macintosh systems.

Everyone wants accurate color on their monitor, and the Apple Digital Color technology features of the ColorSync 17-inch Display let it offer truly unprecedented image quality. It includes internal self-calibration technology-- eliminating the need to spend time and money to maintain accurate calibration. In addition, the ColorSync 17-inch Display provides automatic screen-to-print matching using Apple's unparalleled ColorSync 2.0 technology. It can also be adjusted to compensate for many of the effects of ambient lighting and CRT phosphor aging. And its intuitive Macintosh software provides control over all screen functions, including geometry, brightness, contrast, and variable color temperature.

Sony Trinitron screens have long been known for their outstanding image quality, and the screen of the ColorSync 17-inch Display is no exception. In fact, it represents the next generation of Trinitron technology, featuring not only an incredibly vivid, sharp picture, but also a design that reflects the light in the room away from your eyes. And its multiple scan technology gives you the flexibility you need, letting you view more than two full pages of information at a time at an impressive 1,280 by 1,024 pixels.

Yet even with all of these features, the ColorSync 17-inch Display remains affordable, making it the perfect choice for anyone whose work requires a vivid, accurate, and flexible color viewing solution.

Features

Outstanding Image Quality

- Features next-generation Trinitron technology for clear, sharp pictures and vivid color
- Provides outstanding color matching and extremely accurate on-screen color representation
- Adjusts luminance and color temperature to provide outstanding image quality in any ambient light
- Keeps colors accurate and balanced over time, even as the CRT ages

Advanced Functionality

- Uses multiple-scan electronics that enable a high level of user flexibility
- Offers a range of resolution modes up to 1,280 by 1,024 pixels
- Features built-in intelligence, to ensure that your monitor remains calibrated
- Provides advanced but easy-to-use software control over all screen functions

Compatibility

- Works with MS-DOS and Windows software-based systems
- Works with Power Macintosh, Macintosh Quadra, Macintosh Centris, Macintosh II (with video card), and PowerBook computers*
- System software version 7.1 or later

* Not all models and configurations are capable of driving the monitor to the highest resolution it supports.

Ordering Information

ColorSync 17-inch Display, Order No. **M6159LL/A**

- ColorSync 17-inch Display
- AppleVision software
- PC adapter
- Integrated, attached video and Apple Desktop Bus cable
- Power jumper cable
- Ambient light wand
- User's guide
- Limited warranty

AppleVision 750 AV Display: Description

This article contains a description of the AppleVision 750 AV Display.
This article has been archived and is no longer updated by Apple.

Overview

The AppleVision 750 AV Display is an exceptional audiovisual display designed with the mainstream business user in mind but well-suited to a wide variety of tasks, including desktop publishing and work with multimedia. An appropriate choice for those who require flexibility in a display, it combines multiple-scan capabilities with the next-generation Trinitron tube, offers a host of advanced Apple DigitalColor technology features, and boasts built-in speakers and a microphone. And it is compatible with DOS and Windows software-based computers as well as Macintosh and Power Macintosh systems.

Image quality is the first concern of anyone buying a monitor, and the AppleVision 750 AV Display is outstanding in this area. It features internal self-calibration technology, eliminating the need to spend time and money to maintain accurate color calibration. The AppleVision 750 AV Display provides automatic screen-to-print matching using Apple's unparalleled ColorSync 2.0 technology. It can also be adjusted to compensate for many of the effects of ambient lighting and CRT aging. And its intuitive Macintosh software provides control over all screen functions, including geometry, brightness, contrast, and variable color temperature.

But beyond outstanding image quality, the AppleVision 750 AV Display has something unique to offer: integrated multimedia features that provide unprecedented performance and capabilities. Its built-in stereo speakers let you enjoy high-quality CD sound without having to give up any of your valuable desk space. And its directional microphone, capable of voice recognition, lets you annotate documents, as well as take full advantage of applications that utilize speech.

The AppleVision 750 AV Display is based on the next generation of Trinitron technology, which means that it offers an extremely vivid, sharp picture as well as being incredibly easy on the eyes. And its multiple-scan technology gives you the flexibility you need, letting you view more than two full pages of information at a time at an impressive 1,280 by 1,024 pixels.

Vivid, accurate color, outstanding multimedia capabilities, and flexibility -- the AppleVision 750 AV Display brings it all to your desktop, to put you in the vanguard of the multimedia revolution.

Features

Outstanding image quality

- Features next-generation Trinitron technology for clear, sharp pictures and vivid color
- Provides outstanding color matching and extremely accurate on-screen color representation
- Adjusts luminance and color temperature to provide outstanding image quality

iDVD 2.0: Obtaining Best Results when Exporting iMovies for iDVD

This document discusses how to obtain the best results when exporting iMovies for use with iDVD.
This article has been archived and is no longer updated by Apple.
To obtain the best results when exporting your iMovies to work with iDVD, upgrade your version of iMovie to version 2.0.3 or later. After upgrading to iMovie 2.0.3, re-export your movies.

In iMovie 2.0.3, choose Export Movie from the File menu and then choose For iDVD from the "Export to" pop-up menu.

iMac (Flat Panel): How to Connect USB Audio Equipment

This document explains how to connect audio equipment to the (iMac Flat Panel).

This article has been archived and is no longer updated by Apple.

You can use your iMac's built-in microphone to record sound or give spoken commands to your computer. You can also input sound into your computer from USB audio equipment, such as a USB microphone.

To connect USB audio equipment:

1 Turn the audio equipment on.
2 Lower the volume level on the audio equipment.
3 Connect a USB audio device to one of your computer's USB ports.
4 If necessary, select the device you want to record from in the Sound control panel.
5 Use your favorite sound-recording application to record.

For more information, see the documentation that came with the audio equipment and the sound-recording application.

See technical documents:

Macintosh Manager 2.1: How to Add Administrator Accounts

This document discusses adding administrator accounts.
This article has been archived and is no longer updated by Apple.
Administrator accounts define which users can manage your network and workgroups using Macintosh Manager. A Macintosh Manager administrator can adjust all settings throughout Macintosh Manager. A workgroup administrator can add or modify user accounts or workgroups within the limits set by a Macintosh Manager administrator.

To add an administrator account:

1. In Macintosh Manager, click the Users tab, then click the name of a user in the Imported Users list.
2. Choose Workgroup Administrator or Macintosh Manager Administrator from the User Type pop-up menu. Then click Save.

If you import a user who has server administrator privileges for the Mac OS X Server, you need to follow the procedure above to make the user a Macintosh Manager administrator.

Note: Mac OS X Server Administrator users will not be able to access their home directories while logged into Macintosh Manager clients. See technical document 60876: "**Macintosh Manager 2: Logging in As a Mac OS X Server Admin User**" for more information.

Bluetooth: How to Connect to the Internet with a Bluetooth-Enabled Phone

This document discusses connecting to the internet with a Bluetooth-enabled phone.

This article has been archived and is no longer updated by Apple.

To set up your computer to connect to the Internet with a Bluetooth-enabled phone:

1. Choose your phone from the Bluetooth status menu in the menu bar.
2. Open the Network pane of System Preferences.
3. Choose "bluetooth modem" from the Show pop-up menu.

Note: Make sure the "bluetooth modem" port is turned on in the Network pane of System Preferences. To do this, choose Active Network Ports from the Show pop-up menu, then select "bluetooth modem."

4. Enter your ISP information in the TCP/IP and PPP tabs.
5. Choose the model of your phone from the Modem pop-up menu in the Modem tab.

To connect to the Internet:
1. Choose Open Internet Connect from the Bluetooth status menu in the menu bar.
2. Choose "bluetooth modem" from the Configuration pop-up menu.
3. Click Connect.

LaserWriter 8500: How to Install the Toner Cartridge

This document discusses installing the toner cartridge.
This article has been archived and is no longer updated by Apple.
The toner cartridge contains the dry powder that the printer uses instead of ink. Each cartridge lasts approximately 14,000 pages, depending on the kind of printing you do. If you use the printer to produce more graphic images than text, you may need to change cartridges more often.

WARNING: Use only toner cartridges designed for use with your printer. Other cartridges will not fit and may damage the printer.

1. Open the multipurpose tray and then the printer top cover.

If you're replacing a toner cartridge, remove the old cartridge.

To remove an old cartridge, grasp the orange handles on the cartridge and pull toward you.

2. Take the cartridge out of its packaging.

3. Distribute the toner powder by gently rocking the cartridge back and forth.

4. Firmly pull the tab directly away from the cartridge to remove the sealing tape.

WARNING: Pull the tab straight out of the cartridge. Don't pull too quickly or at an angle-either might damage the seals on the cartridge.

5. Align the rollers on the sides of the toner cartridge with the arrows inside the printer, then slide the cartridge into the printer. Make sure the toner cartridge is inserted all the way and properly seated inside the printer.

6. Close the printer. The top cover clicks into place.
Note: If the printer's top cover does not close properly, the toner cartridge is not installed correctly. Check to make sure the toner cartridge is properly inside the printer.

DVD Studio Pro 1.5: How to Preview

This document discusses previewing.
This article has been archived and is no longer updated by Apple.
You can use Preview Mode to see, hear, and interact with your DVD before you spend time building it.

Preview does not work if any of the following are missing: assigned picture assets for the menus for all languages you've created; one basic asset assigned for each track and slideshow; the startup action for the disc.

1. Select an item to preview. You can select the disc, a track, angle, marker, story, menu, audio stream, video stream, or slideshow. Selecting the disc previews its startup behavior.
2. Choose Preview from the Item menu, or click the Preview button in the Graphical View.
3. Use the onscreen remote control to navigate through your project. The remote control keys (except for the Stop key) will do whatever actions you assigned to them in the Property Inspector.
4. When you're finished, click the Stop key on the remote control or the Esc key on the keyboard to return to the DVD Studio Pro workspace.

Depending on the speed of your processor, you may be able to preview only a limited number of angles.

Some set-top player models may be programmed slightly differently than Preview Mode and navigation may not work exactly the same way on those models.

DVD Studio Pro 1.5: How to Add Subtitles

This document discusses adding subtitles.
This article has been archived and is no longer updated by Apple.
DVD Studio Pro includes the Subtitle Editor that you can use to create and import subtitle streams. For detailed information on using this software, see the DVD Studio Pro User's Manual.

Once your subtitle streams have been created and imported into the Assets container in the Project View, you can add them to your project.

Click the subtitle icon on the track tile you want to add subtitles to. (The subtitle icon is next to the audio icon.)
Choose New Subtitle from the Item menu.
Name the subtitle in the Property Inspector, and choose an asset and language from the pop-up menus in the General area.

If you create subtitles in more than one language, you can switch between them using the Subtitle key on the remote control.

(This document contains information from Help Center, the help system included with your computer.)

DVD Studio Pro 1.5: About DVD Studio Pro

This documents contains information about DVD Studio Pro.
This article has been archived and is no longer updated by Apple.
DVD Studio Pro is software for authoring DVD-Video discs. It works with video, audio, graphics, and text materials that you have already created and edited and orchestrates them into an interactive DVD, complete with menus, buttons, subtitles, and alternate languages or sound tracks. You can script buttons to perform actions, define links between parts of your material, and see a real-time preview of your DVD as you create it.

Before you use DVD Studio Pro you need to create, edit, and assemble your source material. The video and audio you use in your project then needs to be converted to DVD-compliant formats, a process called encoding.

When you're finished putting together your project, you can use DVD Studio Pro to build it. The finished product is either a DVD-Video on a DVD-R, DVD-RAM, DVD-RW, or DLT tape, or a folder on your hard disk called Video_TS that contains all the information needed to write a DVD. You can open and play the contents of this folder as if it were on a DVD using the Apple DVD Player.

DVD Studio Pro 1.5: How to Create a Motion Menu

This document discusses creating a motion menu.
This article has been archived and is no longer updated by Apple.
Menus are graphic or video backdrops for buttons. A menu that uses a video clip for the background is called a motion menu. Motion menus can also include composited video images on the clip so it appears that each button is playing its own small video clip.

Before you can create a menu, you need to add assets to the Assets container in the Project View.

1. Click the Add Menu button at the bottom of the Graphical View.
2. Drag a video asset from the Assets container to the menu tile, or select the menu tile and choose an asset from the Asset pop-up menu in the Picture area of the Property Inspector.
3. To set the video for a motion menu to repeat (loop) indefinitely, select the menu and choose On from the Loop pop-up menu in the Timeout area.

You cannot create a motion menu by dragging a video asset from the Assets container to the Graphical View. This creates a track instead of a menu.

(This document contains information from Help Center, the help system included with your computer.)

DVD Studio Pro 1.5: How to Work with Buttons

This document discusses working with buttons.
This article has been archived and is no longer updated by Apple.
You use the menu editor to move and resize buttons, create additional buttons, and assign actions to buttons. When you open a new menu in the menu editor, one button is already created.

Double-click a menu's thumbnail area to open the menu editor.

To move a button, select it and drag it by its center.

To resize a button, select the button and move your pointer to the button's flashing border. When the pointer changes to a set of arrows, drag the border.

To create additional buttons, position the pointer where you want the top-left corner of the button to appear and drag to create a rectangle.

To assign an action to a button, select the button and choose an item from the "Jump when activated" pop-up menu in the Action area of the Property Inspector.

The button's rectangle represents its "hot area." When the viewer uses your DVD in a computer and clicks inside the hot area, the button is activated (that is, it changes color and the action assigned to it is carried out).

DVD Studio Pro 1.5: Using Photoshop Layers to Specify Button Appearances

This document discusses using Photoshop layers to specify button appearances.
This article has been archived and is no longer updated by Apple.
You can use the Photoshop Layer method to specify what the buttons on a still menu look like when they are selected and activated. ("Selected" means that if the viewer clicks the Enter or OK key on the remote control, that button will be activated and its action will be carried out.)

To use the Photoshop Layer method, you need a Photoshop file with at least one layer for the background and the normal state buttons, plus one additional layer for the selected and activated states of each button.

1. Make sure the Photoshop file is in the Assets container.
2. Select a menu. In the Picture area of the Property Inspector, choose a Photoshop file from the Asset pop-up menu.
3. In the Property Inspector, click "Layers (always visible)."
4. In the box that appears, select the layers to use for the normal state of the buttons.
5. In the menu editor, select a button, and choose which layers of the Photoshop file to reveal for each state of the button (in the Display area of the Property Inspector).
6. To check your work, choose Show Selected State and Show Activated State from the Buttons menu.

It's easiest to work with the Layer method if you organize the layers according to the button positions in the containers in the Project View. (First the layers for the background, then the layers for Button 1, then the layers for Button 2, and so on.) If you create empty layers beginning with a hyphen ("-") they appear as menu dividers in the Property Inspector's Layers menu.

If your DVD has multiple languages, you need a Photoshop file or layers for each language. If you use multiple Photoshop files for a single set of menus, the layers must be named and organized identically on all of them.

(This document contains information from Help Center, the help system included with your computer.)

DVD Studio Pro 1.5: Using the Highlighting Method to Specify Button Appearances

This document discusses using the highlighting method to specify button appearances.
This article has been archived and is no longer updated by Apple.
You use the highlighting method to specify button appearances in motion menus. (You can also use this method in still menus. You cannot use the Photoshop Layer method in motion menus.)

There are two parts to using the highlighting method: If you want to use an overlay image that determines which parts of the button's active areas will change color, you first need to choose one in the Property Inspector. The overlay image can be in Photoshop or PICT format, and must be added to the Assets container. You then need to specify one or two color and transparency sets for selected and activated buttons and assign a set to each state of each button.

1. Open the menu you want to work with in the menu editor by double-clicking its thumbnail area.
2. If you're going to use an overlay image, choose the asset containing your overlay image from the Overlay Picture pop-up menu (in the Button Hilites area of the Property Inspector). If the overlay image is a Photoshop file, you also need to choose its layer.
3. To specify color and transparency sets, choose colors in the Selected Set and Activated Set pop-up menus and set the percentage of color to use for each state. 0% is completely transparent and 100% is completely opaque.
4. Select a button on the menu. In the Display area of the Property Inspector, choose a highlight set from the Use Hilite pop-up menu.
5. Repeat step 4 for each button on the menu.
6. To check your work, choose Show Selected Hilites and Show Activated Hilites from the Buttons menu.

If you want more control over the way your overlay works, choose No from the Use Simple Overlay pop-up menu (in the Button Hilites area of the Property Inspector). The advanced highlighting controls that appear let you specify the highlight color and transparency for each of four shades in an overlay image.

DVD Studio Pro 1.5: How to Create Interactive Markers

This document discusses creating interactive markers.
This article has been archived and is no longer updated by Apple.
You can place buttons on top of tracks (or parts of tracks) that are assigned a video stream. Buttons on tracks are called interactive markers.

Because the video stream won't usually include button graphics, you will probably need to apply an overlay image to define the shape and position of the interactive markers. The overlay image can be in Photoshop or PICT format, and must be added to the Assets container.

1. Open the marker editor by double-clicking the track's thumbnail area.
2. Select or create a marker at the point where the buttons will appear.
3. In the Buttons area of the Property Inspector, choose an item from the Overlay Picture pop-up menu. If you choose a Photoshop file, you must also choose its layers.
4. Specify the colors and transparency levels for the normal, selected, and activated states of your buttons.
5. Specify the Default Button (the one that is initially selected).
6. Create and position buttons over the button graphics.
7. Select each button and in the Property Inspector name it and assign actions to it.
8. Repeat the process for each marked segment of your track that you want to have buttons. If you want subsequent interactive markers to have the same properties as the ones you already created, choose the original interactive marker from the Use Buttons Of pop-up menu.

Interactive markers are created using the subtitle feature of DVD players, so you cannot combine subtitles and interactive markers within one track.

DVD Studio Pro 1.5: How to Create a DVD@CCESS Web Link

This document discusses creating a DVD@CCESS Web link.
This article has been archived and is no longer updated by Apple.
You can attach a DVD@CCESS Web link to a track, marker, slideshow, or menu. When that item plays, the Web browser opens and displays the Web page (or other URL).

1. Select a track, marker, slideshow, or menu.
2. In the Property Inspector, choose URL in the @ccess Type pop-up menu in the @ccess area.
3. Enter a name and URL for the link in the @ccess area. Be sure to include "http://" or another prefix. You can enter any valid URL, including "mailto" or "ftp." You can also create a URL that opens a file on the DVD by entering the file's path name.
4. To activate a link from a button, create a menu that has the link attached. Set the button to jump to that menu when activated.

If you create DVD@CCESS links in your DVD, installers for those links are included on the final disc when you build it. Depending on the kind of computer you are using to play your DVD, you may need to install the installers for the Web links to work.

LaserWriter 8500: Printer is not Listed in the Chooser or the Desktop Printer Utility

This document discusses if the printer is not listed in the Chooser or the Desktop Printer Utility.
This article has been archived and is no longer updated by Apple.
If you've selected the LaserWriter 8 icon but your printer is not named in the list of printers, one of the following may be the cause.

The printer has been turned off. Make sure it is plugged in and turned on, and wait for the Ready light to turn on.

The communication settings are not set correctly. See "LaserWriter 8500: How to Adjust Communication Settings" and "LaserWriter 8500: How to View and Change Communication Port Settings". See also Appendix D for a list of acceptable values. To reset the communication settings to their factory default values, set the communication switch to the Reset (out) position. Turn the printer off and back on again. Set the communication switch to the Normal (in) position.

Someone may have renamed the printer. Check the startup page to see if the name has changed.

If you are using an AppleTalk network that contains zones, you may not have selected the correct zone for the printer.

There's a problem in the network cable system somewhere between your computer and the printer you want to use. Make sure that all the cables are properly connected. If you still can't resolve the problem, the printer's electronics or the network connector boxes may not be functioning properly. Call an your network administrator or an Apple-authorized dealer.

The printer has the same name as other printers on the network. If that's the case, the printer automatically appends a number to the end of its name when it's turned on. The number may change each time you turn on the printer. The printer administrator can change the name using the Apple Printer Utility for the Mac OS or the Apple LaserWriter Utility for Windows. You can identify your printer by looking for the printer with the same Ethernet address (use the Apple Printer Utility for the Mac OS or the Apple LaserWriter Utility for Windows) that is printed on the startup page.

Check the Network control panel to make sure the correct network is selected.

LaserWriter 8500: How to View and Change Communication Port Settings

This document discusses viewing or changing communication settings.
This article has been archived and is no longer updated by Apple.
The standard communication settings of the printer work for most environments. To make sure the printer is set up to use the standard settings, check that the communication switch on the left side of the printer is in the Normal (in) position. The switch is located below the interface connectors.

You can view and change the standard communication settings for the printer with the Apple Printer Utility for Mac OS or Apple LaserWriter Utility for Windows .

You make changes to the communication settings with the printer's communication switch set in the Normal (in) position. This makes all communication settings available for changes.

1. Choose Configure Port from the Utilities menu.

2. Choose the port settings you want.

- You can set the Parallel interface to PostScript mode, TBCP, or No Change.
- You can set the LocalTalk interface to PostScript mode or turn it off.
- You can set the EtherTalk interface to PostScript mode or turn it off.
- You can set the NetWare interface to PostScript mode or turn it off.
- You can set the TCP/IP interface to PostScript mode or turn it off.

3. Click Set Port.

Resetting the communication settings

1. To restore the communication settings to the factory defaults:

- Set the communication switch on the printer to the Reset (out) position.
- Turn the printer off and back on again.
- Set the communication switch on the printer to the Normal (in) position.

Communication settings

The following table shows the default communication settings. For information about using the communication switch to adjust communication settings, see "LaserWriter 8500: How to Adjust Communication Settings." To change or view the current communication settings, use the Apple Printer Utility for Mac OS computers or the Apple LaserWriter Utility for Windows.

Normal (in) switch position

These settings can be changed to the following modes:

Port	Protocol	Mode
LocalTalk	LocalTalk	PostScript, Off
Ethernet	EtherTalk NetWare TCP/IP	PostScript, Off
Parallel	TBCP	PostScript, Off

When the communication switch is in the Reset (out) position, the following values are used:

Port	Protocol	Mode
LocalTalk	LocalTalk	PostScript
Ethernet	EtherTalk NetWare TCP/IP	PostScript
Parallel	TBCP	PostScript

Note: When the communication switch is in the Reset (out) position, a startup page is printed each time the printer is turned on and the Extended Job Status settings are removed.

34850 LaserWriter 8500: How to Adjust Communication Settings

Published Date: Feb 20, 2012

LaserWriter 8500: How to Adjust Communication Settings

This document discusses adjusting communication settings.
This article has been archived and is no longer updated by Apple.
Though you can adjust many of the printer's communication settings, the normal settings work for most environments. To make sure the printer is set up to use the normal settings, check the communication switch on the left side of the printer to make sure it's in the Normal (in) position.

Why customize communication settings?

Though the standard communication settings work well for most environments, you might want to customize communication settings to turn off network interfaces you don't need. For example, if you know the printer will never receive a NetWare message over the network, you can turn off the interface and stop the printer from sending out unnecessary NetWare packets.

How to customize communication settings

To customize communication settings, use either of the following two programs:

- Apple Printer Utility for the Mac OS
- Apple LaserWriter Utility for Windows

What to do next

Finish preparing the printer and completing the network connections by reading one or more of the following chapters:

- Chapter 2 explains how to administer the printer on an AppleTalk or TCP/IP network and how to help Mac OS users start using the printer.
- Chapter 3 explains how to administer the printer on a Novell NetWare or TCP/IP network and how to help Windows and DOS users get started using the printer. It also explains how to set up a direct connection to an IBM PC or compatible computer.
- Chapter 4 explains how to set up the printer on a TCP/IP network and how to help UNIXÂ® users get started using the printer.

eMac: How to Install the Optional Stand

This document explains installing the optional stand.

This article has been archived and is no longer updated by Apple.

Follow the instructions in this sheet carefully. Failure to follow these instructions could damage your equipment and void its warranty.

Note: Written and video instructions covering customer-installable parts are available at http://www.info.apple.com/installparts/.

Tools Required

The tool is supplied with the stand.

To install the stand:
1. Save open documents and quit all open applications.
2. Turn the computer off by choosing Shut Down from the Special menu.
3. Unplug all cables.
4. Place a soft towel or cloth on the desk or surface.
5. Turn the computer over onto the cloth.

6. The stand attaches to the locations circled below.

7. Remove the screw located between the computer's feet.

8. Position the stand on top of the screw holes.

9. **Note**: The stand slides back and forth. To attach the first screw, slide the stand toward the back of the computer.

10. Tighten the first screw.

11. Slide the stand forward to access the two rear screws.

12. Tighten the screw on the left.

13. Tighten the screw on the right.

14. Carefully turn the computer over. The computer now swivels horizontally and vertically.

iPhoto 1.1.1: How to Move the iPhoto Library Folder to a New Location

This document discusses moving the iPhoto Library folder to a new location.
This article has been archived and is no longer updated by Apple.
The iPhoto Library folder, located in your Pictures folder, contains photos you have imported into your photo library and any albums you've created using iPhoto. If you want to move your iPhoto Library folder to a new location, you must create an alias for it in your Pictures folder.

IMPORTANT: If you move, delete, rename, or otherwise tamper with files or folders in the iPhoto Library folder, you may be unable to see your pictures in iPhoto.

To move the iPhoto Library folder to a new location:

1. Drag the folder to the new location.
2. Select the folder in the new location and choose Make Alias from the File menu.
3. Drag the iPhoto Library folder alias to the Pictures folder and name it iPhoto Library.

iSync 1.5: How to set up a USB Palm OS device to sync with your computer

This article has been archived and is no longer updated by Apple.

Note: This article applies to iSync 1.5 and Mac OS X 10.3.9 and earlier. If you are using iSync 2.x in Mac OS X 10.4 or later, see this article for instructions.

If you have a Palm OS-based device, you can use iSync to synchronize your computer's Address Book contacts and iCal calendar and To Do information with the contacts, calendar, and to do list on your Palm device through USB. Here's how to set this up.

If your Palm device uses Bluetooth, see this article for complete wireless syncing instructions.

Important: To avoid sync issues, you should only sync your Palm OS device with one computer. If you add the device to iSync on more than one computer, the information may not sync correctly.

Setting up your device to sync

To add your Palm OS device to iSync 1.5, follow these steps in this order:

1. Make sure that you have iCal 1.0.1 or later installed. You can download the latest iCal update from here.
2. Download and install Palm Desktop version 4.0 or later on your computer, which includes Palm HotSync software.

   Tip: After installing Palm Desktop, it's a good idea to sync your Palm OS device with HotSync at least once before adding your device to iSync. Why? Palm HotSync may need to install important updates and other items on your handheld device. You may also be asked to establish a user account to use with your Palm device, or relate to an existing one, the first time you sync.

3. Download and install iSync Palm Conduit for Palm HotSync.
4. Open HotSync Manager on your computer (find it in the Palm folder, which is probably in your Applications folder).
5. From the **HotSync** menu, choose **Conduit Settings**.
6. In the Conduit Settings window, double-click the iSync Conduit, then select the "Enable iSync for this Palm device" checkbox. This allows iSync to synchronize with your Palm Address Book, Date Book, and To Do information.
7. If you're using a Palm device that's localized for use with Japanese, select the "This is a Japanese Device" checkbox.
   Important: If you have a Japanese Palm OS device but do not select this checkbox, your information may become damaged or unusable.
8. Click OK, then quit HotSync.

The next time you open iSync, your Palm device should appear in the iSync window.

Syncing your device with iSync

To sync your Palm OS device with iSync, press the HotSync button on the Palm cradle, cable, or the device itself. Both HotSync and iSync should open during the synchronization.

Note: You *must* initiate the sync from the Palm device, or the device will be skipped during the iSync sync.

Tip: Some Sony Clié devices may require *Missing Sync*, a third-party application by Mark/Space, to work with HotSync. For more information, see the iSync Compatible Devices page.

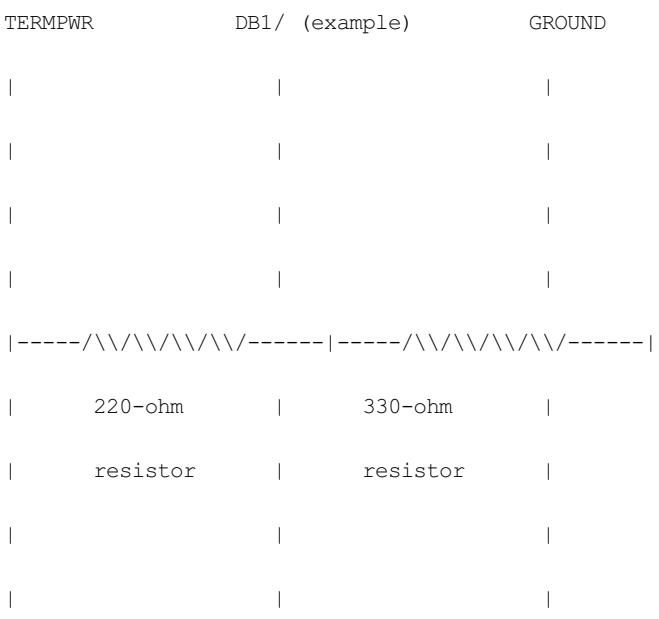
25-Pin SCSI Terminator: How To Build

This article contains information for constructing a 25-pin terminator
This article has been archived and is no longer updated by Apple.
Pinouts for the SCSI port are as follows:

Pin No.	Signal Name	Description
1	REQ/	Request
2	MSG/	Message
3	I/O/	Input/Output
4	RESET/	Reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GROUND	Signal Ground
8	DB0/	Data Bit 0
9	GROUND	Signal Ground
10	DB3/	Data Bit 3
11	DB5/	Data Bit 5
12	DB6/	Data Bit 6
13	DB7/	Data Bit 7
14	GROUND	Signal Ground
15	C/D/	Control/Data
16	GROUND	Signal Ground
17	ATN/	Attention
18	GROUND	Signal Ground
19	SEL/	Select
20	DBP/	Data Parity
21	DB1/	Data Bit 1
22	DB2/	Data Bit 2
23	DB4/	Data Bit 4
24	GROUND	Signal Ground
25	TERMPWR	+5 volts

Inside the Apple SCSI Terminator each signal line (ends with "/") is connected to TERMPWR through a 220-ohm resistor and is also connected to GROUND through a 330-ohm resistor.



The obvious tradeoff here is cost versus time to build this terminator. It would seem that size is also an issue; this is a lot of resistors and solder

joints to deal with.

However, if someone needs it, and appearance is not an issue and energy is in abundance, this is a solution.

Apple Discussions About QuickTime: Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding the Apple Discussions About QuickTime, in the Apple Discussions area at the Apple Support site. Each question is followed by one or more pointers to articles in the Knowledge Base, which provides answers, suggestions, or troubleshooting advice to help you deal with the issue.

If the questions below do not contain an answer to something you are looking for, you can continue to search for an answer by using the Search function here within the Knowledge Base or you can go to the **Apple Discussions About QuickTime** itself.

Take some time to look through the QuickTime discussion board, or use its search function. It is quite likely your question has come up before, even if it does not have the frequency of the ones listed below. If you find a previously posted question that matches yours, read the posted answers. If you still did not find an answer, please feel free to either post a new topic describing your issue, or add a reply to an existing topic that closely matches your issue.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. When using Netscape Navigator for Windows, I want the QuickTime 3 plug-in to open .MOV files, but prefer opening .MID, .WAV, and .AVI files using various other plug-ins.
2. I have installed QuickTime on my computer, and now I get a message saying "You may experience problems playing a video track in "xxxxxxxx.avi" because the required compressor could not be found."
3. I have installed QuickTime on my Windows-compatible computer and can no longer play movies. I have a broken QuickTime logo in Web pages.
4. I have installed QuickTime 3 on my computer, and now I am unable to save a movie that is shown in my web browser. Is there some way to do this?
5. How do I route QuickTime MIDI information to a MIDI sound module or MIDI keyboard? The QuickTime Settings control panel only lists choices for "QuickTime Music Synthesizer" and "(No Synthesizer)."
6. How do I add a new synthesizer configuration? How do I configure QuickTime to use my sound card for playing music and MIDI files, instead of using the QuickTime Music Synthiesizer?
7. While installing QuickTime. I get "An error occurred trying to download the file VISEData" or "The file "viseicat.idx" couldn't be downloaded."
8. When using my browser, I sometimes get the error message, "Could not load plug-in 'QuickTime' for the MIME type 'video/quicktime'".
9. Where can I get the QTVR Xtra 2.0 for Director?
10. Uninstalling QuickTime, I get an error message which says a file is in memory.

Question 1: When using Netscape Navigator for Windows, I want the QuickTime 3 plug-in to open .MOV files, but prefer opening .MID, .WAV, and .AVI files using various other plug-ins.

Answer: See article 30544: "**QuickTime 3 for Windows: Netscape Configuration Tips**"

Question 2: I have installed QuickTime on my computer, and now I get a message saying "You may experience problems playing a video track in "xxxxxxxx.avi" because the required compressor could not be found."

Answer: See article 30506: "**QuickTime : "Required compressor could not be found" Message**"

Question 3: I have installed QuickTime on my Windows-compatible computer and can no longer play movies. I have a broken QuickTime logo in Web pages.

Answer: See article 60884: **"Windows Internet Explorer 5.5 SP2 and 6.0: Broken QuickTime Graphic in Web Pages"**

Question 4: I have installed QuickTime 3 on my computer, and now I am unable to save a movie that is shown in my web browser. Is there some way to do this?

Answer: See article 30398: "**QuickTime 3: Saving From Plug-in**"

Question 5: How do I route QuickTime MIDI information to a MIDI sound module or MIDI keyboard? The QuickTime Settings control panel only lists choices for "QuickTime Music Synthesizer" and "(No Synthesizer)."

Answer: See article 22210: "**QuickTime 3: Routing MIDI Information**"

Question 6: How do I add a new synthesizer configuration? How do I configure Quicktime to use my sound card for playing music and MIDI files, instead of using the QuickTime Music Synthesizer?

Answer: See article 22210: "**QuickTime 3: Routing MIDI Information**"

Question 7: While installing QuickTime, I get "An error occurred trying to download the file VISEData" or "The file "viseicat.edx"couldn't be

downloaded".

Answer: See article 60388: "**QuickTime: "VISEData or "viseicat.idx" Alerts**"

Question 8: When using my browser, I sometimes get the error message, "Could not load plug-in 'QuickTime' for the MIME type 'video/quicktime'".

Answer: See article 21183: "**QuickTime For Windows: Frequently Asked Questions**"

Question 9: Where can I get the QTVR Xtra 2.0 for Director?

Answer: See article 24007: "**QTVR 1.0 to 2.0 Transition**"

Question 10: Uninstalling QuickTime, I get an error message which says a file is in memory.

Answer: To successfully remove QuickTime for Windows, whether you use the uninstall program or the Add/Remove Programs control panel, the Control Panels window needs to be closed. This is because both a QuickTime, and QuickTime 32 control panel is considered active by Windows, whenever the Control Panels window is open. Close the Control Panels window after opening the Add/Remove Programs control panel or before running the Uninstall QuickTime application.

Final Cut Pro: Recommendations for Good Performance

This document contains recommendations for good performance.

This article has been archived and is no longer updated by Apple.

Recommendations for good performance

Follow these recommendations to help Final Cut Pro work smoothly on your system.

- Don't use your computer as a server. Using your system as a server can impede Final Cut Pro's performance, causing dropped frames and other problems.
- Leave the Processor Performance setting in System Preferences at Highest.
- Don't use Final Cut Pro while connected to the Internet via modem.
- Turn off AppleTalk when capturing or outputting to tape. Turn off AppleTalk when you're using the Log and Capture window or when outputting your program to tape to prevent the possibility of dropped frames. For more information, see Mac Help.
- Limit your use of third-party extensions. Some users prefer to install Final Cut Pro on a system that doesn't have third-party extensions for anything other than video editing. However, depending on how your system is set up, you may need other extensions, such as drivers for USB-to-serial adapters, USB-to-ADB adapters, and printers and third-party video capture cards. Avoid installing extensions for increasing memory or performance, customizing your pointer, or modifying the behavior of your screen or desktop. If you need memory, buy and install more RAM. If you need faster performance, consider a faster computer. If you must install third-party extensions that may interfere with the smooth operation of Final Cut Pro, set up extension sets to use for various purposes. Use the Extensions Manager control panel to create a set of extensions for use with Final Cut Pro that excludes unnecessary third-party extensions. When you use Final Cut Pro, you can start up your computer with the appropriate set of extensions. For more information, see Mac Help.

This document contains information from Help Center, the help system included with your computer.

SCSI Troubleshooting: Hardware and Software Conflicts

A discussion of SCSI hardware and software conflicts and possible solutions.
This article has been archived and is no longer updated by Apple.
Connecting SCSI devices and installing associated drivers and INITs sometimes cause hardware and software issues.

Hardware issues

- Improper termination, typically the cause of hardware conflicts
- Not setting the SCSI priority number to a unique number
- Using a device that improperly "provides" built-in termination, or improperly powers the terminators.
- Damaged cables, terminators, or the terminator power source.
- Low system RAM. Configuring a startup disk with minimal drivers and INITs or adding more RAM may help in a low memory situation.

Software issues
Software conflicts typically result from INITs conflicting at startup. Often, you can isolate a conflicting INIT by removing all extraneous INITs, then systematically adding each one back into the System Folder, one at a time, until you can no longer start up or use a device.

Also, you can often eliminate the conflict by renaming the INIT (or files that contain INITs in their Resource Fork) so that they install in a different order. (INITs and drivers are installed alphabetically.) For example; you could rename the Apple Scanner INIT to "aScanner" to get it to load sooner.

Note: There are some INITs that won't work if renamed. If this is the case, and the INIT conflicts with some device, you may have to remove the INIT from the System Folder when using that device.

Cinema Tools: An Introduction to Cinema Tools for Final Cut Pro

This document is an overview of Cinema Tools for Final Cut Pro.

This article has been archived and is no longer updated by Apple.

An Introduction to Cinema Tools for Final Cut Pro

In today's post-production environment, it's common for editors and filmmakers to find themselves faced with a confounding array of formats, frame rates, and workflows encompassing a single project. Projects are often shot, edited, and output using completely different formats at each step. For editors and filmmakers who specifically want to shoot and finish on film or 24P high definition video, Cinema Tools for Final Cut Pro becomes an essential part of the post-production process when editing with Final Cut Pro, because it allows you to convert between different formats.

For example, when working with film you need to be able to track the relationship between the original film frames and their video counterparts. Cinema Tools includes a sophisticated database feature that tracks this relationship regardless of the video standard you use, ensuring that the film can be conformed to match your Final Cut Pro edits. Cinema Tools also provides tools that enhance Final Cut Pro's ability to edit video at a 24 frames per second (fps) rate, such as the import and export of 24 fps Edit Decision Lists (EDLs).

Also provided is the ability to convert captured video clips to 24 fps video. For NTSC, this includes a Reverse Telecine feature that removes the extra frames added during the 3:2 pull-down process commonly used when transferring film to video or when downconverting 24P video.

Cinema Tools works with Final Cut Pro to provide tools designed to make both editing film digitally and working with the emerging 24P high definition video standard easier and more cost effective, providing functionality previously found only on high-end or very specialized editing systems.

Editing Film Digitally

Computer technology is changing the film-creation process. Most feature-length films are now edited digitally, using sophisticated and expensive nonlinear editors designed for that specific purpose. Until recently, this sort of tool has not been available to filmmakers on a limited budget.

Cinema Tools provides Final Cut Pro with the functionality of systems costing many times more at a price that all filmmakers can afford. For filmmakers shooting with 35mm or 16mm film who want to edit digitally and finish on film, Cinema Tools allows you to edit video transfers from your film using Final Cut Pro, then generate an accurate cut list that can be used to finish the film.

How Does Cinema Tools Help You Edit Your Film?

Editing film has traditionally involved the cutting and splicing together of a film workprint, a process that is time consuming and tends to discourage experimenting with alternate scene versions. Transferring the film to video makes it possible to use a nonlinear editor (NLE) to edit your project. The flexible nature of an NLE makes it easy to put together each scene and gives you the ability to try different edits. The final edited video is generally not used-the edit decisions you make are the real goal. They provide the information needed to cut and splice (conform) the original camera negative into the final movie. The challenge is in matching the timecode of the video edits with the key numbers of the film negative so that a negative cutter can accurately create a film-based version of the edit.

This is where Cinema Tools comes in. Cinema Tools tracks the relationship between the original camera negative and the video transfer. Once you are finished editing with Final Cut Pro, you can use Cinema Tools to generate a cut list based on the edits you made. Armed with this list, a negative cutter can transform the original camera negative into the final film.

Film Is Not Going Away

For many, film still provides the optimum medium for capturing images, and if your goal is a theatrical release or a showing at a film festival, you will need to provide the final movie on film. Using Final Cut Pro with Cinema Tools does not change the process of exposing the film in the camera or projecting the final movie in a theater-it's the part in between that takes advantage of the advances in technology.

What Cinema Tools Does

Cinema Tools tracks all of the elements that go into the making of the final film. It knows the relationship between the original camera negative, the transferred videotapes, and the captured video clips on the editing computer. It works with Final Cut Pro to store information on how the video clips are being used and generates the cut list required to transform the original camera negative into the final edited movie.

Cinema Tools also checks for problems that can arise while using Final Cut Pro, the most common one being duplicate uses of source material: using a shot (or a portion of it) more than once. Besides creating duplicate lists, you can use Cinema Tools to generate other lists, such as one dealing with opticals-the placement of transitions, motion effects (video at other than normal speed), and titles.

Cinema Tools can also work with the production sound, tracking the relationship between the audio used by Final Cut Pro and the original production sound sources. It is possible to use the edited audio from Final Cut Pro when creating an Edit Decision List (EDL) and process (or finish) the audio at a specialized audio post-production facility.

It's important to understand that you use Final Cut Pro only to make the edit decisions- the final edited video output is not typically used, since the video it is edited from generally is highly compressed and includes burned-in timecode (window burn) and film information. It is the edit-based cut list that you can generate with Cinema Tools that is the goal.

Why 24P Video?

The proliferation of high definition video standards and the desire for worldwide distribution has created a demand for a video standard that can be easily converted to all other standards. Additionally, a standard that translates well to film, providing an easy, high-quality method of originating and editing on video and finishing on film, is needed.

The 24P video standard provides all this. It uses the same 24 fps rate as film, making it possible to take advantage of existing conversion schemes to create NTSC and PAL versions of your project. It uses a progressive scanning scheme and a high definition image (1920 pixels per line, 1080 lines per frame) to create an output well suited to being projected on large screens and converted to film.

Additionally, the 24P standard makes it possible to produce high-quality 24 fps telecine transfers from film. These are very useful when you intend to broadcast the final product in multiple standards.

Working With 24P Sources

With the emergence of high definition 24P video recorders, there is a growing need for Final Cut Pro to support several aspects of editing at 24 fps. Using Cinema Tools with Final Cut Pro provides the following:

- the import and export of 24 fps EDLs
- the ability to convert NTSC 30 fps EDLs to 24 fps EDLs
- a Reverse Telecine feature to undo the 3:2 pull-down used when 24 fps film or video is converted to NTSC's 30 fps

Editing 24P Video

The excellent quality of 24P video presents a challenge when it comes to editing-the bandwidth and storage space it requires. Editing uncompressed 24P video directly in Final Cut Pro requires you to have a system with large, fast drives and specialized capture hardware. Even with a properly configured system, you will only be able to capture the video you actually intend to use, not the typical 20 to 100 hours you may have shot.

The typical approach is to edit in two steps: an offline session, using compressed and downconverted (to NTSC or PAL) clips, followed by an online session with recaptured uncompressed clips.

Even if your Final Cut Pro system is not configured to edit uncompressed 24P video, it can serve as an offline editor and export a 24 fps EDL to be used by a 24P online editing system. Even better, if your online 24P editing system uses Final Cut Pro, you can simply copy the project from the offline system, allowing you to preserve far more information about the edit than an EDL alone can provide.

How to Install Cinema Tools for Final Cut Pro 3

This document describes how to install Cinema Tools for Final Cut Pro.

This article has been archived and is no longer updated by Apple.

Installing Cinema Tools for Final Cut Pro

Congratulations on your purchase of Cinema Tools for Final Cut Pro. The following information is intended to get you up and running as quickly as possible. Be sure to also read the "Before You Install" document (on the Cinema Tools for Final Cut Pro installation CD).

Using Cinema Tools With Final Cut Pro
Final Cut Pro version 3.0.2 for Mac OS X is the required companion product to Cinema Tools.
It is required for several Cinema Tools features:

- 24 frames per second (fps) Edit Decision List (EDL) Import and Export
- the direct export of film lists from an edited sequence

Installing Cinema Tools on Systems With Final Cut Pro
The Cinema Tools installation package contains plug-ins and Easy Setup files for Final Cut Pro. How these are handled during the installation depends on your situation:

- *If you are installing Cinema Tools on a system that already has Final Cut Pro 3.0.2 installed*, Final Cut Pro is configured to work with these files.
- *If you are installing Cinema Tools and Final Cut Pro at the same time*, install Final Cut Pro first. This ensures that Final Cut Pro will be properly configured to work with Cinema Tools.
- *If you install Final Cut Pro 3.0.2 sometime after you install Cinema Tools*, you will need to reinstall Cinema Tools to properly configure Final Cut Pro.

Installing Cinema Tools on systems with Final Cut Pro adds plug-ins and Easy Setups to Final Cut Pro. The plug-ins let you export film lists and audio EDLs, and provide 24 fps EDL Import and Export functionality. The Easy Setups support three DV configurations: 23.98 fps, 24 fps, and NTSC with non-drop frame timecode.

System Requirements
Before you install Cinema Tools, make sure that your system meets the minimum requirements.

Important Be sure your system also meets Final Cut Pro's needs when installing both applications, especially if you want to take advantage of Final Cut Pro's full feature set.

Hardware

- The following are the minimum recommended computer configurations:
- Power Macintosh G3/300 megahertz (MHz) or faster computer with built-in FireWire
- PowerBook G3/400 MHz or faster computer with built-in FireWire
- iMac 350 MHz or faster computer with built-in FireWire
- iBook (Dual USB) 500 MHz or faster computer with built-in FireWire

Your computer also needs the following:

- A CD or DVD drive
- 256 megabytes (MB) of random-access memory (RAM)
- 10 MB of disk space for the application
- If you will be storing media clips on the same computer, at least a 6 gigabyte (GB), Audio/Video rated disk drive (20 GB or greater recommended)

Software

- Mac OS X v10.1.3 or later
- QuickTime 5.0.4 or later (included with Mac OS X)
- Final Cut Pro 3.0.2 for Mac OS X is the required companion product to Cinema Tools.

Recommendations for Good Performance

TA25522_How_to_Install_Cinema_Tools_for_Final_Cut_Pro_.pdf

Follow these recommendations to help Cinema Tools work smoothly on your system.

- Don't use your computer as a server.
  Using your system as a server can impede the performance of Cinema Tools, causing dropped frames and other issues.
- Don't use Cinema Tools while connected to the Internet via a modem.

Installing and Registering Cinema Tools for Final Cut Pro
Note: Before you can install any software on computers with Mac OS X, you need to log in as the administrator using the administrator password.

1. Insert the Cinema Tools installation CD into your CD or DVD drive, then double-click the Cinema Tools Installer folder.
2. Double-click the Install Cinema Tools icon and follow the onscreen instructions.
Note: If multiple copies of Final Cut Pro 3.0.2 are detected, you will be asked to select the one to configure for Cinema Tools.
3. When a message appears stating that installation was successful, click Quit.
4. Double-click the Cinema Tools application icon to open Cinema Tools.
Important The Cinema Tools installation CD must be in the CD or DVD drive the first time you open Cinema Tools. It is no longer required after you have filled out the Registration dialog.
5. In the Cinema Tools Registration dialog, enter your first and last name.
Note: Entering a middle initial and organization is optional.
6. In the Serial Number field, enter the Cinema Tools serial number listed on the installation CD sleeve, then click OK.
Important The serial number is case-sensitive. Be sure to enter it exactly as shown on the label.

You are now ready to begin using Cinema Tools.

This document contains information from the Cinema Tools in-box materials and installation CD.

Note: Final Cut Pro 4 includes Cinema Tools 2. The Final Cut Pro 4 installer installs both programs.

DVD Studio Pro: About DVD Copy Protection

This document describes the two types of copy protection currently supported by DVD Studio Pro.
This article has been archived and is no longer updated by Apple.
DVD Studio Pro supports both analog and digital forms of copy protection. When using either form, the DVD Studio Pro project must be taken to an authoring facility so the copy protection can be enabled during the replication process.

Analog -- Macrovision

DVD Studio Pro supports 3 types of Macrovision copy protection

- Type 1 (Automatic Gain Control only)
- Type 2 (Automatic Gain Control + 2-line colorstripe)
- Type 3 (Automatic Gain Control + 4-line colorstripe)

In each case Macrovision copy protection prevents the user from making a copy of the video to a device such as a VCR or other recording device via an analog signal such as an S-Video connection.

To enable Macrovision:

1. Click on a video track tile in the Graphical View.
2. Choose the type of Macrovision copy protection you would like to enable in the Property Inspector. See Figure 1. Each track needs to be set independently.

Figure 1 Choosing Macrovision copy protection

Digital -- CSS

DVD Studio Pro supports CSS or Content Scrambling System. This system prevents your DVD-Video from being copied to a hard drive or other media. CSS scrambles the video signal in a way which makes copies unusable.

To enable CSS:

1. Click in the grey area of the Graphical View to deselect all tiles.
2. Choose On from the CSS pop-up menu in the General area of the Property Inspector. See Figure 2. This setting is applied to the whole disc as opposed to MacroVision which must be applied to each track.

Macintosh: Correct Way to Shut Down and Restart

Is it okay to shut down my Macintosh by switching off the power?
This article has been archived and is no longer updated by Apple.
The correct way to restart or shut down a Macintosh computer is to choose the Restart or Shut Down commands from the Special menu in the Finder. When the computer starts up, a flag is set on the startup disk to let the Mac OS know that the computer started up correctly. When the computer is restarted or shut down correctly this flag is cleared. If the computer was not restarted or shut down correctly this flag is not cleared, for example: the computer is turned off using the power switch, or reset using the reset button.

When a Macintosh computer starts up this flag is tested. If the flag is clear the computer starts up normally. If the flag is set, the Mac OS knows that the computer was not restarted or shut down correctly. In this case, the computer rebuilds the volume bitmap. On a large startup disk with many files, this operation may take several minutes. Depending on the version of Mac OS installed on the startup disk, Disk First Aid checks the hard disk and repairs any errors that are found.

Apple Hardware: Importance of Proper Grounding

This article discusses the importance of proper grounding for all Apple equipment.
This article has been archived and is no longer updated by Apple.
From a user safety standpoint, when using electrical equipment, it is important to have the accessible portions of the device at a voltage potential that does not endanger the user. When electrical devices are not grounded there is the possibility that a charge may build up, either from environmental conditions, or from the voltages inside. If all electrical devices in use at a particular location are properly grounded there is a reduced possibility of shock. Many governments require grounding on certain types of electrical equipment.

Aside from the safety aspects, improper grounding can affect the operational reliability of a computer system. If a computer system and its peripherals are not properly grounded then excessive ground currents may be generated, which may cause erratic operation. If all the equipment is connected to a common ground then the chances for issues caused by ground loop currents are reduced.

Apple Discussion About Power Macintosh Frequently Asked Questions

This article contains a number of frequently asked questions (FAQ) that have come up on the Apple Discussion About Power Macintosh in the Apple Discussion area at the Apple Support site. Each question is followed by one or more pointers to articles in the Apple Knowledge Base, which provide answers, suggestions, or troubleshooting advice to help you deal with the issue that creates the question.

Some of the answering articles have pointers to useful suggestions posted on the board by other users. These may or may not also have an official Apple answer, but this will be noted where applicable.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. I have a Power Macintosh G3 (Blue and White) computer. Are there any updates I need to install?
2. I have the Apple DVD-ROM and decoder card. I sometimes have difficulty playing movies. What can I do?
3. Does my computer support the master and slave IDE mode?
4. Audio CD-ROM discs appear to stop playing periodically. Why is this happening?
5. Sometimes the computer pauses for a few seconds before doing anything. It sounds like the CD-ROM drive is trying to start up when it happens. Is there anything I can do?
6. I have a Power Computing Corporation computer and I'm trying to get warranty support for it. Who do I contact for this?
7. I have an older Power Macintosh computer and the computer starts up, but I don't get any video. Sometimes if I turn it on and off it will work. What can I do?
8. My computer seems to freeze for no reason at all. What can I do to get it working or to find out what is causing the freeze?
9. I have a Power Macintosh G3 computer and I have difficulty using various sound applications.
10. I have a processor card I removed from a Power Macintosh 8600/250. Can I use that in my Power Macintosh 7600?
11. I purchased one of the build-to-order SCSI cards from Apple for my Power Macintosh G3 (Blue and White). I'm not sure which card I got or what I can connect to it.
12. I'm having difficulty with my Power Macintosh modem. Sometimes I can't connect at all or sometimes I get disconnected. Is there anything I can do?

Question 1: I have a Power Macintosh G3 (Blue and White) computer. Are there any updates I need to install?

Answer: Article 31002: "**Power Macintosh G3 (Blue and White): When to Install Available Updaters**"

Question 2: I have the Apple DVD-ROM and decoder card. I sometimes have difficulty playing movies. What can I do?

Answer:

- Article 58402: "**Power Macintosh G3: DVD Troubleshooting**"
- Article 58273:"**Power Macintosh G3 (Blue and White): Displaying DVD Video on Second Display**"

Question 3: Does my computer support the master and slave IDE mode?

Answer: Article 24342: "**Power Macintosh G3: IDE Master and Slave Support and Configuration**"

Question 4: Audio CD-ROM discs appear to stop playing periodically. Why is this happening?

Answer:

- Article 20287: "**Energy Saver: Causes CD-ROM Discs To Stop Playing**"

Question 5: Sometimes my Power Macintosh pauses for a few seconds before doing anything. It sounds like the CD-ROM drive is trying to start up when it happens. Is there anything I can do?

Answer: Article 30376: "**Power Macintosh: Pauses For Several Seconds**"

Question 6: I have a Power Computing Corporation computer and I'm trying to get warranty support for it. Who do I contact for this?

Answer: Article 24325: "**Power Computing Corporation: Support Information**"

Question 7: I have an older Power Macintosh computer and the computer starts up, but I don't get any video. Sometimes if I turn it on and off it will work. What can I do?

Answer:

- Article 20328: "**Macintosh Computers: Low Battery Can Cause No Video**"
- Article 11751: "**Macintosh Family: Batteries & Part Numbers**"

Question 8: My computer seems to freeze for no reason at all. What can I do to get it working or to find out what is causing the freeze?

Answer:

- Article 19468: "**Macintosh Computers & System 7.5: Freeze Troubleshooting**"
- The **Basic Troubleshooting** area of Tech Exchange may also help in troubleshooting this type of issue.

Question 9: I have a Power Macintosh G3 computer and I have difficulty using various sound applications.

Answer:

- Article 22146: "**Power Macintosh G3 Sound Input Settings**"
- Article 24290: "**Power Macintosh G3: No Internal Modem Sound**"
- Article 30517: "**AudioTuneUp 2.0 Update: Read Me**"
- Article 30307: "**Power Macintosh G3: Using PlainTalk Speech Recognition v1.5**"

Question 10: I have a processor card I removed from a Power Macintosh 8600/250. Can I use that in my Power Macintosh 7600?

Answer: Article 24801: **"Power Macintosh 8600, 9600: Processor Card Compatibility**"

Question 11: I purchased one of the build-to-order SCSI cards from Apple for my Power Macintosh G3 (Blue and White). I'm not sure which card I got or what I can connect to it.

Answer:

- Article 58204: **"Power Macintosh G3 (Blue and White): SCSI FAQ"**
- Article 58256: **"Power Macintosh G3 (Blue and White): Differentiating Between Available SCSI Cards"**

Question 12: I'm having difficulty with my modem. Sometimes I can't connect at all or sometimes I get disconnected. Is there anything I can do?

Answer:

- Article 30893: "**Remote Access: Modem Not Responding Alert**"
- Article 24803: "**Troubleshooting Unreliable Modem Connections**"

Final Cut Pro 3: Issues With Audio Quality

This document describes problems with audio quality that may occur with Final Cut Pro 3.

This article has been archived and is no longer updated by Apple.

You don't hear audio through your camcorder speakers.

- Make sure your cables are properly connected.
- If you are scrubbing audio in the Audio tab of the Viewer, increase the volume of the computer's audio output.

You don't hear audio on your computer's speakers when playing video from your camcorder or deck.

- Make sure the speaker's cables are properly connected.
- Make sure your audio cables are properly connected.
- If you're monitoring your audio from your computer, make sure that Mute is off, and that the computer's volume is adjusted to a reasonable level.
- When external video is set to all frames in order to monitor video using a camcorder, deck, or third-party capture card, both the video and audio are played through the external monitor and speakers that are connected to your camcorder, deck, or third-party capture card. The computer's speakers don't receive any audio. Make sure the external monitor and speakers are both on and make sure the speaker's volume level is turned up.
- Check your QuickTime audio settings in the Capture Presets tab in the Audio/Video Settings window. For details on audio sample and source settings, see About capture presets.

Captured audio sounds distorted and "crackly" during capture.

- During capture, make sure that you always set Final Cut Pro's sample rate to that of your recorded source material. Mismatched sample rates can result in pops and crackles in the audio, incorrect audio/video sync, and in generally diminished sound quality. These rates are
    - 32 kHz if you're capturing media from a DV camera that was set to 12-bit recording
    - 44.1 kHz if you're using your microphone input or other audio interface
    - 48 kHz if you're recording from a DV camera set to 16-bit recording, or if you're recording from an audio interface capable of this rate.

Captured audio sounds fine during capture and when played in the Viewer, but when you edit it into a sequence along with other audio clips, it sounds distorted.

- Make sure that the sample rates of the audio clips you're using match the sample rate set for your sequence. If they don't, Final Cut Pro will resample your audio during playback. Mixing 44.1 kHz audio and 48 kHz audio sounds acceptable, but audio will sound best with the audio rate of your edited sequence set to 48 kHz. Upsampling audio in Final Cut Pro sounds better than downsampling it.
  It's not recommended you mix 32 kHz audio (12-bit) and 48 kHz audio (16-bit) in the same sequence, as this may result in slight audio distortion.

Macintosh: Foreign File Access Error Message

I received this message when starting a Macintosh with an attached CD-ROM drive:

"No File System Access Modules could be found in your System Folder. Therefore, the Foreign File Access Software was not installed."

Can you explain?
This article has been archived and is no longer updated by Apple.
You get this message when you have the Foreign File Access extension in your System Folder, but one or more of the access files are not installed.

In order to use the CD-ROM drive that came with your Macintosh computer, you need the following files in your extension folder; Apple CD/DVD Driver (or just Apple CD-ROM depending on the version of Mac OS you have installed); High Sierra File Access; Foreign File Access; ISO 9660 File Access; UDF Volume Access; and Audio CD Access.

If any of these files are moved or turned off using the Extension Manager, the Foreign File Access extension is not be able to locate them and displays the error message "No File System Access Modules could be found in your System Folder. Therefore, the Foreign File Access Software was not installed."

Mac OS X: Kodak Photo CD Capabilities

Kodak Photo CDs work differently in Mac OS 9 and Mac OS X. Additional steps or third-party software may be necessary to open pictures on the CDs.
This article has been archived and is no longer updated by Apple.

Symptom

- The Kodak Photo CD appears on the desktop or in a Finder window, but the contents of the CD-ROM disc do not appear the same in Mac OS X as they do in Mac OS 9.
- Application programs that can open Photo CD files under Mac OS 9 cannot open them under Classic or Mac OS X.

Note: This document discusses Kodak Photo CD discs. Kodak Picture CD discs are different and can be used the same under Mac OS 9 and Mac OS X.

Solution

Option 1

Note: This option only works with iPhoto 1.1.1 or later.

1. Insert the Photo CD disc into the computer.
2. iPhoto should automatically start. If it does not, then launch iPhoto.
3. iPhoto should change to Import mode and the Photo CD should appear in the bottom left (Figure 1)

Figure 1 Photo CD icon

4. Click the Import button to import the photos from the Photo CD (Figure 2). Erasing after import is not an option because the CD is read only.
5. When the import is complete, eject the Photo CD.

Figure 2 Import button

Note: iPhoto imports Photo CD images at the highest resolution available on the disc (most commonly 3072x2048).

Option 2

1. Choose System Preferences from the Apple menu.
2. Choose Startup Disk from the View menu. The Startup Disk pane appears.
3. Click the Mac OS 9 System Folder to select it.
4. Click Restart, then Save and Restart when prompted. The computer restarts using Mac OS 9.
5. Insert the Photo CD.
6. Open the Photos folder Note: This folder does not appear in the Mac OS X Finder (Figure 3).

Figure 3 Photo CD window

7. Locate the picture size (resolution) you want to use and copy the entire folder or selected pictures within that folder to the desktop (Figure 4). Note that each folder contains the same pictures represented at different resolutions or sizes.

Figure 4 Resolution options

8. Open the Startup Disk control panel.
9. Select the Mac OS X System folder, and click Restart.
10. Locate the images in the Mac OS 9 Desktop Folder and open them in program of your choice.

Option 3

Note: This options works with Adobe Photoshop 6.0 or later running under Classic, or Graphic Converter 4.1.2 or later running under Mac OS X.

1. Insert the Kodak Photo CD.
2. Open Adobe Photoshop or Graphic Converter.
3. Choose Open from the File menu.
4. Navigate to the Photo CD and select the Images folder.
5. Click Open.
6. Select the picture you wish to open then click Open.

Other applications may be able to open the Kodak Photo CD ".PCD" file formats. Check with the application vendor or documentation for compatibility information.

Notes

1. See technical document 61215 "**Mac OS X: How to Open and Save Files on the Mac OS 9 Desktop**" if Mac OS X and Mac OS 9 are installed on the same volume.

QuickTime Pro: About Types of QuickTime Tracks

This article has been archived and is no longer updated by Apple.

This document discusses the different types of track elements that can be in a QuickTime Movie.

Each element of a QuickTime movie is contained in a separate track. You make a QuickTime movie by adding tracks that point to the media you want to use. The media may be embedded in the movie itself, or reside on a server half a world away. This track architecture is powerful and flexible, providing you with the control and precision you need to create complex interactive movies.

Each track represents a unique aspect or ability that you can change over time. A single movie may have many different track types, including video, audio, text, sprite, Flash, HREF, hinting, QuickTime VR, and chapter divisions. Each track, in turn, may possess many modifiable properties.

Sample QuickTime movie properties

Track	Description
Movie Track	Contains movie title, description, copyright information, and other general information on the entire movie.
Video Track	Digitized video, rendered 3D animation, or any other compiled image sequence, with optional special effects.
Audio Track	CD-quality audio or other audio formats. For more information, go here.
Music Track	MIDI music with QuickTime instruments
Timecode Track	Contains the control information that allows QuickTime to interpret media samples within a movie. For more information, go here.
Quartz Composer Track	Used to create motion graphics animation based on OpenGL, Core Image, and Core Video technologies. These animations are called "Quartz Composer compositions" and are stored in ".qtz" files. For more information, go here.
Text Track	Text imported into QuickTime for titles, subtitles, credits, notes, and other uses. For more information, go here
Chapter Track	A type of text track that divides and index the movie into sections. For more information, go here.
HREF Track	Text track containing interactive or automatic URL lines. For more information, go here.

Sprite Track	Contains one or more small images with animatable, programmable behaviors; useful for signs, symbols, games, and effects. For more information, go here.
3D Track	Contains 3DMF (QuickDraw 3D metafile) objects.
Flash Track	Incorporates Adobe Flash (.swf) animation. For more information, go here.
QTVR or VR object track	QuickTime VR information for object movies.
QTVR panorama track	QuickTime VR information for panorama movies.
Streaming Track	Contains a reference to a live stream or a movie on a streaming server. For more information, go here.
Hint Track	Contains information that allows a streaming server to deliver a media track as a real-time stream. For more information, go here.

QuickTime Pro: About Audio and Video Tracks

This document discusses audio and video tracks and compression options that can be used with each using QuickTime Pro.

This article has been archived and is no longer updated by Apple.

Video and audio tracks are the most common forms of QuickTime media tracks. Chances are you'll spend most of your time working with them.

Video tracks:
A QuickTime video track can be created from:

- Digital video (DV).
- Digitized analog video.
- A 2D or 3D animation program.
- Any other source capable of generating an image sequence in any of the many file formats importable into QuickTime.

Movies can have many video tracks, and the tracks can be edited, layered, and have effects and transitions applied to them. You have complete control over such properties as frame size, frame rate (frames per second), data rate, and video compression.

Video compression:
Video compression is necessary to make your movies play at full speed on most computers or to be small enough to view on the web. QuickTime supports a wide range of codecs (compressors-decompressors), both lossless (high quality, large files) and lossy (lower quality, small files).
To see your codec options:

1. Choose Export from the File menu.
2. Choose 'Movie to QuickTime Movie' from the Export pop-up menu.
3. Click Options
4. Click Settings under Video. The first pop-up menu under Compressor lists the codec options.

The Apple Sorenson codec is recommended as a high-quality lossy codec for video and rendered animation.

Special effects, transitions, and filters:
QuickTime includes fifteen video filters for such visual effects as blur, edge detection, emboss, film noise, HSL balance, RGB balance, and sharpen; thirteen basic video transitions, including cross-fade, explode, gradient wipe, implode, push, slide, and wipe, each with several variations, and ripple, fire, clouds, and glass effects. These are applied through the Fitlers Option to the selected range of frames. The QuickTime Effects Architecture is fully open and extensible, so that you can write your own filters.

Audio tracks:
A QuickTime audio track contains digitized sound samples. These can be an MP3, an audio CD track or sampled analog tape recording, or from any other audio source that can generate a sound file compatible with QuickTime (and most are). Audio quality ranges from high (16-bit, 44.1 kilohertz, uncompressed) to low (8-bit, 22 kilohertz, highly compressed). As with video tracks, you can edit audio tracks and layer one audio track on top of another to build a complex audio experience.

Music tracks:
QuickTime also supports a separate audio track type called a music track. This is actually a MIDI (Musical Instruments Digital Interface) track that contains, not digitized audio, but note information played with a virtual instrument. QuickTime includes its own selection of high-quality MIDI instruments. MIDI delivers long and complex pieces of music using small files and little bandwidth.

Audio compression:
QuickTime offers a variety of sound and music compressors. QDesign's Music Codec is recommended for its high quality and small-size files.

QuickTime Pro: How to Make Picture-in-Picture

This document describes how to create the picture-in-picture effect in QuickTime Player with QuickTime Pro.
This article has been archived and is no longer updated by Apple.

You must have QuickTime Pro to work with movie tracks. To learn how to upgrade, see the QuickTime website.

Use the Movie Properties of QuickTime Player to inspect and change many video track properties, such as movie size and graphics mode. A basic compositing trick is to add a small picture-in-picture video to the corner of your movie. This requires two video tracks.

1. Open Movie 1, the one in which you will insert the smaller picture-in-picture video.
2. Import picture-in-picture movie:
    - If the picture-in-picture video is in a separate movie (Movie 2), open Movie 2, select the frames that will become the picture in picture, and copy them.
    - If the picture-in-picture video is in Movie 1, extract the video track. This will create a new movie with that video as the sole media track. Select the frames that will become the picture in picture, and copy them.
3. In Movie 1, select the frames where you want the picture-in-picture to appear.
4. Choose Add Scaled from the Edit menu to paste the picture-in-picture video onto the selected area of Movie 1. This adds a second video track to Movie 1.
5. To make the picture-in-picture video track smaller while keeping the same aspect ratio, choose Show Movie Properties from the Window menu, select Video Track 2, and modify the Size property from the right-hand Properties pop-up. Choose Select All, then Shift-drag one of the red corner handles

QuickTime Pro: Capabilities of Sprite Tracks

This document discusses some of the capabilities of sprite tracks in a QuickTime movie using QuickTime Pro.

This article has been archived and is no longer updated by Apple.

Sprites are animations in which an image, a short image sequence, or a video clip is moved around in the frame along a vector path by the computer. Think of Pac-Man or the little critters in any older videogame and you've got the basic idea of a sprite (although sprites can be a lot more sophisticated than that). All you do as the sprite creator is create the image (such as a logo), specify the movement path (a spin motion, for example), and add other behaviors (play a logo sound) attached to it. The computer does the rest. The first frame of the animation contains the image data; the subsequent frames contain only a reference to the image and the behavior and new x and y coordinates where the image will be displayed. All the calculations are done on the viewer's computer, making sprites a very efficient, low-bandwidth way to create movement.

A sprite track in QuickTime contains sprite animation that you create in an authoring program such as LiveStage or LiveStage Pro, Adobe's GoLive, or Electrifier Pro, and then import into QuickTime. Sprites have several important properties:

- Sprites can change position, scale, and rotation according to values inserted into a transformation matrix.
- Sprites are automatically cropped as they cross the edges of the frame.
- Multiple sprites can exist in a sprite track, and they can pass in front of or behind each other (and change their depth order in the course of the movie)
- The source for a sprite can be a single bitmap, a bitmap image sequence, a vector image, a video track, a live stream, or even a source specified by an URL.
- All these properties, and others, can be combined, and modified as the movie plays, enabling the creation of very complex images and behaviors at virtually no cost in bandwidth.

Modifier and Tween Tracks

Importing a sprite to make a sprite track is just the beginning, however. QuickTime contains an invisible media type called a modifier track. The modifier track contains data that are used only to modify other tracks. Any media type, such as a video track, can be modified with an appropriate modifier track.

One use for a modifier track is to contain a series of coordinate numbers that change the position of a sprite. The most common way to do this is to use a type of modifier track called a tween track. The tween track generates a series of values from a specified starting point to a specified ending point over a given duration. For example, using a tween track, you can specify the movement of a sprite using just three sets of numbers: start position, end position, and duration. The tween track interpolates between the coordinates of the beginning and ending positions and automatically feeds the sprite a smoothly incrementing series of positions for the duration of the movement. The tween track always generates as many in-between values as possible, and the animation plays at the maximum frame rate the host computer can support, so the faster the host computer, the smoother the animation.

A tween track can generate many types of sprite data, such as:

- Position in the transformation matrix
- Layer depth
- Image source
- Index

Three tween tracks can send a sprite tumbling across the frame, in front of or behind other tweens, and load a repeating sequence of images for the sprite as it goes.

You can also apply tween tracks to other movie or track properties. For example, using LiveStage Pro you can fade video in and out by setting the blend value of a video track.

Actions and Events

The actions of a sprite can be driven by system events such as mouse actions or keystrokes. So you can use sprites to design custom movie controllers that your audience can click on. Another thing sprites can do is check their own position coordinates, layer number, and index, and change their behavior according to criteria you define. For example, a sprite can look to see if it reaches the edge of the frame and execute a "bounce" movement when it does. A sprite can also modify its behavior with the passage of time, either "movie" time (the duration in which the movie plays) or in real time. In fact, a sprite can continue to act even after the movie it is in is paused or stopped

QuickTime: About QuickTime VR

This document discusses the capabilities of QuickTime VR.
This article has been archived and is no longer updated by Apple.

QuickTime VR creates an immersive, photorealistic experience simulating actual or imagined three-dimensional objects and places. Unlike other virtual reality implementations, QuickTime VR does not require special goggles or gloves, and it doesn't need you to download a custom 3D plug-in to work with any application or web browser. All major applications that play QuickTime movies can also play QuickTime VR movies. There are two main types of QuickTime VR movies - QuickTime VR Panoramas and QuickTime VR Object Movies.

QuickTime VR Panoramas

QuickTime VR panoramas create the experience of standing in a space and looking in all directions--360 degrees side-to-side, even 120 degrees overhead and underfoot--with the view panning smoothly wherever you look. Panoramas are ideal for educational websites, architectural walkthroughs, real estate listings, and photoreal gaming environments.

A QuickTime VR panorama is actually a carefully calibrated series of photographs or 3D graphics images, stitched and blended together with QuickTime VR authoring software and mapped onto the inside of a virtual cylinder. You see part of the projection through the QuickTime VR window; you scroll to see other parts using the mouse.

QuickTime VR panoramas can be linked to create large immersive environments accessible from a series of viewpoints, or nodes. A linked series of nodes is called a multinode panorama. You move from node to node--from viewpoint to viewpoint--by clicking on hotspots (up to 255 per panorama). Authoring applications--such as Apple's QuickTime VR Authoring Studio--contain tools for embedding navigational controls and markers right in the environment, making it easy for your audience to find its way around.

QuickTime VR Object Movies

QuickTime VR object movies depict objects that can be "handled"--turned, tilted, and spun--so you can see them from every angle. Object movies are great for displaying retail items on the web or for allowing virtual manipulation and study of artworks, scientific and medical models, product parts, and other real objects.

Object movies are created by photographing or rendering a series of views of the object at carefully spaced angles of tilt and rotation and assembling the view images into a movie. Each view of the object doesn't have to be a still image; it can also be a video clip or animation. For example, the front view of a car could show the hood opening to reveal the engine.

Hotspots can also link to URLs or media files or even to QuickTime VR object movies, so that objects seen in panoramas can be picked up and handled.

QuickTime: About Streaming Movies

This document discusses the streaming process including advantages of streaming and types of streaming.

This article has been archived and is no longer updated by Apple.

Streaming is the process of sending media over a network for viewing in real time. Streams can originate from a live source, such as a video camera, a webcast, or an audio feed from a radio station, or the source can be a QuickTime movie stored on the server. In either case, you aren't downloading a file when you stream a movie. The data is simply being displayed as it arrives by the QuickTime plug-in and in QuickTime Player; no copy remains on the viewer's hard disk.

With true live events, the stream functions more or less as the web version of a TV or radio broadcast; users can turn it on or off and switch to another channel. When you are streaming a completed movie stored on a hard disk (sort of a video-on-demand arrangement), your audience has random access to the entire stream and can jump anywhere within it. Preparing media for streaming.

Streaming is accomplished within Mac OS X Server using QuickTime Streaming Server. You cannot run QuickTime Streaming Server from any version of Mac OS 9 or earlier.

Advantages of streaming.

There are many advantages to direct streaming, as opposed to simply posting a movie to your web site and having people download it.

Instant play
With streaming, people can see your media play right away--there are no lengthy downloads.

Live events
Streaming is the only way to distribute live events such as news coverage and sporting events over the web. More on live streaming.

Long-form media
Streaming media are not limited to file sizes that make a reasonable download. Long-form media such as feature films and concerts that would make multi-gigabyte downloads can stream effortlessly.

Multicasting
Many viewers can tune into one stream--a process called multicasting.

Random access
Viewers can pause, fast forward, or otherwise interact with prerecorded movies and play only the parts they want. (This is where chapter tracks really come into their own.)

Distribution control
Streaming allows you to maintain control over the distribution and copyright of your media. Anyone can download a movie, alter it, and redistribute it themselves, but it's much harder to redistribute the contents of a stream. When your audience saves your streaming movie, all it is saving is the URL of the stream and some user settings. The actual data is never copied.

- Streaming Types
  QuickTime currently supports several types of streaming.
- Unicast streams are simple one-to-one streams, like a phone call from the server to a single client computer. To reach many clients, the server must send many streams, which is a less efficient use of bandwidth. However, each viewer of a unicast stream can randomly access the movie, playing only the parts they want to see. Typically, unicast is used to stream prerecorded movies.
- Multicast streams are sent directly to a group address, such an IP multicast address, which in turn can be simultaneously accessed by many client computers. The viewer of a multicast has no control over what is presented. Multicasts are an efficient way to deliver the same material to a group of people over a LAN, as only one copy of the stream is sent over the network.
- Reflected multicast streams take live media from another source, such as a radio or TV broadcast, and stream it out to viewers as a series of unicasts. This is the approach taken by online news networks, such as CNN.com. Take a look at QuickTime TV for examples of live reflected multicast streams.

You can view streamed media by:

- Tuning in directly to a live or prerecorded broadcast using QuickTime Player
- Using QuickTime Player to view multimedia on demand
- Using a web browser to point to a web page that has streamed media embedded in the page

QuickTime Pro: AppleScripts for Mac OS 10.1

This document lists and describes the scripts available from the AppleScript Web site for use with QuickTime 5 using Mac OS 10.1 or later and QuickTime Pro.
This article has been archived and is no longer updated by Apple.
QuickTime 5.0.2 offers dramatically increased AppleScript support in the QuickTime Player application. The QuickTime Player scripting dictionary contains exciting new commands and properties which can be used to automate many movie-editing and playback tasks performed by novices and professionals alike.

This collection of example scripts contains a variety of useful scripting tools, including script applets, droplets, and compiled scripts for use with the Script menu. These are briefly described below. All scripts are fully editable and many have properties whose values can be easily changed.

NOTE:

- These scripts are designed to work only with QuickTime 5.0.2. on Mac OS X 10.1 using QuickTime Pro. Many of the scripts will not work with earlier versions of QuickTime, including QuickTime 4.1.
- These scripts are not compatible with Mac OS X 10.0 - 10.0.4.

For more information concerning QuickTime Player scripting and AppleScript, visit the AppleScript website at:
(http://www.apple.com/applescript/)

Download the scripts from Apple Developer site

- **Applets-Droplets - (41 scripts)**

  Applets are AppleScript scripts saved as small self-running applications. Double-click them to start them as you would with any other application.

  Droplets are special AppleScript applications which respond to files and folders dragged onto their icon. All of the following droplets can be used to process or play QuickTime files. Each droplet will process the individual dragged-on files or folders containing files and sub-folders containing more files, which have been dragged onto its icon.

  Each droplet has properties or parameters which can be set by double-clicking the droplet and clicking the "Set Prefs" button in the main dialog.

  The following is a brief description of each applet or droplet and instructions for its use:

- **Add to Favorites** · Drag QuickTime files or folders of QuickTime files onto this droplet to have each file added to your favorites list.
- **All Annotations Droplet** · This droplet can be used to set the value of all or some of the available annotations for QuickTime files. If an annotation does not exist, the script will create it.

  To access the preferences dialog and set the value for specific annotations, double-click the droplet, and then click the "Set Prefs" button in the main dialog window.

  The following are the names of the available annotations: "Album", "Artist", "Author", "Comment", "Copyright", "Creation Date", "Description", "Director", "Disclaimer", "Full Name", "Host Computer", "Information", "Make", "Model", "Original Format", "Original Source", "Performers", "Producer", "Product", "Software", "Special Playback Requirements", "Warning", "Writer"

- **Annotations & Credits Droplet** · This droplet functions in the same manner as the Limited Annotations Droplet. In addition to setting the annotations of dragged-on movie files, it will also create scrolling credits based on the annotations and place them at the start of the movie.
- **Change to PictureViewer File** · Drag image files or folders of image files onto this droplet to change the creator type of every image file to "ogle", which is the creator code for the PictureViewer application.
- **Clear All Annotations Droplet** · This droplet will remove annotations from dragged-on movie files. Double-click the droplet to access the preferences for determining whether to retain the existing movie title.
- **Convert to DV Stream** · This droplet will convert movie files to DV format which can then be imported into iMovie. The original file will be replaced by the newly created file.
- **Convert to QuickTime Format** · This droplet will open files saved in supported formats and save them as QuickTime files with a file type of MooV and a creator type of TVOD. The original file will be replaced by the new file.
- **Create Slideshow From Folder** · Drag a folder of images onto this droplet to create a slideshow movie file. Options include: making the file self-presenting and self-closing, auto display of images (movie mode) or manual advancing (slideshow mode), seconds per image or images per second, and saving the file as a proxy linked to the images or as self-contained.
- **Display Folder as Slideshow** · Similar to the "Create Slideshow From Folder" droplet except there is no completion action and no file is saved. Great for a quick perusal of images.

- **Limited Annotations Droplet** · This droplet can be used to set the value of a small number of annotations for QuickTime files. If an annotation does not exist, the script will create it.

  To use, enter the name of the annotation in the comment field of the droplet followed by a colon and then the value for the indicated annotation. The comment field is in the Finder information window of the droplet (select the droplet and type command-I). Each paragraph in the comment field will be considered to be a separate annotation. For example:
  Copyright:Â©2000 Your Company
  Product:Your Video Product
  Author:Ordinary User
  Performers:Me, Myself, and I

  See the description of the "All Annotations Droplet" for a list of supported annotations.
- **Play Movies** · This droplet will play dropped-on movies in sequential order. Double-click the droplet to access the playback preferences.
- **Prep Camera Images for Web** · This droplet can be used to resize digital camera images and convert them to JPEG format for use on the Internet. Double-click the droplet to set the preferences for image width and height.
- **Present Movies** · This droplet will present dropped-on movies in sequential order. Double-click the droplet to access the playback preferences which include presentation size, looping, continuation query dialogs, and movie volume.
- **Present Neighbor Movies** · this script applet, when launched, will present any movie files which are located in the same folder as the droplet.
- **Sample Audio CD** · This applet will extract a sample of an indicated duration from each track of an audio CD and compress the result using a chosen QT compressor setting.
- **Save As Un-Editable** · This droplet will save a movie file so that it cannot be edited or saved. After setting the saveable property to false, the original movie file is exported as a self-contained movie. The original file is deleted, so use this droplet only on copies.
- **Save Copy as DV Stream** · This droplet will save copies movie files to DV format which can then be imported into iMovie.
- **Save Copy as Hinted** · This droplet will open files in QuickTime formats and export a copy to a indicated folder as hinted QuickTime files of file type of MooV and a creator type of TVOD. Double-click the droplet to access the hint settings preferences.
- **Save Copy in QT Format** · Same as the "Convert to QuickTime Format" droplet except the original file is not replaced and the user is prompted to locate a folder which will contain the duplicate files.
- **Send & Play Remote Movie** · When a single movie file is dragged onto this droplet, this script is designed to:

  1. Turn on file sharing on a specified remote computer
  2. File share the startup disk from the remote computer over TCP/IP
  3. Find/create a folder named "Movies" on the root level of the mounted volume
  4. Copy the movie file into the "Movies" folder replacing any existing copies
  5. unmount the shared volume and turn off file sharing on the remote computer
  6. Instruct the remote computer to play the newly copied movie file

  Complete instructions for setup and execution of this script are detailed in AppleScript Guidebook Module for Program Linking Over IP, available on the AppleScript Website: http://www.apple.com/macosx/features/applescript/l
- **Set Controller Type** · This droplet set the type of controller displayed for the movie. Double-click the droplet to access the preferences for controller type.
- **Set HREF Property** · Using this droplet you can assign a URL to a movie so that when the movie is clicked, another webpage or movie is opened. This property overrides any HREF's assigned to tracks within the movie.

  To set the target file or page to load within the same window as the linked movie, use this format for the URL:
  <file URL relative to this movie>T<myself> For example: <media/nextmovie.mov>T<myself>
- **Media Skin Droplet** · This droplet can be used to automate the creation of QuickTime movies which have custom media skin interfaces. This powerful script makes the multi-step process a breeze.
- **Streams Sampler** · This droplet can be used to monitor multiple streams. To use, drag a text file containing a return-delimited list of target stream URLs onto the droplet. The script will then perform the following steps:

  1. The droplet will read the text file, and direct the QT Player to connect to the first stream in the list
  2. Once connected, the script will save a frame from the stream every 10 seconds for three times.
  3. The stream will then be closed and the next stream in the list accessed.
  4. Once a "snapshot" has been taken of all the streams, the script will open each saved frame and resize it to indicated dimensions.
  5. Once all the images have been resized, the script will create an HTML file showing the images and the source link.
  6. The created HTML file will then be opened in the default browser set in the Internet Control Panel.

  Double-click the droplet to set the default dimensions to be used for the resized images, and the number of seconds between frame captures.
  Playback Properties Droplets

  QuickTime 5.0 has added support for special playback properties which control the manner in which a QuickTime file is played in the QuickTime Player. In addition to the existing "auto play" property, QT 5.0 now supports: quit when done, auto quit when done, close when done, auto close when done, and auto present. These properties are not accessible through the QuickTime Player interface and can only be set via AppleScript scripts.

- **Disable Presentation Mode** · This droplet sets the auto present property of dragged-on movies to false.
- **Display Playback Properties** · This droplet will display a dialog showing the current status of all the playback properties of a movie file.
- **Reset Playback Properties** · The droplet will set the status of the playback properties to either false or their default value.
- **Save As Presentation File** · This droplet will set the playback properties so that a movie file will self-present and close or quit when completed. Double-click the droplet to set the preferences for presentation size, display mode (movie or slideshow), and the completion action (none, auto close, auto quit).
- **Set Auto Close Property** · This droplet will save movie files so that they automatically close when finished playing.
- **Set Auto Play Property** · This droplet will save movie files so that they automatically play when opened.
- **Set Auto Quit Property** · This droplet will save movie files so that the QuickTime Player will automatically quit when the movie has finished playing.

Script Menu Scripts - (100 scripts)

The following scripts are installed in the Scripts folder in the System folder and are accessible via the OSA Script Menu. If you don't have the OSA Menu extension installed, the OSA Menu Lite 1.2.2 installer is included with the QuickTime scripts.

These scripts are meant to be copied, edited, and adapted for your requirements.

The following is a brief description of each script and instructions for its use:

Annotations

- **Set Name of Front Movie** · This script will allow the user to set the Full Name annotation of the front movie.

Chapters
Finally, an easy way to create and edit chapter tracks!

- **Add Chapter at Current Time** · This script will add a chapter at the current time of the front movie.
- **Chapter Summary** · This script displays a list containing the name, start, and duration of every chapter of the front movie.
- **Create Chapter Track** · This script will crate a chapter track for the front movie. Use the "Add Chapter at Current Time" script to add individual chapters once this script has created the chapter track.
- **Create Chapter Track From File** · Use this script to create a chapter track from an imported text file.
- **Delete Chapter** · Use this script to delete a chapter from the chapter track of the front movie.
- **Get Chapter Info** · This script will display all the information about a chosen chapter.
- **Play a Chosen Chapter** · Like the name says, this script will play a chapter selected from a list of chapters of the front movie.
- **Re-Name Chapter** · Use this script to change the name of an existing chapter in the front movie.

Edit
QuickTime 5.0 has added support for the QuickTime Player Pro editing commands: cut, copy, paste, trim, add, and add scaled.

- **Copy Selection to New Movie** · This script will copy the current selection from the front movie, open a new movie and paste the selection on the clipboard into the new movie.
- **Cut 1 Second Forward** · This script will cut the selection from the current play point of the front movie to one second ahead.
- **Cut from Beginning** · This script will select from the beginning of the front movie to the current play point and then cut that selection.
- **Cut Selection to New Movie** · This script will cut the current selection from the front movie, open a new movie and paste the selection on the clipboard into the new movie.
- **Cut to End** · This script will select from the current play point in the front movie to the end and then cut that selection.
- **Edit Frame in GraphicConverter** · This script will open the current frame in the GraphicConverter application from **Lemke Software**. Version 4.0 of this powerful image editing application has increased AppleScript support.
- **Merge Movie 1 into Movie 2** · This script will add a copy of the front movie to the movie behind it.
- **Scale Front Movie to x%** · This script will proportionally scale the front movie to the user supplied percentage.
- **Select from Beginning** · This script will select from the beginning of the front movie to the current play point.
- **Select to End** · This script will select from the current play point in the front movie to the end of the movie.
- **Select X Seconds** · This script will prompt the user for the number of seconds to select from the current play point of the front movie. It will then select the requested number of seconds from the current play point.
- **Set Dimensions of Front Movie** · This script will prompt for a width and height to be applied to the front movie and will scale it accordingly.
- **Start Movie 2 with Movie 1** · This script will place a copy of the front movie at the start of the movie behind it.
- **Zero Out Selection** · This script will set the select points of the front movie to 0.

Export

- **Export to DV Stream** · This script will export the front movie in DV format which can then be imported into iMovie.
- **Preview Frame w/2 Settings** · This script can be used to preview an export with any two QuickTime export settings. When run, the script will prompt the user to choose two export settings from the list of built-in standard settings. Next, it will prompt to locate a folder in which it can place the export temp files. The script will then extract the current frame and export a copy with each of the chosen settings applied. The script will then generate a SMIL file which will be opened to display the result side-by-side in a new movie window.
- **Save Current Frame as BMP** · This script saves the current frame on disk as BMP image.
- **Save Current Frame as JPEG** · This script saves the current frame on disk as JPEG image.
- **Save Current Frame as PICT** · This script saves the current frame on disk as PICT image.

Favorites

- **Create HTML Favs Summary** · This script will create an HTML page containing the name of every favorite and its URL. The page will be automatically opened in the default browser set in the Internet Control Panel.
- **Delete Specific Favorite(s)** · This allows the user to delete user-defined favorites chosen from a list of favorites.
- **Go To Favorite** · This script will present a list of all favorites by name from which the user can pick the one to be accessed.
- **List Favorite URLs** · This script will present a list of all favorites by URL from which the user can pick the one to be accessed.
- **Save Favorites Info** · This script will create a text file containing the name and URL of every favorite.

HTML

- **EMBED Tag Wizard** · This script will prompt the user to answer a series of questions in order to create the appropriate EMBED tag for displaying a QuickTime movie in a webpage. The derived HTML tags will be placed on the clipboard or written to a file on disk.

Info

- **Info for Front Movie** · This script will present a dialog containing information about the front movie including: natural dimensions, length, seconds elapsed, seconds remaining, file size, creation date, modification date, and creator code. There is an optional button which when pressed, will reveal the front movie file in the desktop.
- **QuickTime Settings** · This script will present a dialog containing information about the version of QuickTime installed, the current connection speed settings, and whether QuickTime Pro has been activated. There is an optional button which when pressed, will open the QuickTime Control Panel.
- **Source URLS of Front Movie** · This script will display a dialog showing the source URL of the current streaming movie. There is an optional button to place the URL on the clipboard.
- **Timecode of Front Movie** · This script will present the current timecode of the front movie in a dialog. There is an option to copy the timecode to the clipboard.

Misc

- **Create Thumbnail Link Movie** · This script will automate the process of creating a link movie placed in a webpage which when clicked will open another movie in the QuickTime player.

  When run the script prompts for either the width or height of the desired thumbnail movie. Once the desired dimensions have been entered by the user, the script will copy the current frame into a new movie and scale the image to the requested dimensions. The script will then generate the HTML embed tag for the thumbnail movie based on the new movie file and the front movie.
- **Place Text on Clipboard** · This script will present a dialog in which the user can enter text which will be placed on the clipboard.
- **Revert Front Movie** · This will close the front movie without saving any changes and reopen it into a new window.
- **Set Controller** · This script will prompt the user to choose a controller type from a displayed list of controller types.
- **Set Sound Volume** · This script will allow the user to set the volume of the front movie. A setting of 0 to 255 is in the normal range. A setting of 256 to 384 sets the sound to overdrive.

Navigation

- **Move to End of Front Movie** · This script will set the current play point to the end of the front movie.
- **Move to X in Front Movie** · This script will prompt the user to indicate a point in the movie and then will set the current play point to the indicated number. The time of the current play point is indicated as the default text in the input field.
- **Reset Front Movie** · This script will move the current play point of the front movie to the beginning. It will also set the selection pointers to 0.
- **Rewind Front Movie** · This script will move the current play point of the front movie to the beginning.

Play

- **Play Front Movie at X% Speed** · This script will prompt the user for a speed percentage at which to play the front movie. For example, an answer of 150 will play the front movie at one and one half the normal rate -- normal being expressed as 100.
- **Play Front Movie from Start** · This script will play the front movie from its beginning.
- **Step Thru Front Movie** · This script will move incrementally through the front movie with one second delays between each movement.
- **Present Front Movie** · This script will present the front movie at full screen.

Preview

The Preview of a movie is the small movie snippet displayed at the left of the open dialog when a movie file is accessed by using the "Open Movie in New Player" command in the QuickTime Player.

- **Play Preview** · This script will play the section of the front movie currently set as its preview.
- **Set Preview to Selection** · This script will assign the current selection of the front movie as its preview.

Properties

- **01-Playback Properties** · This script will present a dialog summary of the status of the playback properties of the front movie.
- **02-Auto Play** · This script will allow the user to set the value of the auto play property to true or false.
- **03-Close When Done** · This script will allow the user to set the value of the close when done property to true or false.
- **04-Auto Close When Done** · This script will allow the user to set the value of the auto close when done property to true or false.
- **05-Quit When Done** · This script will allow the user to set the value of the quit when done property to true or false.
- **06-Auto Quit When Done** · This script will allow the user to set the value of the auto quit when done property to true or false.
- **07-Auto Present** · This dialog will allow the user to set the value of the auto present property to true or false.
- **08-Presentation Mode** · This script will allow the user to set the value of the presentation mode property to either movie mode or slideshow mode.
- **09-Presentation Size** · This script will allow the user to set the value of the presentation size property to normal, double, half-size, or full screen.
- **10-Reset Playback Properties** · This script will set the value of the playback properties to false or their default values.
- **HREF of Front Movie** · Using this script, you can assign a URL to a movie so that when the movie is clicked, another webpage or movie is opened. This property overrides any HREF's assigned to tracks within the movie.

  To set the target file or page to load within the same window as the linked movie, use this format for the URL:
  <file URL relative to this movie>T<myself> For example: <media/nextmovie.mov>T<myself>
- **Path to Front Movie** · This script will display a dialog containing the path to the front movie file. There is an optional button to have the file displayed in the Finder.

SMIL

SMIL stands for Synchronized Multimedia Integration Language (pronounced "smile") and is an XML-based language developed by the World Wide Web Consortium as a way to standardize the control and display of media content. Support for SMIL was introduced in QuickTime 4.1 and has been enhanced in 5.0.

- **Image Overlay with Link** · This script will create a SMIL file which places an image over part of a background movie. For example, you can have a company logo display at the bottom right of a movie. When the overlay image is clicked, a new webpage will open displaying a target URL.
- **Movie Caption w/ Link & Slider** · This script will create a SMIL file which displays static text along the bottom of a movie.
- **Movie Caption with Link** · This script will create a SMIL file which displays static text along the bottom of a movie. Clicking the text will open a specific webpage or movie.
- **SMIL Sequence Wizard** · This script will create reference movies which play sequences of QuickTime movies composed of files or remote streams. The user answers a series of questions and the script generates the appropriate SMIL QuickTime movie.
- **SMIL Slideshow w/ Bckgnd Audio** · This script will create a SMIL slideshow with background audio. Run the script and select a folder containing JPEG, GIF, or PICT images and an audio file to be played in the background. NOTE: saving the audio file as a QuickTIme movie will ensure that it plays smoothly.

Text Tracks

- **Annotations to Rolling Credits** · this is a description of this script
- **HREF for Web Movie End** · This script will prompt the user for a target URL to assign to the end of the front movie. Successive dialogs will determine whether to navigate to the assigned URL automatically or by user click, and whether to do so in a new window or the current window.
- **HREF for Web Movie Selection** · This script will prompt the user for a target URL to assign to the selected area of the front movie. Successive dialogs will determine whether to navigate to the assigned URL automatically or by user click, and whether to do so in a new window or the current window.
- **Rolling Credits for Front Movie** · This script will create rolling credits for the front movie based on the Full Name annotation, entered or imported credits, and prompted copyright information. The new credits will be a newly created movie. You can import credits from a text

file with each paragraph considered a new credit.

Tracks

Undoubtably THE most powerful new feature of the QuickTime Player's enhanced scripting abilities is its support for the control of tracks.

- **Create Static Text Track** · This script will prompt the user to input text into a dialog. The text will then be imported into the front movie as a new text track. Next the script will provide the ability to position the text track anywhere in the front movie window by entering its {x,y} coordinates.

  Place QuickTime text tags in the input text for styling or to create links. For example, {HREF}http://www.apple.com{endHREF} will be displayed in the new text track as a clickable hyperlink.
- **Delete All Disabled Tracks** · This script will delete any disabled tracks within the front movie. Note that some tracks, such as chapter tracks, are disabled intentionally.
- **Export Text Track(s)** · This script will export the text to disk from text tracks chosen from a list of the text tracks contained in the front movie.
- **Extract All Tracks** · This script will extract every track from the front movie into individual movies.
- **Import & Position Image Track** · This script can be used to import and position images into the front movie. Great for adding a logo or button.
- **Rename Track(s)** · This script allows the user to rename any tracks contained in the front movie.
- **Set Dimensions of Track(s)** · This script will allow the user to resize any visible track contained in the front movie.
- **Set HREF of Track(s)** · Visible tracks can have URL's assigned to them so that when they are clicked by the user, another webpage or movie is opened. This script will allow the user to assign URL's to any visible track contained in the front movie.
- **Set Layer of Track(s)** · This script allows the user to set the layer of track(s) of the front movie.
- **Set Operation Color of Track(s)** · The operation color of track determines which color will be effected by the transfer mode property. For example, a white areas of a track could be set to become transparent. This script allows the user to set the operation color of track(s) to either black, white, or gray.
- **Set Position of Track(s)** · This script allows the user to position any visible track within the movie window area by entering the {x,y} coordinates of the top left of the track.
- **Set Start Time of Track(s)** · This allows for the setting of the start time of a track(s). For example, a track can be set to begin at 3 seconds of the beginning of a movie.
- **Set Transfer Mode of Track(s)** · This script allows the user to set the transfer mode of track(s). Blending and transparency are two example settings.
- **Tracks Info** · This script wills post a dialog summary of the values of various properties of chosen tracks.

Window

- **Set Position of Front Movie** · This script can be used to set the position of the front movie within the screen.

QuickTime Pro: SMIL Extensions

This document lists and describes the SMIL extensions available with QuickTime Pro.

This article has been archived and is no longer updated by Apple.

SMIL is an extensible standard, and QuickTime provides several SMIL extensions. This allows you to add QuickTime specific attributes to your SMIL presentation. See technical document 42651 "**QuickTime Pro: About SMIL"** for additional information.

To use QuickTime extensions in your SMIL document, include the xmlns: parameter and the URL of the QuickTime extensions as part of the initial <smil> tag like this:
<smil xmlns:qt="http://www.apple.com/quicktime/resources/smilextensions">

QuickTime does not actually access the URL; it is used only to uniquely identify the QuickTime SMIL extensions.

In the examples that follow, the xmlns: parameter and the URL shown above have been omitted for readability, but they are a required part of the <smil> tag when any QuickTime extensions are used in a SMIL presentation.

autoplay

Specifies whether the presentation should play automatically. Legal values are true or false. The default is false.

Example:
```
<smil qt:autoplay="true">
```

bitrate

Specifies the bandwidth a media object needs in order to play back in real time. This is used to give QuickTime enough information to decide how far in advance to begin loading a media element to provide seamless playback. Possible values are positive integers, in bits per second.

Example:
```
<video src="stream56k.mov" qt:bitrate="56000" />
```

Note: Do not confuse qt:bitrate with system-bitrate. Use system-bitrate to select a media element based on the user's connection speed. Use qt:bitrate to help QuickTime determine when to start downloading a media element.

chapter

Specifies a chapter name for a media element. Valid values are any character string. Use this to create named points in your presentation that the viewer can jump to interactively. The chapter names appear as a pop-up list in the controller. This allows you to add a QuickTime chapter list to a SMIL presentation.

Example:
```
<seq>
<video src="Intro.mov" region="r1" qt:chapter="Introduction"/>
<video src="Chap1.mov" region="r1" qt:chapter="Overview" />
<video src="Chap2.mov" region="r1" qt:chapter="Under the Hood" />
</seq>
```

In the example above, the movie controller would have a pop-up menu with three choices: Introduction, Overview, and Under the Hood. The viewer could jump to the corresponding point in the SMIL presentation at any time.

chapter-mode

Specifies whether the Time slider represents the duration of the whole presentation or the duration of the current chapter. Legal values are all and clip. Specify all for the whole presentation, clip for chapter-at-a-time.

For Example:
```
<smil qt:chapter-mode="clip"/>
```

composite-mode

Specifies the graphics mode of a media element. This is used to create partial or complete transparency. The composite-mode attribute goes in any

of the media element tags: video, img, or animation. Possible modes are

- copy
- none
- direct.

These modes all specify no transparency, which is the default for most image formats.

Example:
```
<img qt:composit-mode="copy"/>
```

- blend;percent

Specifies a blend between the image and the background, with a required percent integer value specifying the blend weight<0% means complete transparency, 100% complete opacity.

Example:
```
<video qt:composite-mode="blend;50%"/>
```

- transparent-color;color

Specifies that all pixels of a particular color within the image should be treated as transparent. It accepts a second parameter, color, that specifies the color to be rendered as transparent. The color parameter may be any valid color specification supported by Cascading Style Sheets, level 2.

Example:
```
<animation qt:composite-mode="transparent-color;black"/>
```

- alpha
- straight-alpha
- premultiplied-white-alpha
- premultiplied-black-alpha

Specify that the image has an internal alpha channel that should be used when compositing. The alpha and straight-alpha modes refer to a separate alpha component; the premultiplied modes refer to an image that has been premultiplied with the alpha against a white or black background, respectively.

Example:
```
<video qt:composite-mode="straight-alpha;50%"/>
```

- straight-alpha-blend;percent

Specifies that the image has an internal alpha channel as a separate component, and that an additional level of transparency should be applied to the whole image.

Example:
```
<img qt:composite-mode="straight-alpha-blend;50%"/>
```

immediate-instantiation

When used in the <smil> tag, specifies whether all the media elements in the presentation should be downloaded (or streamed) immediately, or whether this should be deferred until each element is about to be played. Legal values are true and false. Default is false. Opening all the media elements at the beginning of the presentation can take considerable time and memory, so we recommend that it be done only for simple presentations with a few small media elements.
When used in an element tag, specifies that this particular element should be downloaded or streamed as soon as the presentation is opened. You might use this to preload an element to be sure it is already in memory when it needs to play.

Example: `<smil qt:immediate-instantiation="true">`
Example 2: `<img src="bgimg.png" qt:immediate-instantiation="true"/>`
Example 3: `<video src="bgimg.png" qt:immediate-instantiation="true"/>`
Example 4: `<text src="bgimg.png" qt:immediate-instantiation="true"/>`
Example 5: `<audio src="bgimg.png" qt:immediate-instantiation="true"/>`
Example 6: `<animation src="bgimg.png" qt:immediate-instantiation="true"/>`

next

Specifies a presentation to play when this presentation finishes. Legal value is the URL of something QuickTime can play: a media file, a movie, a stream, or a SMIL presentation. This is similar to the QuickTime plug-in's QTNEXT parameter.

Example: `<smil qt:next="nextpresentation.smi>`

system-mime-type-supported

Specifies the MIME type that needs to be supported in order to play a media element. This is normally used in conjunction with the <switch> tag to allow the player software to choose a media element that it can handle. Possible values are character strings matching a valid MIME type.

Example:

```
<switch>
<img src="qt.mov
" qt:system-mime-type-supported="video/quicktime"/><img src="someotherformat.suffix" qt:system-mime-type-supported= "other/mime-type"/>
</switch>
```

target

Specifies a target for a presentation specified by the href parameter in the anchor tag. Possible targets are an existing browser window, a browser frame, or quicktimeplayer. If the target string is none of these, a new browser window is created. Used in conjunction with show="new".

For example:

```
<a href="http://www.server.com/another.smi" show="new" qt:target="quicktimeplayer">
<img src="OpenNewSMIL.gif" region="r2" dur="5:00" />
```

time-slider

Specifies whether the movie controller should include a Time slider. During a SMIL presentation, QuickTime dynamically loads media elements as required, so the known duration of the overall presentation can change as a movie is played or navigated. When the known duration changes, the scale of the Time slider changes to reflect that. This can be confusing to the viewer. Because of this, QuickTime movies created from SMIL documents do not normally display a Time slider. Legal values are true and false. Default is false.

Note: If you want to import a SMIL presentation into QuickTime and edit it using QuickTime Players editing features to add a chapter list for example you must set time-slider="true". QuickTime Player©^s editing features rely on the Time slider.
For example: <smil qt:time-slider="true">

QuickTime Pro: About Fast-Start Movies

This document discusses the fast-start capability of QuickTime Pro as one method to deliver QuickTime movies over the Web.

This article has been archived and is no longer updated by Apple.

With QuickTime, you can watch movies as they download using ordinary HTTP or FTP transfer protocols. This is not streaming, but a unique feature of QuickTime called fast-start or progressive download.

With fast-start, your audience downloads an entire QuickTime movie at the highest data rate their connections can support. As soon as the initial part of the movie has been downloaded, QuickTime Plug-in begins to play it back in the browser while it continues to download the rest. Your audience is left with a complete movie file that they can save and replay as often as they want. No special streaming software on the server is needed; all you have to do is create a fast-start movie (which you can do using QuickTime Player) and embed it in a Web page.

See technical document 42562 "**QuickTime Pro: How to Save a Fast-Start Movie**" for steps on how to create a fast-start movie using QuickTime Player.

A fast-start movie can start playing long before the whole file has downloaded--typically within a few seconds of starting the file transfer. If the Internet connection is faster than the movie's data rate, the movie plays smoothly as it arrives, with no waiting. It's an optimal experience for the audience.

A fast-start movie can also include pointers to data located in other files on the Web server, a local disk or CD, or any Web URL

Remote Access: Modem Script Basics

This document details conventions used in creating or modifying a modem script for use with Remote Access under Mac OS 9 or Internet Connect under Mac OS X.

This article has been archived and is no longer updated by Apple.

This document explains the conventions your Apple Remote Access modem script must follow and describes the basic tasks it must perform. For detailed descriptions of the modem scripting commands, see technical document 42658 "CCL Command Glossary."

What is a modem script? A modem script is a set of instructions that tells a computer how to interact with a modem so that calls can be initiated and received. To establish a connection, a script typically configures and then connects the modem. To terminate a connection, the script disconnects the modem by hanging up and then restores the modem settings that were in effect before the call. Each type of modem used with Apple Remote Access or Internet Connect requires a modem script. Many scripts are provided with the software (see the Modem control panel or the Modem tab in the Network pane in System Preferences). If no script is provided for your modem, you must write or modify one using Communication Command Language (CCL), a programming language that configures and controls your modem. Existing scripts can be edited in most text editors. For Mac OS 9 and earlier the file type may need to be changed after modifying the document. The file type is "mlts" and can be changed with many disk utilities including ResEdit. This document describes the basic elements and structure of a CCL file.

Script conventions

The following sections describe CCL script conventions for

- Instructions
- Comments
- Capitalization
- Labels
- Script resources
- String formats
- Variable strings (varStrings)
- Match strings
- Script size

Instructions
Each line of CCL code consists of one instruction that is made up of a command and its parameters, if any. Modem commands are used as parameters of CCL commands. For example, the command `write "ATDT^1\\13"` includes the following:
`write` -a CCL command
`ATDT` -a modem command
`^1\\13` -a modem command parameter

This command tells the CCL interpreter to send to the modem the modem command ATDT followed by variable string 1, and a carriage return (ASCII code 13). The CCL interpreter reads scripts from left to right and from top to bottom. It reads straight through, from beginning to end, unless you tell it otherwise (for example, by using the JUMP command).

Comments
You can insert explanatory comments into your script. To enter a comment, start the line with an exclamation point (!).

```
!  This is a sample comment and would be ignored by the script.
!
```

You may also want to use a blank comment line to make your script more readable; to do so, type an exclamation point with no text and press Return.

Capitalization
The CCL interpreter is not case-sensitive. Therefore,

```
@LABEL 1
@Label 1
@label 1
@laBel 1
```

are all valid instructions.

Labels
Labels are used to mark locations in the script. Other script commands, such as JUMP, transfer control to locations in the script marked by the @LABEL command. For instance, JUMP 13 tells the CCL interpreter to jump to label 13 and start executing the commands after the @LABEL 13 command. A script may use up to 128 labels, numbered 1 to 128.

Script resources
A modem script may contain an optional mlts resource with resource ID 0. This resource contains data that tells the CCL interpreter the characteristics of the modem. An mlts resource contains five unsigned bytes indicating the modem's error correction and command string limitations.

Byte 1 Indicates the modem's error correction capability:

0 The modem has no built-in error correction.
1 The modem has at least one embedded standard error correction protocol, such as MNP or LAPM. (Do not set to this value if the modem has only proprietary protocols such as PEP or HST.)

Byte 2 Reserved by Apple.

Byte 3 Indicates the maximum length of the first dial string fragment (in varString7; for details, see "Variable Strings (varStrings)" later in this chapter) passed to the script by the CCL interpreter. Check your modem documentation to determine the maximum number of characters your modem can accept in an AT command.

Byte 4 Indicates the maximum length of the second dial string fragment (in varString8) passed to the script by the CCL interpreter.

Byte 5 Indicates the maximum length of the third dial string fragment (in varString9) passed to the script by the CCL interpreter. If your script has no mlts resource (for example, if it is an Apple Remote Access 1.0 script), the CCL interpreter assumes a maximum length of 30 characters for each of the dial string fragments, and it assumes that the modem cannot negotiate a reliable link.

To create a script resource, follow the instructions in 42661 "**How to Create an "mlts" Resource.**"

String formats
To delimit a string in CCL code, you can use single quotation marks (') or double quotation marks ("). If you do not start the string with a single or double quotation mark, any of the following characters determines the end of the string: space, return, tab, comma, or semicolon.

CCL strings may include references to variable strings (varStrings). See "Variable Strings (varStrings)" later in this document for details.

CCL strings may include nonprinting characters such as null, tab, and return. To specify one of these characters in a string, precede it by an escape character. The CCL interpreter recognizes two escape characters: the backslash (\\) and the caret (^).

The backslash is used to include a character by specifying the decimal representation of the ASCII character (decimal numbers 00 to 99 are valid), or to include the backslash or caret character in a string.

The caret is used to insert a variable string or an ASK string into another string. (For details, see "Variable Strings (varStrings)" later in this document.) Here are some examples of how the backslash and caret are used:

`\\13` inserts a carriage return (0x0D) into the string
`\\00` inserts the null character (0x00) into the string
`\\\\` inserts the backslash (\\) character (0x5C) into the string
`\\^` inserts the caret (^) character (0x5E) into the string
`^1` inserts variable string 1 into the string
`^*` inserts the ASK string into the string

Here are some string examples:
`'this is a test'` yields `this is a test`
`thisisatest` yields `thisisatest`
`"this is a test"` yields `this is a test`
`this is a test` yields `this`
`"this \\34\\73\\83\\34 a test"` yields `this "IS" a test`

If variable string 1 is 555-1212, then
`"ATDT^1"` yields `ATDT555-1212`

Variable strings (varStrings)
CCL strings may include references to variable strings (varStrings), which are strings passed to the script as parameters. VarStrings 1- 4 and 6 are defined by Remote Access or the Network panel VarStrings 7-9 are defined by the CCL interpreter based on varString1 and bytes 3-5 of the mlts resource. VarString5 is reserved for future use by Apple.

Apple Remote Access uses the following varStrings:

varString1 the complete dial string (the telephone number to dial, with the necessary prefixes and suffixes)

varString2 the modem speaker flag 0 speaker off 1 speaker on

varString3 the tone/pulse dialing selector T tone dialing P pulse dialing

varString4 the modem error correction flag 0 script should not try to use modem error correction 1 script should try to use modem error correction 2 script should try to establish MNP10 error correction

varString6 the dialing mode flag 0 normal dialing 1 blind dialing (that is, have the modem begin dialing without confirmation of dial tone detection) 2 manual dialing (that is, have the script assume that the user has already picked up the phone and dialed the remote number)

varStrings7-9 varStrings 7-9 break a long dial string into shorter strings for use with modems that can accept only a limited command string size. They are automatically generated by Apple Remote Access. varString7 contains the first characters of varString1. Its maximum length is defined by byte 3 of the mlts resource (see "Script Resources" earlier in this document). If varString7 contains all the characters included in varString1, varString8 contains a blank string (ASCII 20 hex). If varString1 includes more characters than can be contained in varString7, varString8 contains some or all of the additional characters. Its maximum length is defined by byte 4 of the mlts resource. If varString7 and varString8 contain all the characters included in varString1, varString9 contains a blank string. If varString1 includes more characters than can be contained in varString7 and varString8, varString9 contains some or all of the additional characters. Its maximum length is defined by byte 5 of the mlts resource. Note: If you do not create an mlts resource for your script (as described in "Creating an mlts Resource" in the Apple Remote Access Modem WorkShop User's Guide), the CCL interpreter assumes a maximum length of 30 characters for each of the dial string fragments.

All eight varStrings are passed to the script when it is running in originate mode. The modem speaker flag (varString2) and the error correction flag (varString4) are passed to the script when it is running in answer mode.

Match strings
The CCL interpreter has a buffer that can hold up to 32 strings loaded by the MATCHSTR command. The MATCHCLR command erases the contents of the buffer. The MATCHREAD command reads input from the serial driver and compares the input to the strings currently in the buffer. If a match is found in the specified time, execution continues at the label associated with that match string. A recommended strategy for sending commands to the modem is as follows:

- Use MATCHCLR to clear all match strings.
- Use MATCHSTR to load match strings with appropriate responses.
- Use WRITE to send commands to the modem.
- Use MATCHREAD to check for defined modem responses. If an appropriate response is received, branch as defined by the corresponding MATCHSTR command.
- Use SETTRIES, INCTRIES, and IFTRIES to loop a few times.
- If an appropriate response is not received, branch to exit or to alternate code as defined by the MATCHREAD command.

Script size
Scripts used in Modem WorkShop may be a maximum of 30 kilobytes. (You can write quite a detailed script in 30 kilobytes.) If your script is too large, you may be able to make it small enough by minimizing the number and length of comments.

Tasks your script must perform
A modem script executes in one of three possible modes, each with a separate entry point. The modes are as follows:
originate used when a call is initiated
answer used when call answering is enabled
hangup used to terminate every connection, whether in originate or answer mode, and whether or not the connection was successful

Figure 1 below provides an overview of the tasks your script must perform in each mode. The remainder of this document describes these tasks.

Figure 1 Script tasks for each mode

Initiating a call
When you signal the Apple Remote Access program to initiate a call, it plays the script starting at the @ORIGINATE entry point. The script must perform the following tasks to initiate a call:

1. Configure your computer's serial port. Use the SERRESET command to reset the serial port's communication parameters. Set the speed of the connection to the maximum speed of the modem. (You may change the serial port speed later in the script.) Set the number of bits to be used for stop, start, and parity. Use the HSRESET command to turn off the serial port's flow control options. (You will turn on the appropriate options later in the script.)

2. Configure the modem. Following is a list of standard steps for configuring a modem. Check the documentation that came with your modem to determine whether it requires different steps.
    1. Recall the factory default configuration settings.
    2. If your modem has a speed of 14,400 bit/s or higher, you need to set up the modem for CTS/RTS handshaking and an appropriate cable must be used, as described in technical document 42660 "Remote Access: Cable Requirements." Do not turn on hardware handshaking until the connection has been made.
    3. Configure the modem for DTR usage.
    4. Turn local echo off. When local echo is on, the modem sends commands it receives back to the computer.
    5. Set the modem to return detailed result codes including the speed of the connection and the results of error correction and data compression negotiation.
    6. If the modem can do error correction, set error correction according to varString4. If varString4 is set to 0, turn error correction off. If varString4 is set to 1, have the modem negotiate the best available error correction with the remote modem. If no error correction can be established, have the modems remain connected without error correction. If varString4 is set to 2, have the modem try to establish MNP10 error correction with the remote modem. If MNP10 negotiation fails, have the modems remain connected without error correction. **Note:** If the modem uses a proprietary error correction protocol, make sure that it will try to negotiate standard protocols if it is unable to negotiate the proprietary protocol. If not, disable error correction. Note: Do not disable Trellis error protocol, which is part of the V.32 standard.
    7. Apple Remote Access is generally more efficient than a modem at compressing data. If you believe you have a special situation in which modem data compression is preferable, have the script set up the modem to negotiate data compression.
    8. Turn the modem speaker on or off according to the value of varString2.

3. Dial the phone number.

    1. Have the script check whether the dial string extends into varString8 (then varString9) by using the IFSTR command to check for a blank string. If the entire dial string fits in varString7, have the script issue a single dial command. If the dial string is longer than varString7, have the script issue multiple modem dial commands referencing varStrings 7 and 8, and if necessary, varString9.

    2. Set tone or pulse dialing in the modem dial command according to the value of varString3.

    3. If varString6 is set to 1, have the modem begin dialing without confirmation of dial tone detection. This is useful when the phone system provides a nonstandard dial tone that can't be recognized by the modem's tone detection circuitry. If varString6 is set to 2, the user will already have dialed the remote number. Have the script cause the modem to retrain with the remote modem. This is useful when the dialing sequence is too complex or interactive for the modem script to navigate.

    4. Display the dialed phone number in the Apple Remote Access Status window and the Activity Log. Use varString1 in log messages rather than a concatenation of varStrings 7-9.

4. Wait for the modem response.

5. If the call fails, return an error result code indicating what happened. For example, use error result code -6022 if the line is busy. (See technical document 42659 "Remote Access: CCL Result Code Listing," for a complete list.)

6. If the call is successful, indicate that a connection has been established. Display a message such as "Communicating at 9600 bit/s" in the Apple Remote Access Status window. Also display messages indicating the results of error correction and data compression negotiation, if applicable. If you were successful in establishing modem error correction, issue USERHOOK 4 (for MNP10 error correction) or USERHOOK 2 (for all other error correction) to advise Apple Remote Access that a reliable link was established. If you were successful in establishing data compression, issue USERHOOK 3 to advise Apple Remote Access to turn off its built-in data compression.

7. Configure the serial port based on the modem speed and the connection. If your modem has a speed of 14,400 bit/s or higher and if you are

using a CTS/RTS handshaking cable (see technical document 42660 "Remote Access: Cable Requirements"), use the HSRESET command to set flow control for outputCTS. Use the COMMUNICATINGAT command to tell Apple Remote Access the connection speed so that it can set its timers appropriately. If your modem has a speed of 9600 bit/s or slower, use the SERRESET command to reset the serial port speed to the speed of the connection.

8. Exit the script so that the Apple Remote Access program can continue with its internal execution.

Answering a call

To answer a call, the Apple Remote Access program plays the script starting at the @ANSWER entry point. The script must perform the following tasks to answer a call:

1. Configure your computer's serial port. Use the SERRESET command to reset the serial port's communication parameters. Set the speed of the connection to the maximum speed of the modem. (You may change the serial port speed later in the script.) Set the number of bits to be used for stop, start, and parity. Use the HSRESET command to turn off the serial port's flow control options. (You will turn on the appropriate options later in the script.)
2. Configure the modem. It will require several modem commands to completely configure the modem. To prevent calls being answered before the configuration is complete, disable auto-answering in the first modem command the script issues. (You will enable it in step 3.) For additional details about configuring the modem, see step 2 of "Initiating a Call" earlier in this document.
    1. Recall the factory default configuration settings.
    2. If your modem has a speed of 14,400 bit/s or higher, set up the modem for CTS/RTS handshaking and use an appropriate cable, as described in technical document 42660 "Remote Access: Cable Requirements"
    3. Configure the modem for DTR usage.
    4. Turn local echo off.
    5. Set the modem to return detailed result codes including the speed of the connection and the results of error correction and data compression negotiation.
    6. If the modem can do error correction, set error correction according to varString4.
    7. Apple Remote Access is generally more efficient than a modem at compressing data. If you believe you have a special situation in which modem data compression is preferable, have the script set up the modem to negotiate data compression.
    8. Turn the modem speaker on or off according to the value of varString2.
3. Enable auto-answering and wait for the result. On an incoming call, the modem issues a RING result code.
4. If the call fails, return an error result code indicating what happened. For example, use error result code -6021 if the modem cannot detect a carrier signal on the phone line. (See technical document 42659 "Remote Access: CCL Result Code Listing" for a complete list.)
5. If the call is successful, indicate that a connection has been established. Display a message such as "Communicating at 9600 bit/s" in the Apple Remote Access Status window. Also display messages indicating the results of error correction and data compression negotiation, if applicable. If you were successful in establishing modem error correction, issue USERHOOK 4 (for MNP10 error correction) or USERHOOK 2 (for all other error correction) to advise Apple Remote Access that a reliable link was established. If you were successful in establishing data compression, issue USERHOOK 3 to advise Apple Remote Access to turn off its built-in data compression.
6. Configure the serial port based on the modem speed and the connection. Issue the USERHOOK 1 command. The USERHOOK 1 command informs Apple Remote Access that the serial port is busy answering a call, which prevents the serial port from being given up to another application. If your modem has a speed of 14,400 bit/s or higher and if you are using a CTS/RTS handshaking cable (as described in Appendix B, "Cable Requirements"), use the HSRESET command to set flow control for outputCTS. Use the COMMUNICATINGAT command to tell Apple Remote Access the connection speed so that it can set its timers appropriately. If your modem has a speed of 9600 bit/s or slower, use the SERRESET command to reset the serial port speed to the speed of the connection.
7. Exit the script so that the Apple Remote Access program can continue with its internal execution.

Terminating a call

To terminate a call, the Apple Remote Access program plays the script starting at the @HANGUP entry point. The hangup part of the script is played to terminate a connection whenever the @ORIGINATE or @ANSWER parts of the script have been played, regardless of the result. The hangup part of the script is also played when Apple Remote Access terminates answer mode because another application gains control of the serial driver or the system is shut down.

Note: Apple Remote Access has a callback feature (see the Apple Remote Access Personal Server User's Guide or the Apple Remote Access Client User's Guide for more information). For callback to work, the script must hang up the modem and prepare it for the return call within 15 seconds, which is the minimum time that the answering side will wait before issuing the callback. The maximum time the calling side (that is, your computer) will wait for a callback is 80 seconds. The script must perform the following tasks to terminate a call:

1. If hardware handshaking is used in the @ORIGINATE or @ANSWER part of the script, turn off hardware handshaking. Use the HSRESET command to turn off hardware handshaking.
2. If possible, cause the modem to enter command mode. Before you issue a hangup command, you may need to get the attention of the modem by, for example, issuing a short break, a long break, or the attention sequence "+++," or by toggling DTR. Consult your modem documentation for the appropriate method.

3. Issue a modem hangup command.
4. Recall the factory default configuration settings. Since you recalled the default settings at the beginning of the script, this is not necessary if the only communications application you use is Apple Remote Access; however, recalling the default settings at the end of your script is recommended in case the next communications application that you use does not take care of this itself.
5. Turn off auto-answering. This prevents the modem from answering the phone until call answering is enabled.
6. Exit with an appropriate message. If successful, return a result code of 0. If unsuccessful, return the appropriate error result code as listed in technical document 42659 "Remote Access: CCL Result Code Listing."

Remote Access: CCL Command Glossary

This document describes the CCL commands interpreted by Remote Access or Internet Connect.

This article has been archived and is no longer updated by Apple.

This document describes the CCL commands interpreted by the Apple Remote Access program. The commands are presented in alphabetical order. Each command section contains a description of the command; the syntax of the command, including any parameters; and an example, if appropriate.

`! Comment`
To insert a comment or a blank line in the script, start the line with an exclamation point. Scripts used in Modem WorkShop may be a maximum of 30 kilobytes. If your script is too large, you may be able to make it small enough by minimizing the number and length of comments.
Syntax `! comment`
Examples `! Turn echo off !`

`@ANSWER`
@ANSWER marks the script entry point when the script plays in answer mode.
Syntax `@ANSWER`

`@HANGUP`
@HANGUP marks the script entry point when the script plays in hangup mode.
Syntax `@HANGUP`

`@LABEL`
@LABEL sets a numeric label in the script that can then be referenced from other script commands, such as JUMP, JSR, and IFTRIES. A script may include up to 128 labels, numbered 1 through 128. To make debugging easier, assign the labels in ascending sequence. They don't need to be consecutive.
Syntax `@LABEL labelnum`
Parameter `labelnum` -a value from 1 through 128 that specifies the label number
Example `@LABEL 30`

`@ORIGINATE`
@ORIGINATE marks the script entry point when the script plays in originate mode (that is, when initiating a call).
Syntax `@ORIGINATE`

`ASK`
ASK causes a dialog box to be displayed to obtain information from the user. The dialog box contains a prompt message, an optional data entry field, a Cancel button, and an OK button. You may need the ASK command if your telephone system uses special telecommunications equipment. This command is typically used in originate mode only. "String Formats" in Chapter 1 shows how to use the ASK string as part of another string. The ASK string is set if the user presses either the OK button or the Cancel button.

Syntax	`ASK maskflag " message" [jumpLabel]`	
Parameters	maskflag	0 to echo the user's input 1 to mask the user's input with bullets (····) 2 to not allow user input
	message	the string to display in the dialog box as a prompt for the use
	jumpLabel	if supplied, the label to jump to, where execution continues when the Cancel button is pressed; if not supplied, or if the OK button is pressed, then execution continues at the next CCL line
Examples	`ASK 1 "Enter your password to access the network."`	
	`ASK 2 "When the remote modem answers, click OK, otherwise click Cancel to stop Manual Dialing."`	

`CHRDELAY`
CHRDELAY allows you to specify a delay time between characters for all subsequent WRITE commands. This is useful for telecommunications equipment that requires data at a speed slower than the interface speed.
Syntax `CHRDELAY x`
Parameter `x` the delay time, in tenths of a second
Example `CHRDELAY 8`

COMMUNICATINGAT

For V.32bis modems with CTS/RTS hardware flow control cables (as described in Appendix B, "Cable Requirements") only: Use the COMMUNICATINGAT command to indicate the speed of the modem connection if the modem speed is different from the serial port speed. This is necessary because the Apple Remote Access application's internal timers are based on the modem speed.

Syntax `COMMUNICATINGAT x`

Parameter `x` the modem speed, in bits per second

Example `COMMUNICATINGAT 4800`

DECTRIES

DECTRIES decreases the variable tryCounter by one. The CCL interpreter maintains tryCounter, which you may set to a value and increase or decrease by one. See also the commands IFTRIES, INCTRIES, and SETTRIES.

Syntax `DECTRIES`

DTRCLEAR

DTRCLEAR clears (that is, deasserts) the Data Terminal Ready (DTR) signal on the RS-232 interface.

Syntax `DTRCLEAR`

DTRSET

DTRSET sets (that is, asserts) the Data Terminal Ready (DTR) signal on the RS-232 interface.

Syntax `DTRSET`

EXIT

EXIT terminates execution of the script and returns a result code along with an optional string.

- If the script executes successfully, have it return a result code of 0.
- If the script fails for any reason, have it return the appropriate error result code, as listed in technical document 42659 "**Remote Access: CCL Result Code Listing.**"
- To give the user a nonstandard error message, use result code -6002 and use the string parameter to pass the nonstandard error message.

Syntax	`EXIT result [" string"]`	
Parameters	result	One of the CCL result codes listed in technical document 42659 "**Remote Access: CCL Result Code Listing.**"
	string	The message displayed to the user when a connection attempt fails; if you include a string for one of the standard result codes, it overrides the one that CCL would normally display
Examples	EXIT -6022	
	EXIT -6002 "unable to communicate with PBX"	

FLUSH

FLUSH empties all characters from the serial driver input buffer.

Syntax `FLUSH`

HSRESET

HSRESET sets the serial port's flow control options. If you are using a standard modem cable, you will turn off flow control and leave it off. If you are using a CTS/RTS handshaking cable such as described in technical document 42660 "Remote Access: Modem Cable Requirements," you need only the outputCTS parameter. Turn all options off at hangup.

Syntax	`HSRESET outputXON/XOFF outputCTS XON XOFF inputXON/XOFF inputDTR`	
Parameters	outputXON/XOFF XON/XOFF	Handshaking for output. For Apple Remote Access, it must be off
	outputCTS	CTS hardware handshaking for output. For Apple Remote Access, if you are using a CTS/RTS handshaking cable, it should be on for originate and answer modes and off for hangup mode. For more information, see Inside Macintosh, volume 2 (no longer in print) or Inside Macintosh: Devices, available through the Apple Developer Catalog.

	XON	Specifies the XON character (DO NOT USE for Apple Remote Access)
	XOFF	Specifies the XOFF character (DO NOT USE for Apple Remote Access)
	inputXON/XOFF XON/XOFF	Handshaking for input. For Apple Remote Access, it must be off
	inputDTR	DTR hardware handshaking for input. For Apple Remote Access, it should be off. For more information, see Inside Macintosh, volume 4 (no longer in print) or Inside Macintosh: Devices, available through the Apple Developer Catalog.
Example	`HSRESET 0 1 0 0 0 0`	

`IFANSWER`
If the script is playing in answer mode, IFANSWER causes execution to continue at the specified label.
Syntax `IFANSWER jumpLabel`
Parameter `jumpLabel` the label to jump to, where execution continues
Example `IFANSWER 30`

`IFORIGINATE`
If the script is playing in originate mode, IFORIGINATE causes execution to continue at the specified label.
Syntax `IFORIGINATE jumpLabel`
Parameter `jumpLabel` the label to jump to, where execution continues
Example `IFORIGINATE 7`

`IFSTR`
IFSTR compares two strings: one of the variable strings (varStrings, described in "Variable Strings (varStrings)" in technical document 42657 "**Remote Access: Modem Script Basics"**) and one that you specify in the script. If the strings are equal, the script continues execution at the specified label.

Syntax	`IFSTR varStringIndex jumpLabel " compareString"`	
Parameters	varStringIndex	The number of the variable string to compare
	jumpLabel	The label to jump to, where execution continues
	compareString	The string to which the variable string is compared In the following example, if the modem speaker flag (varString 2) is on (1), execution jumps to label 55. Otherwise, the next command is executed.
Example	`IFSTR 2 55 "1"`	

`IFTRIES`
IFTRIES compares a parameter with the variable tryCounter. If the value of tryCounter is greater than or equal to the parameter, the script continues execution at the specified label. See also the commands DECTRIES, INCTRIES, and SETTRIES.

Syntax	`IFTRIES numTries jumpLabel`	
Parameters	numTries	The parameter to compare with the variable tryCounter
	jumpLabel	The label to jump to, where execution continues The following example checks to see if the value of tryCounter is greater than or equal to 3. If so, execution jumps to label 62 and continues.
Example	`IFTRIES 3 62`	

`INCTRIES`
INCTRIES increases the variable tryCounter by one. See also the commands DECTRIES, IFTRIES, and SETTRIES.
Syntax `INCTRIES`

`JSR`
JSR causes script execution to jump to the subroutine located at the specific label, saving the address of the line following the JSR command. When a RETURN command is encountered, execution resumes at the line following the JSR command. JSR commands can be nested up to 16 deep.
Syntax `JSR jumpLabel`
Parameter `jumpLabel` the label to jump to, where execution continues
Example `JSR 50`

JUMP

JUMP causes script execution to continue at the specified label.
Syntax `JUMP jumpLabel`
Parameter `jumpLabel` the label to jump to, where execution continues
Example `JUMP 59`

LBREAK

LBREAK generates a long break (3.5 seconds) on the transmission line.
Syntax `LBREAK`

MATCHCLR

The CCL interpreter has a buffer that holds up to 32 strings loaded by the MATCHSTR command. The MATCHCLR command erases all strings in the buffer. Use MATCHCLR before loading each new group of strings. See also the commands MATCHREAD and MATCHSTR.
Syntax `MATCHCLR`

MATCHREAD

The CCL interpreter has a buffer that holds up to 32 strings loaded by the MATCHSTR command. MATCHREAD reads input from the serial driver and compares the input to the strings currently in the buffer. If a match is found within the specified MATCHREAD time, execution continues at the label associated with that match string (as defined by the MATCHSTR command that loaded the string). See also the commands MATCHCLR and MATCHSTR.
Syntax `MATCHREAD time`
Parameter `time` the time allowed for a match, in tenths of a second The following example searches for a match within 3 seconds.
Example `MATCHREAD 30`

MATCHSTR

The CCL interpreter has a buffer that holds up to 32 strings. MATCHSTR loads a string to the buffer, so that incoming strings can be matched against it by a MATCHREAD command. If an incoming string matches the stored string, script execution continues at the label specified in the MATCHSTR command. See also the commands MATCHCLR and MATCHREAD.

Syntax	`MATCHSTR matchNum matchLabel " matchStr"`	
Parameters	matchNum	A value from 1 through 32 specifying which string in the buffer to replace
	matchLabel	The label to jump to, where execution continues when a MATCHREAD command detects a matching string matchStr a string (1-255 characters) to compare against The following example loads the string "OK\\13\\10" into the buffer as string 1. If a subsequent MATCHREAD reads a string that matches this one, then execution jumps to label 8.
Example	`MATCHSTR 1 8 "OK\\13\\10"`	

NOTE

The NOTE command displays status and log information, passing the message string as a parameter. Optionally, you can set the message level to specify where the message should appear. Note: While in answer mode, NOTE does not write to the Activity Log or to the status window.

Syntax	`NOTE msgStr [ msgLevel]`	
Parameters	msgStr	The message to display
	msgLevel	The message level 1, 2, or 3 (default is 3) 1 send the message to the Activity Log only 2 send the message to the Apple Remote Access Status window only 3 send the message to both the Activity Log and the Apple Remote Access Status window The following examples show important places in which you should use the NOTE command. In the first example, the script logs outgoing calls by displaying the dialed phone number in the Apple Remote Access Status window and the Activity Log. In the second example, the script displays the speed of the connection in the Apple Remote Access Status window.
Examples	`NOTE "DIALING ^1" 3 NOTE "Communicating at 9600 bps." 2`	

PAUSE

PAUSE causes script execution to halt for a specified period of time.
Syntax `PAUSE time`
Parameter `time` the time to pause, in tenths of a second The following example causes script execution to pause for 2 seconds.
Example `PAUSE 20`

`RETURN`
RETURN terminates a subroutine. Script execution continues with the line following the JSR command.
Syntax `RETURN`

`SBREAK`
SBREAK generates a short break (.5 seconds) on the transmission line.
Syntax `SBREAK`

`SERRESET`
SERRESET configures the serial port by passing values for baud rate, parity, data bits, and stop bits to the serial driver. Specifying a value other than the values listed below causes the default value to be used. The defaults for each parameter are listed below.

Syntax	`SERRESET baudRate, parity, dataBits, stopBits`	
Parameters	baudRate	300, 1200, 2400 (the default), 4800, 9600, 14,400, 19,200, 28,800, 38,400, or 57,600
	parity	1 for odd parity 2 for even parity 0 or 3 for no parity (the default)
	dataBits	5, 6, 7, or 8 (the default)
	stopBits	1 for 1 stop bit (the default) 2 for 2 stop bits 3 for 1.5 stop bits
Example	`SERRESET 9600, 0, 8, 1`	**Note:** Apple Remote Access requires no parity, 8 data bits, and 1 stop bit.

`SETSPEED`
SETSPEED sets the asynchronous serial interface speed to the specified speed. Use SETSPEED to set speeds other than those allowed in SERRESET.
Syntax `SETSPEED interfacespeed`
Parameter `interfacespeed` the serial interface speed
Example `SETSPEED 24000`

`SETTRIES`
SETTRIES initializes the tryCounter variable to the specified value. See also the commands DECTRIES, IFTRIES, and INCTRIES.
Syntax `SETTRIES tries`
Parameter `tries` the value to assign to the tryCounter variable
Example `SETTRIES 0`

`USERHOOK`
USERHOOK conveys information about the state of the modem to Apple Remote Access.

Syntax	`USERHOOK opcode`	
Parameter	opcode	1 to indicate that the script is answering a call and that a ring is indicated by the modem. This prevents other applications from using the serial port until after the call has terminated. 2 to report that the modem is doing error correction (other than MNP10, which is indicated by opcode 4). 3 to request that Apple Remote Access turn off its built-in data compression. 4 to report that the modem is doing MNP10 error correction.
Example	`USERHOOK 1`	

`WRITE`

WRITE writes the specified string to the serial driver.
Syntax `WRITE message`
Parameter `message` the message written to the serial driver
The following example sends to the serial driver the modem command ATDT followed by variable string 1 and a carriage return. (For more information, see "Variable Strings (varStrings)" in technical document 42657 "**Remote Access: Modem Script Basics."**
Example `WRITE "ATDT^1\\13"`

Remote Access: CCL Result Code Listing

This document lists the result codes returned by the Communication Command Language (CCL) used in modem scripts for Remote Access and Internet Connect.

This article has been archived and is no longer updated by Apple.

This document lists the result codes returned by the Communication Command Language (CCL). Each result code is shown with a description of the error and the message, if any, that is displayed to the user. If the script executes successfully, have it exit with result code 0. If the script is unsuccessful for any reason, have it exit with one of the error result codes listed in this document. Note that result code -6002 allows you to pass a custom message to the user.

Result code	Description	Message displayed
-6002	Generic CCL error.	Supplied by the string parameter in the EXIT command.
-6003	Subroutine overflow.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6004	The target label is undefined	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6005	Bad parameter error.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6006	Duplicate label error.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6007	Close error.	[No message is displayed.]
-6008	The script was canceled.	[No message is displayed.]
-6009	The script contains too many lines.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6010	The script contains too many characters.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6011	The CCL has not been initialized.	[No message is displayed.]
-6012	Cancel in progress.	[No message is displayed.]
-6013	Another script is in progress.	[No message is displayed.]
-6014	Exit with no error.	[No message is displayed.]
-6015	A label is out of range.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6016	Bad command.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6017	End of script reached; expected Exit.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6018	The match string index is out of bounds.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6019	Modem error; the modem is not responding.	Modem not responding. Reset modem, check connections, or check to see that the proper port and modem type were specified in the Remote Access Setup control panel.
-6020	No dial tone.	The modem cannot acquire a dial tone.
-6021	No carrier.	The modems could not connect. Try again.
-6022	The line is busy.	The phone number you are calling is busy.
-6023	No answer.	The phone number you are calling does not answer.
-6024	No @ORIGINATE command in the modem script.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6025	No @ANSWER command in the modem script.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.
-6026	No @HANGUP command in the modem script.	The file for the modem you selected does not work properly. It may be damaged; try replacing the file in the Extensions folder.

iDVD: Compatibility information for DVD-R playback devices

iDVD, iDVD 2, iDVD 3, and iDVD 4 can produce DVDs that can be played on:

- Most standard set-top DVD players
- Most computers with DVD Video drives

This article has been archived and is no longer updated by Apple.
DVD-R discs produced with Apple SuperDrives are compatible with a wide variety of DVD hardware. Check the documentation that came with your player or with the manufacturer to find out if it is compatible with DVD-R media.

Maximizing Ethernet performance

This article has been archived and is no longer updated by Apple.

Learn how to maximize Ethernet performance on your Mac.

Connect to an auto-negotiated Ethernet port

For best networking results when using Ethernet, the Ethernet port which your Mac is connected to should be set to auto-negotiate. If you are not sure, ask your network administrator to verify this setting.

Important: Ethernet network connection issues may indicate that the network switch is not set to auto-negotiate. If a switch's port is not auto-negotiating, your computer detects the appropriate speed but defaults to half-duplex mode. If the switch's port at the other end of the link is configured for full-duplex, a large number of late events can occur on the link. If it isn't possible to set the switch to auto-negotiate, then set the switch's port to half-duplex. For more information, see the documentation that came with the Ethernet switch.

Disable spanning tree if directly connected to a switch

Note: If you connect your computer directly to a configurable Ethernet switch, have your network administrator disable spanning tree on that port. Otherwise your computer may duplicate the AppleTalk address of another computer on the same network and both network connections may become unreliable.

Power Mac G4 (QuickSilver 2002): About SCSI Devices

This document discusses the Ultra160 Dual Channel SCSI card that comes with some Power Mac G4 (QuickSilver 2002) configurations.
This article has been archived and is no longer updated by Apple.
Some Power Mac G4 computer configurations come with an Ultra160 Dual Channel SCSI card installed in a PCI slot with one or more internal SCSI hard disks connected to it. You
can install additional internal SCSI hard disk drives, up to a maximum of three drives. It's recommended that you only connect SCSI Ultra160 LVD hard disk drives to the internal port
of the Dual Channel SCSI card.

You can connect external SCSI devices, including older drives with slower data transfer rates, to the external port of the Ultra160 Dual Channel SCSI card.
Because the card has two channels, one connected to the internal port and another connected to the external port, connecting older devices to the external port doesn't slow down the transfer rate of the internal hard disk drives.

Apple recommends that you use only SCSI Ultra160 LVD devices as internal hard disk drives.

To connect older SCSI devices that use a 25-pin or a 50-pin connector-such as Zip drives, scanners, or DAT drives-you need to purchase SCSI adapters, or purchase and install an additional "legacy" SCSI PCI card (one that supports older devices). See document 42667 "**Power Mac G4 (QuickSilver 2002): About the Ultra SCSI PCI Card**" for information on the configure-to-order Ultra SCSI card Apple offers.

Published Date: Feb 20, 2012

Power Mac G4 (QuickSilver 2002): About the Ultra SCSI PCI Card

This document discusses the Ultra SCSI PCI card option available with the Power Mac G4 computers that allows connecting older legacy devices.

This article has been archived and is no longer updated by Apple.
The Ultra SCSI PCI card lets you use older external SCSI devices such as tape drives, scanners, and hard disks with your new Power Mac G4 or Macintosh Server G4. You can connect standard SCSI (SCSI-1), Fast SCSI (SCSI-2), and Ultra SCSI (also called Ultra Narrow SCSI) peripherals to the Ultra SCSI card. With the card installed, you can also start up your computer from externally connected drives.

This economical and convenient option lets you connect up to seven SCSI devices, as long as the total cable length measures no more than 6 meters, or about 18 feet. The card supports cable lengths of 1.5 meters when running in Ultra SCSI mode or 6 meters when running in SCSI-1 or SCSI-2 mode. Ultra SCSI mode supports transfer rates of up to 20 megabytes per second (MBps). SCSI-2 mode supports up to 10MBps, and SCSI-1 supports up to 5MBps. The Ultra SCSI card includes a 25- to 50-pin cable adapter.

SCSI Type	Speed	Connector	SCSI Ids
SCSI (SCSI-1) *	5MBps	25- and 50-pin	7
Fast SCSI (SCSI-2) *	10MBps	25- and 50-pin	7
Fast Wide SCSI	20MBps	50-pin	15
Ultra SCSI *	20MBps	50-pin	7
Ultra Wide SCSI	40MBps	68-pin	15
Ultra2 LVD SCSI	80MBps	68-pin	15
Ultra160 SCSI	160MBps	68-pin	15
* Works with Ultra SCSI card			

Note: Different types of SCSI devices connected to a SCSI channel operate only as fast as the slowest device on the chain. For example, a SCSI-2 (10MBps) tape drive and an Ultra160 SCSI (160MBps) hard disk on the same SCSI channel will both operate at 10MBps. However, with the dual-channel Ultra160 SCSI card, you can easily connect external SCSI devices on the second SCSI chain without affecting the performance of your internally connected Ultra160 SCSI drives.

Power Mac G4 (QuickSilver 2002): How to Transfer Files

This document discusses ways to transfer files to the Power Mac G4 (QuickSilver 2002).
This article has been archived and is no longer updated by Apple.
If two Macintosh computers are not connected by a network, you can transfer information between them by connecting them with a standard category 5, 4 wire-pair (8 wires) Ethernet
cable (in effect creating a small network of just two computers), which you can buy from an Apple-authorized dealer. You connect the cable to each computer's Ethernet port and then turn on file sharing on both computers. You can also configure the Ethernet settings on two computers to create a small network. Technical document 43015 referenced below links to steps for file sharing using Mac OS X and Mac OS 9.

You can also connect two Macintosh computers using a FireWire cable. You can then use FireWire target disk mode to transfer files from one computer to another. For more information about using FireWire target disk mode, see "FireWire Target Disk Mode" on page 54 of the "Setting Up Your Power Mac G4" manual or see technical document 58583 referenced below.

If you have an Internet connection, you can also transfer files via the Internet to your iDisk storage area on .Mac, where you or another .Mac user can download them. For more information about .Mac, see technical document 72002 referenced below for how to setup and use an .Mac account.

Related documents

- 43015 "**Mac OS: How to Connect Two Computers**"

Gigabit Ethernet: No Crossover Cable Required

This document discusses when an Ethernet crossover cable is necessary with gigabit Ethernet capable computers.

This article has been archived and is no longer updated by Apple.

Connecting a gigabit Ethernet capable computer to any other computer using Ethernet can be accomplished with a standard four pair category 5 or better Ethernet cable. No crossover cable is necessary.

Gigabit Ethernet capable computers include:

- Power Mac G4 (Gigabit Ethernet)
- Power Mac G4 (Digital Audio)
- Power Mac G4 (QuickSilver)
- Power Mac G4 (QuickSilver 2002)
- PowerBook G4 (Gigabit Ethernet)

Published Date: Feb 20, 2012

Power Mac G4 (QuickSilver 2002): How to Use FireWire Devices

This document discusses what types of devices can be connected to the FireWire ports and generic steps to use most devices.
This article has been archived and is no longer updated by Apple.
Your computer has two FireWire ports. FireWire is a high-speed data transfer system that lets you easily connect and disconnect external devices-such as digital video (DV) cameras, printers, scanners, and hard disks. You can connect and disconnect FireWire devices without restarting your computer.

These are some of the things you can do with FireWire:

- Connect a digital video camera and capture or transfer high-quality video directly to your computer. Then you can use video-editing software such as Apple's iMovie to edit the video.
- Connect an external FireWire hard disk drive and use it to back up data or transfer files. If you have installed software for your FireWire hard disk, the FireWire disk icon appears on your desktop after you connect the disk drive to your Power Mac G4. Some FireWire hard disks get their power through the FireWire cable, so you don't need to connect an external power supply.
- If you have a problem with your computer that prevents you from starting up or you want to transfer files, you can use FireWire to connect your Power Mac G4 to another computer so that your Power Mac G4 appears as an external hard disk on the other computer (a feature known as "FireWire target disk mode"). See technical document 58583 "**Macintosh: How to Use FireWire Target Disk Mode**" for more information.

To use a FireWire device with your computer, connect the device to the computer and install any software that came with the device. Your computer automatically senses when you attach a new device. To start up from a FireWire hard disk that has the Mac OS on it, choose System Preferences from the Apple (K) menu, click Startup Disk, then select the FireWire hard disk as the startup disk.

If your FireWire hard disk doesn't appear or can't be selected, consult the FireWire hard disk vendor for updated software drivers.

To disconnect your FireWire hard disk safely, drag its icon to the Trash before disconnecting the FireWire cable.

Power Mac G4 (QuickSilver 2002): About Your Apple Pro Keyboard

This document discusses the Apple Pro Keyboard that comes with the Power Mac G4 (QuickSilver 2002) and its preset function keys.
This article has been archived and is no longer updated by Apple.
Your Apple Pro Keyboard comes with function keys preset for common tasks (Figure 1). Use the Media Eject key to eject optical disks. Press the Volume Up or Volume Down keys to adjust the sound level, or press the Mute key to turn sound off. You can also adjust some Apple display's level of brightness with the Brightness Up and Brightness Down keys.

Figure 1 Keyboard layout with presets

Note: If you're using a non-Apple keyboard with your computer, use the F12 key to eject optical disks. You will need to press and hold the key slightly longer than when pressing the Media Eject key.

Customizing Function Keys (Mac OS 9)

In Mac OS 9, you can set unassigned function keys (F1-F13) on your Apple Pro Keyboard to open applications such as your Web browser, email program, or frequently used documents. Once applications are open, you can use the customized function keys to switch quickly between them.

The first time you press an unassigned function key, a dialog box appears that lets you assign any of the function keys to an application or document. You can change the application assigned to a function key using the Keyboard control panel.

Note: You can't customize function keys in Mac OS X without the addition of third-party software. Search the Macintosh Products Guide for software options.

Published Date: Feb 20, 2012

Power Mac G4 (QuickSilver 2002): About the Apple Pro Mouse

This document discusses the Apple Pro Mouse that comes with the Power Mac G4 (QuickSilver 2002).
This article has been archived and is no longer updated by Apple.
To position the pointer using your mouse, move the mouse over any suitable surface such as your desktop, mouse pad, or other textured surface. (Some smooth, glassy surfaces provide less pointer control than others.) To click an object, press down once on the mouse body until you feel a click. To double-click an item, press down twice in quick succession.

If you run out of room and want to keep the mouse clicked while you lift it, click the mouse, then squeeze the sides with your thumb and fingers as you lift (Figure 1).

Figure 1 Click and lift the mouse

You can adjust the feel of your mouse by turning the dial underneath. Turning the dial one direction makes the feel of clicking the mouse stiffer; turning it the other way makes clicking the mouse easier.

Turn the ring on the bottom of the mouse to "+" for more tension, "O" for medium tension, and "-" for less tension (Figure 2).

Figure 2 Tension adjuster

Power Mac G4 (QuickSilver 2002): How to Connect a Second Display

This document discusses how to connect a second display to the Power Mac G4 (QuickSilver 2002).

This article has been archived and is no longer updated by Apple.
You can connect two displays to your graphics card and use both displays at the same time. When a second display is connected, you can either have the same image appear on both displays (known as mirroring) or use the second display to extend the size of the Mac OS desktop (known as extended desktop mode).You need a video cable for each display you want to connect.

To use multiple displays:

1. Turn off the displays and shut down your computer.
2. Connect the video cable from each display to the appropriate port on the graphics card.
3. Turn on the displays and start up your computer.

To adjust the displays, choose System Preferences from the Apple Menu and choose Displays from the View menu. By default, your computer starts up in extended desktop mode. To work in video mirroring mode, turn Video Mirroring on with the Displays icon in the menu bar in Mac OS X. You can press the Command key and the F1 key to switch between video mirroring and extended desktop mode.

Important: For optimal mirroring performance, set both displays to the same resolution and color depth.

Power Mac G4 (QuickSilver 2002): About USB Devices

This document discusses the USB ports on the Power Mac G4 (QuickSilver 2002) and what types of devices may be connected to them.

This article has been archived and is no longer updated by Apple.

Your Power Mac G4 comes with two USB ports (Figure 1) which you can use to connect many types of external devices, including printers, digital cameras, microphones, game pads, joysticks, keyboards, mouse devices, and storage devices. USB makes it easy to connect external equipment. Once you connect the device, it is ready to use. You don't need to restart your computer.

Figure 1 USB port location

To use a USB device with your computer, connect the device to the computer and install its software or configure your computer to work with the device. From then on, your computer automatically loads the correct software whenever you attach the device.

Note: Apple has already included software to work with many USB devices. In most cases you do not need to install the software that came with the device. If, when you connect a USB device, your Power Mac G4 cannot find the correct software, it may ask you to search the Internet to find it.

Connecting Multiple USB Devices

Your keyboard or monitor may also have an available USB port that you can use to connect devices. If you want to connect more devices, purchase a USB hub. The USB hub connects to an open port on your computer and provides additional USB ports (usually four or seven). Search the **Macintosh Products Guide** for hub options.

Published Date: Feb 20, 2012

Power Macintosh G4 (QuickSilver 2002): About CD-R/CD-RW Discs

This document describes how CD-R and CD-RW discs can be used and includes steps
This article has been archived and is no longer updated by Apple.
Your drive can record your favorite music, programs, and files on CD-R and CD-RW discs. You can create your own music CDs and play them on any standard audio player. You can also record computer files, such as applications, documents, or other digital files, on a recordable CD.

With a CD-R disc (CD-Recordable), you can record information on the disc once. Although you can't change the recorded information, you may be able to add more information until the disc is full, depending on the application you use. See the documentation that came with your application for specific information about recording on your CD-R disc. It is best to use CD-R discs for recording audio CDs, because most audio CD players cannot read CD-RW discs.

With a CD-RW disc (CD-Rewritable), you can save and change information on your CD multiple times. However, some software for recording media files on CDs, such as the iTunes Disc Burner feature, can record data on the disc only once. You can record music on CD-R or CD-RW discs right from your iTunes library.

For steps to burn a disc and information about choosing a disc format see technical document 58804 "**Macintosh: How to Burn a CD and Choose a Format**." For third-party CD-R burning utilities search the **Macintosh Product Guide**.

Power Mac G4 (QuickSilver 2002): How to Connect to an Ethernet Network

This document describes how to connect a Power Mac G4 (QuickSilver 2002) to an Ethernet network.
This article has been archived and is no longer updated by Apple.

Connecting to an Ethernet Network

Your computer comes with built-in 10/100/1000 megabit per second (Mbps) twisted-pair Ethernet networking capability. Connecting to a network gives you access to other computers. You may be able to store and retrieve information; use network printers, modems, and electronic mail; or connect to the Internet. You can also use Ethernet to share files between two computers or set up a small network. If you're connecting to an existing network, you may be able to get information about the network and the network software you need from a network administrator who oversees its operation. Identify your organization's network administrator before you begin.

Follow these guidelines when selecting a cable for your network:

Type of twisted-pair Ethernet	Use twisted-pair cable types
10 Mbit	Category 3, 5, or 6
100/1000 Mbit	Category 5 or 6

Connecting to a Twisted-Pair Ethernet Network

You can connect directly to a 10/100/1000 twisted-pair Ethernet network.

Note: You can also connect your computer to an Ethernet network that uses thin coaxial cables. To do this, you need an RJ-45-to-Thin Coax adapter (available from other manufacturers). See your Apple-authorized reseller or search the Macintosh Product Guide for more information on Ethernet media adapters.

To connect your Macintosh to a centralized 10/100/1000 twisted-pair Ethernet network, follow these steps:

1. Plug one end of an RJ-45 twisted-pair cable into the Ethernet port on your Macintosh.
2. Plug the other end of the cord into an RJ-45 wall outlet or external hub that is connected to a twisted-pair Ethernet network (Figure 1). After you start up the computer, you need to configure the software for your network connection. Your network administrator can provide the necessary information. You can also get help configuring your network software using Mac Help (in the Help menu).

A basic twisted-pair network

To configure your network settings:

1. Choose **System Preferences** from the **Apple** menu, then choose **Network** from the **View** menu.
2. Show Built-in Ethernet.
3. Click the TCP/IP tab and enter information about your network. The default setting is Configure Using DHCP.
4. Click Apply Now.
5. Close System Preferences.

QuickTime Pro: How to Import MP3 Files

This document discusses how to import MP3 files into a new movie using QuickTime Player with QuickTime Pro.

This article has been archived and is no longer updated by Apple.

If you have QuickTime Pro, you can use QuickTime Player to convert files from an MP3 music file into QuickTime movies.

In QuickTime Player:

1. Choose Import from the File menu. Locate and select the music file you would like to use then click Open. The music file will open in a new QuickTime Player window.

If you will be adding the music to an existing movie, continue with the following steps:

1. Choose Open Movie In New Player from the File menu. Locate the movie you want to add music to and click Open.
2. Click the music file window to make it active and choose Select All from the Edit menu.
3. Choose Copy from the Edit menu. This will copy the entire song into memory for adding to the existing movie.
4. Click to make your existing movie the active window.
5. Choose Add from the Edit menu. If you don't see Add under Edit, then hold the Option key (Mac) or Ctrl and Alt Keys (Windows) on the keyboard. While holding the keys, go to the Edit menu and choose the Add. (In the Edit menu, the item normally labeled Paste changes to Add when holding the Option or Ctrl and Alt key.)
6. Choose Save As from the File menu. A "Save" dialog box will appear. Enter a new name in the "New file name" box. Next, select the radio button labeled "Make movie self-contained" and then click the Save button.

Power Mac G4 (QuickSilver 2002): How to Use Energy Saver

This document discusses how to use the power saving functions in Energy Saver for the Power Mac G4 (QuickSilver 2002).
This article has been archived and is no longer updated by Apple.
Power Mac G4 computers are set to go to sleep after a period of inactivity. Sleep is a state in which your computer uses very little power. You can also put the computer to sleep whenever you want.

Note: Power Mac G4 computers are automatically set to sleep after 20 minutes of inactivity. When the computer goes to sleep, it saves its state so that when you wake the computer, your programs, documents, and computer settings are exactly as you left them. To save more energy, shut down the computer or shut down and turn off the power strip when the computer is not in use.

To put your computer to sleep, you can do any of the following:

- Press the power button on the front of the computer.
- Choose Sleep from the Apple menu (Special menu in Mac OS 9).
- Set a sleep timer in your computer's sleep settings by choosing System Preferences from the Apple menu and choosing Energy Saver from the View menu (In Mac OS 9, choose Control Panels from the Apple menu and Energy Saver from the sub-menu).

When the computer is in sleep, the front panel power button light pulses. To wake the computer, press the power button on the front panel of the computer, or press a key on the keyboard. With some Apple monitors, you can also use the monitor's power button to put the computer to sleep and wake it.

Not all PCI cards or replacement AGP cards comply with the computer's power management standards. If you install a non-compliant card, the computer can still enter sleep mode, but it will not achieve maximum energy saving. You can use the Apple System Profiler to find out whether an installed card is compliant.

Power Mac G4 (QuickSilver 2002): How to Configure Computer As a Server Without a Monitor

This document discusses how to configure a Power Mac G4 (QuickSilver 2002) as a server without a display (headless server).
This article has been archived and is no longer updated by Apple.
Using the Computer as a Server Without a Monitor

You can set up your computer to run as a server without an attached monitor. Follow these steps:

1. Set up your computer, including connecting a monitor, mouse, and keyboard as described in the "Setting Up Your Power Mac G4" manual.
2. Configure your server software as follows:
    - Configure network access.
    - Configure the security application so that the server can be controlled remotely.
    - Set passwords for access to the server.
    - Set network services to start up when the system starts up.
3. Be sure network services are operating properly.
4. Disconnect the monitor.

If you're using remote access software, follow the instructions that came with your software for logging into and controlling the server.

Published Date: Feb 20, 2012

Power Mac G4 (QuickSilver 2002): About Adding Memory

This document overviews the memory requirements for the Power Mac G4 (QuickSilver 2002) computers.
This article has been archived and is no longer updated by Apple.
Installing Memory

You can install additional dynamic random-access memory (DRAM) in packages called Dual Inline Memory Modules (DIMMs) in the three DRAM DIMM slots on your computer's main logic board. You can expand your computer's DRAM to a maximum of 1536 megabytes (1.5 gigabytes). To check the amounts of DRAM installed, use the Apple System Profiler (located in the Utilities folder, in your computer's Applications folder).

If you install 512 MB DIMMs, they must have 256 megabit (Mbit) devices. You can also install 256 MB DIMMs that have 256 Mbit or 128 Mbit devices. You can install different size DRAM DIMMs in any order in any DIMM slot. To search for compatible DIMMs, see the **Macintosh Products Guide**.

DIMMs must fit these specifications:

- "PC-133" Synchronous DRAM (SDRAM)
- 3.3 volt (V)
- 64-bit wide, 168-pin module
- Maximum number of memory devices on a DIMM is 16.
- Unbuffered; do not use registered or buffered SDRAM.
- Height must not exceed 2.0 inches.

Note: When purchasing DRAM for use in Macintosh computers, make sure that the memory vendor conforms to the JEDEC specification. Check with your memory vendor to ensure that the DRAM DIMM supports the correct timing modes and that the Serial Presence Detect (SPD) feature has been programmed properly, as described in the JEDEC specification. You can purchase Apple-branded memory online from the Apple Store: store.apple.com

Important: DIMMs from older Macintosh computers may not be compatible with your Power Mac G4. Only "PC-133" DIMMs are compatible. Do not use older DIMMs even if they fit into the DRAM DIMM slots.

Warning

Apple recommends that you have an Apple-certified technician install memory, PCI expansion cards, and internal storage devices. Consult the service and support information that came with your computer for instructions on how to contact an Apple authorized service provider or Apple for service. If you install these items yourself, you risk damaging your equipment, and such damage is not covered by the limited warranty on your computer. See an Apple authorized dealer or service provider for additional information about this or any other warranty question.

Mac OS 9: Reinstalling Printer Drivers

This document talks about the need to reinstall some printer software following a clean installation and which current StyleWriter drivers to use for earlier StyleWriter printers.

This article has been archived and is no longer updated by Apple.

If an icon for your printer is not available in the Chooser after you have done a clean installation of Mac OS 9.2, you may need to reinstall the software that came with your printer.

- If you have a StyleWriter, StyleWriter II, or StyleWriter 1200, use the Color SW 1500 driver that comes with Mac OS 9.2 (instead of installing your original printer software).
- If you have a Color StyleWriter 2200 or 2400, install the Color StyleWriter 2500 driver that comes with Mac OS 9.2 (instead of installing your original printer software).
- If you have a Color StyleWriter 4000 Series printer, you can find the latest driver in the CD Extras folder on your system software CD.

You may also need to reinstall fonts that came with your printer software. Follow the instructions that came with your printer software.

Power Mac G4 (QuickSilver 2002): Important Information About System Sleep

This document discusses important information about system sleep and your Power Mac G4 computer.
This article has been archived and is no longer updated by Apple.
Important information about system sleep

Certain system settings may prevent your computer from going to sleep. You may notice that the screen dims and the sleep indicator light pulses, but the internal fan still runs.

Many communications programs, such as PPP, Apple Remote Access, and other dialup programs, monitor the computer's modem port to check for incoming transmissions when set to auto-answer incoming calls. This may prevent the computer from going into sleep completely.

If the Configure pop-up menu in the TCP/IP control panel (Mac OS 9) is set to Using DHCP Server, your computer may not sleep when your Web browser or email application is open or a file server is mounted on your desktop. Quit these applications and unmount file servers when they are not being used.

The Palm Desktop HotSync function may prevent your computer from going to sleep. To turn off the HotSync function, open Palm Desktop and choose Setup from the HotSync menu. Then click the Disabled button and verify that the "Enable HotSync software at system startup" checkbox is not selected. Turn HotSync back on when you want to synchronize with your Palm-compatible device.

If you use fax software, such as FAXstf, and the software is set to auto-answer, your computer may not sleep completely. The screen will dim (instead of turn off). To allow your computer to sleep, disable auto-answering. To disable auto-answering in FAXstf, open FaxBrowser and choose Settings from the Edit menu. Then choose the FaxModem icon and choose Never from the Answer On pop-up menu.

Note: If you connect a USB device while the computer is in sleep, your computer wakes.

Power Mac G4 (QuickSilver 2002): About Older Macintosh USB Keyboards

This document has information on using older Macintosh USB keyboards (with a power key) on the Power Mac G4 (QuickSilver 2002).
This article has been archived and is no longer updated by Apple.
You can use the Power button on older Apple USB keyboards to turn on your computer when it is connected to a USB port on your computer.

You cannot use the Power button to turn on your computer when the keyboard is connected to a USB hub or to a USB port on your monitor. You can also turn on the computer using the Power button on the computer. If you have an Apple Display with an ADC connector, you can also use the power button on the front of the display.

Published Date: Feb 20, 2012

Power Mac G4 (QuickSilver 2002): About Writing to CDs

This document has important information regarding the optical drive that came with your computer.

This article has been archived and is no longer updated by Apple.

Your optical drive supports both normal and "High-Speed" (greater than 4x) CD-R and CD-RW media with a 74-minute media capacity.

If you have a SuperDrive, it can read but cannot write to high-speed CD-RW media.

When handling discs, be careful not to leave fingerprints, place other materials on the discs, or add labels to the discs that may cause them to become unbalanced when spinning.

Use CD-R discs for recording audio CDs, because most audio CD players cannot read CD-RW discs.

Published Date: Feb 20, 2012

Power Mac G4 (QuickSilver 2002): About Apple DVD Player

This document has important information about the Apple DVD Player 2.7 available under Mac OS 9 on your computer.
This article has been archived and is no longer updated by Apple.
If your computer has an optical drive with DVD playback capability, use Apple's DVD Player application. For information on optimal system settings for DVD playback, see technical document 42705 "**About Apple DVD Player, Version 2.7.**"

If you use Mac OS 9 and Multiple Users is enabled in the Multiple Users control panel, Apple DVD Player will open automatically when you start up your computer. To prevent this, open the Extensions Manager control panel and turn off the DVD AutoLauncher extension. To play a DVD video, open Apple DVD Player (in the Apple menu).

About Apple DVD Player, Version 1.3

This document contains important information about your Apple DVD software that's not included in the printed information you received with your DVD player or the Apple DVD Player Help.
This article has been archived and is no longer updated by Apple.
About Apple DVD Player, version 1.3

Note: Apple DVD Player 1.3 is only available with Mac OS 9.

This document contains important information about your Apple DVD software that's not included in the printed information you received with your DVD player or the Apple DVD Player Help. It includes information about compatibility with other products, tips for using the Apple DVD Player Controller, and troubleshooting.

Contents

- **Turning off virtual memory**
- **Using the Apple DVD Player Controller**
- **Parental control**
- **Continuing after the FBI warning appears**
- **Selecting language preferences**
- **Selecting disc menu options using the keyboard**
- **Viewing quality**
- **Using the entire display**
- **Connecting your computer to an additional monitor, television, or stereo receiver**
- **Apple DVD Player and Apple Video Player**
- **Using external speakers**
- **Receiving error messages while playing a disc**
- **Compatibility issues with the Arabic version of Mac OS 8.1**

Turning off virtual memory

For optimum performance when playing a DVD disc, you should turn off virtual memory. To turn off virtual memory, use the Memory control panel.

Using the Apple DVD Player Controller

While using the Controller, keep in mind the following:

- Some DVD discs may not use all the features available on the Controller.
- You can only use Next Chapter, Previous Chapter, Scan Forward, Scan Backward, Step, and Slow Motion buttons, and the Menu button while a disc is playing.
- You cannot navigate a disc while it is paused or stopped.
- You cannot eject a DVD disc from the Finder if the Apple DVD Player application is open. To eject the disc, quit the Apple DVD Player application or use the Eject button on the Controller.
- The DVD PC-Card should not be ejected while the Apple DVD Player application is open. If the card is ejected while the Apple DVD Player application is open, you must restart your computer and insert the card, then open the Apple DVD player application to begin playing your disc.
- To move the DVD Controller, you can drag any part of the Controller except a button.
- Parts of the Controller may sparkle if it is placed over the Viewer window. To prevent this effect, hide the Controller or move it out of the Viewer window.
- Some DVD discs include instructions for using standard controls to access additional features on the disc. Following these instructions using the Controller may not work. If clicking the Next or Previous buttons does not work, first click the Play button.
- Some DVD discs may contain on screen navigation menus that may respond slowly when using the arrow-keys on the keyboard.

Parental control

You can set parental controls to any Motion Picture Association of America (MPAA) rating: G, PG, PG-13, R, NC-17. To set the parental control preferences, choose Preferences from the Edit menu and click the Parental Control tab.

If a DVD disc supports parental control, the disc will not play if its MPAA rating is for a more mature audience than the rating you selected in the Preferences dialog box.

Not every DVD disc supports parental control. If a disc does not support parental control, it will play regardless of the rating you have selected.

If you have selected parental control, some DVD discs display a message to which you must respond to play the disc.

Some DVD discs may not play unless you set the preference to the MPAA rating of the disc. For example, a disc rated G may not play although you selected PG-13 for parental control. To play the disc, set the rating of the Parental Control preference to the rating of the disc.

Continuing after the FBI warning appears

Some DVD discs use a still picture for the FBI warning. If a disc appears to pause when the FBI warning appears, press the Return or Enter key to continue playing the disc.

Selecting language preferences

Many DVD discs provide the soundtrack and subtitles in several languages. You can select the default language for the soundtrack and subtitles by choosing Preferences from the Edit menu.

Your default language preferences for the soundtrack and subtitles become effective when you start playing the disc again or when you quit and open Apple DVD Player again.

Because the soundtrack and subtitle languages provided on DVD discs can vary, the default language you select may not be available on a specific disc. In this case, use the disc's interactive menus to select a soundtrack or subtitle language.

Selecting disc menu options using the keyboard

Some DVD discs do not support making selections in the disc's interactive menus using the mouse. Buttons in the disc's menus may not highlight when the mouse passes over them or they may not respond to mouse clicks. If you cannot use the mouse to make selections in a disc's menus, use the arrow keys to highlight a button, then press the Return or Enter key to select it.

Viewing quality

For the best viewing quality for your display, choose Normal Size from the Video menu. Choosing Fill Screen from the Video menu may give acceptable viewing quality as well.

With widescreen titles, the black bars above and below the image are normal even if you choose Fill Screen.

Viewing quality is optimized for screens that are 800 x 600 pixels or larger and display 256 or more colors. If you play a DVD disc on an external monitor and the video doesn't appear, use the Monitors & Sound control panel to reduce the number of colors to 256 colors.

For optimal display of video on a television connected to a Power Macintosh G3, or the Powerbook G3 series computer, choose the "Best for Video" option from the TV Mirroring portion of the Control Strip.

Using the entire display

If you have Mac OS 8.5 installed, the Control Strip may not disappear when you choose "Present Video on Screen" from the Video menu. To hide it, open the Control Strip control panel and select Hide Control Strip.

To use the entire display to view a DVD disc, choose "Present Video on Screen" from the Video menu, then choose Fill Screen.

Connecting your computer to an additional monitor, television, or stereo receiver

DVD discs are designed to play only on a computer display, television, or monitor attached to the video output port on the computer. If the Macintosh has either an RCA (composite) or S-Video output port, DVD discs can be displayed on an external monitor or television that has a composite or S-Video input port.

Note: The cables needed to connect the computer to an external monitor or television are not provided.

The optimum resolution for viewing DVD video on a television is 720 x 480 pixels for NTSC. For PAL, it is 720 X 576 pixels.

You cannot view a DVD disc both on your computer's monitor and an external monitor simultaneously.

If you are using a Power Macintosh G3, or the Powerbook G3 series computer with TV Mirroring enabled, choose the Overscan option from the TV Mirroring portion of the Control Strip to obtain the largest possible image on your television. Changing the TV resolution will turn off Overscan

mode.

Apple DVD Player and Apple Video Player

If the Apple Video Player application is open while the Apple DVD Player is playing a DVD disc and the computer goes to sleep, you will not hear the audio for the DVD disc when you wake up the computer. To hear the audio again, open the Sound portion of the Control Strip and select the DVD option.

Using external speakers

Because soundtracks for theatrical release movies are mixed for presentation in theaters, they have a wide dynamic range and the difference in volume between dialog and sound effects may be extreme. To fully appreciate the soundtrack of such a movie when viewing it on a DVD disc, you should use an external speaker system connected to the audio output port (stereo mini-jack) or, if available, the RCA audio ports on your computer.

Note: The cables needed to connect the computer to external speakers are not provided.

You can control the volume of the audio output port using the Controller or the Control Strip.

The RCA audio ports are for use with a stereo receiver or other audio device with its own volume control. You cannot control the volume of the RCA audio ports using the Controller or the Control Strip.

You may find that stereo headphones connected to the audio output port provide an acceptable listening experience.

The computer's audio output port (stereo mini jack) can be connected to a television or stereo receiver if it has audio input ports.

Receiving error messages while playing a disc

DVD discs are susceptible to problems due to scratches, dust, and imperfections in disc manufacture. In addition, differences in disc authoring can result in errors in disc navigation. If you see an error message when playing a disc or experimenting with the features of a particular DVD disc, make sure the disc is clean and free of scratches. If you continue to see the same message, use the disc's interactive menus to select options.

Some delay is normal when using dual layer DVD discs if the disc changes to a track on a different layer.

Compatibility issues with the Arabic version of Mac OS 8.1

Apple DVD Software version 1.2 is not compatible with the Arabic version of Mac OS 8.1. To use Apple DVD Software version 1.2, use the Arabic version of Mac OS 8.5 or later.

Mention of third-party products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Apple assumes no responsibility with regard to the performance or use of these products.

About Apple DVD Player, Version 2.7

This document contains important late-breaking information about Apple DVD Player software.
This article has been archived and is no longer updated by Apple.
This document contains important late-breaking information about Apple DVD Player software. For more information, see Apple DVD Player Help. For the latest information about the Apple DVD Player software and answers to support questions, go to Apple's Support Web site at www.apple.com/support/

The following topics are covered in this document:

- About Apple DVD Player compatibility
- Disabling automatic play
- Optimizing DVD playback
- Using the Apple DVD Player Controller
- Setting parental controls
- Continuing after the FBI warning appears
- Selecting language preferences
- Selecting disc menu options using the keyboard
- About wide-screen titles
- Using the entire screen
- Using external speakers
- Increasing the volume
- Receiving error messages while playing a disc

About Apple DVD Player compatibility

- Apple DVD Player is a software-only DVD player. It is not compatible with the DVD hardware in the Power Macintosh G3, PowerBook G3, and Power Mac G4 (PCI graphics) series computers.
- Apple DVD Player is not compatible with the After Dark sleep function. Do not use the After Dark sleep function while a DVD movie is playing.
- DTS encoded discs are not supported.

Disabling automatic play

Apple DVD Player opens by default when you insert a DVD-Video disc in the DVD drive. If you don't want Apple DVD Player to open automatically when a DVD-Video disc is inserted in the DVD drive, you can use the Extensions Manager to turn off the DVD AutoLauncher extension. To do this, choose Control Panels from the Apple menu, then choose Extensions Manager from the submenu. In the Extensions list, make sure there is no X in the box next to DVD Autolauncher, then click Restart.

Optimizing DVD playback

If the audio or video playback seems to periodically stutter or pause, make sure that you quit all applications other than Apple DVD Player. It is normal for playback to pause when you use other applications and control panels, when you open menus or control strip modules, or if the Finder is busy with a task.

For optimum performance do the following:

- In the Energy Saver control panel, set the system, hard drive, and display to never go to sleep.
- In the AppleTalk control panel, open the Edit menu and select User Mode, then click Advanced. Then click the Options button and set AppleTalk to inactive.
- Disconnect your computer from the network by removing the Ethernet or other networking cable.
- If your computer has Airport, use the Airport application or control strip module to turn off Airport networking.
- Turn off Find by Content indexing. In Sherlock, open the Find menu and choose Index Volumes. Then remove the mark from the Use Schedule checkbox for all of the volumes listed.

Using the Apple DVD Player Controller

While using the Controller, keep in mind the following:

- Some DVD discs do not use all the features available on the Controller.

- You cannot navigate a disc while it is paused.
- Next Chapter, Previous Chapter, Scan Forward, Scan Backward, and the Menu button can only be used while a disc is playing.
- To move the DVD Controller, drag any area of the Controller except a button.
- Some areas of the Controller could sparkle if they are placed over the Viewer window. To prevent this, hide the Controller, move the Controller off the Viewer window, or set the color depth to thousands or millions of colors in the Monitors control panel.
- Some DVD discs contain onscreen navigation menus that respond slowly when you use the arrow keys on your keyboard.
- You cannot eject a DVD disc from the Finder if the Apple DVD Player application is open. To eject the disc, quit Apple DVD Player or click the Eject button on the Controller.

Setting parental controls

- You can set parental controls to any Motion Picture Association of America (MPAA) rating: G, PG, PG-13, R, NC-17. To set the parental control preferences, choose Preferences from the Edit menu, then click the Parental Control tab.
- If a DVD disc supports parental control, the disc will not play if its MPAA rating is for a more mature audience than the rating you selected in the Preferences dialog box.
- Not every DVD disc supports parental control. If a disc does not support parental control, it will play regardless of the rating you have selected.
- If you have selected parental control, some DVD discs display a message. You must respond to the onscreen message before the disc will play.
- Some DVD discs do not play unless you set the preference to the MPAA rating of the disc. For example, a disc rated G might not play if you select PG-13 for parental control. To play the disc, set the parental control preference to the rating of the disc.

Continuing after the FBI warning appears

If a disc appears to pause when the FBI warning appears, press the Return or Enter key to continue playing the disc.

Selecting language preferences

- Many DVD discs provide the soundtrack and subtitles in several languages. You can select the default language for the soundtrack and subtitles by choosing Preferences from the Edit menu.
- Your default language preferences for the soundtrack and subtitles become effective when you start playing the disc again or when you quit and open Apple DVD Player again.
- The default language you select might not be available on some discs. Use the disc's interactive menus to select a soundtrack or subtitle language.

Selecting disc menu options using the keyboard

With some DVD discs, you can't choose options in the disc's interactive menus using the mouse. If you cannot use the mouse to make selections in a disc's menus, use the arrow keys on your keyboard to highlight an option, then press the Return or Enter key to select it.

About wide-screen titles

With wide-screen titles, the black bars above and below the image appear even if you choose Fill Screen.

Using the entire screen

To view a movie on the entire screen, choose "Present Video on Screen" from the Video menu.

Using external speakers

- Soundtracks for theatrical release movies are mixed for presentation in theaters, so they have a wide dynamic range. The difference in volume between dialog and sound effects could be extreme. To fully appreciate the soundtrack of these movies, connect external speakers to the sound output port on your computer. For more information, see the documentation that came with your computer and the external speakers.
- You can control the volume of sound from the external speakers using the Controller or the Control Strip.
- If you like, you can also connect stereo headphones to the sound output port on your computer.
- You can listen to the audio on your television or stereo receiver. To do this, connect one end of a standard audio cable (with a stereo miniplug connector) to your computer's sound output port, then connect the other end of the cable to the audio input port(s) on the television or stereo receiver. For more information, see the documentation that came with your computer and television or stereo receiver.

Increasing the volume

To maximize volume while playing a movie, increase both the Controller volume and the Control Strip volume to the highest level. Make sure the Enable Line Mode option in the Preferences window is not selected (there is no checkmark in the checkbox).

Receiving error messages while playing a disc

- DVD discs might have problems caused by scratches, dust, and imperfections in disc manufacture. Differences in disc authoring can also cause errors in disc navigation. If you see an error message when playing a disc or experimenting with the features of a particular DVD disc, remove the disc and make sure the disc is clean and free of scratches.
- A delay is normal when changing to a track on a different layer of a dual-layer disc.

SuperDrive: Available Space Requirements for DVD-R Data

This document discusses the space requirements on the hard disk when burning a DVD-R data disc in the Mac OS X Finder.
This article has been archived and is no longer updated by Apple.
Your hard disk sets aside a temporary copy of the data in the DVD desktop image before you burn the DVD. You must have enough available space on your hard disk and on the DVD-R disc for the data you want to burn. To determine space available, select your hard disk or DVD-R disc image, then choose Show Info or Get Info from the File menu.
Note: Your computer may have either Show Info or Get Info, depending on which version of Mac OS X you are using.

Use DVD-R General media with a 4.7 GB media capacity.

When handling discs, be careful not to leave fingerprints, place other materials on the discs, or add labels to the discs that may cause them to become unbalanced when spinning.

Power Mac G4 (QuickSilver 2002): How to Replace The Battery

This document lists the steps for replacing the battery in the Power Macintosh G4 (QuickSilver 2002).
This article has been archived and is no longer updated by Apple.

Warning
Apple recommends that you have an Apple-certified technician install memory, PCI expansion cards, and internal storage devices. Consult the service and support information that came with your computer for instructions on how to contact an Apple authorized service provider or Apple for service. If you install these items yourself, you risk damaging your equipment, and such damage is not covered by the limited warranty on your computer. See an Apple authorized dealer or service provider for additional information about this or any other warranty question.

Replacing the Battery

Your computer has a 3.6 V lithium battery installed on the main logic board. Some signs that you need to replace the battery are intermittent problems starting up the computer and random changes in its date and time settings. You can purchase a replacement battery from an Apple-authorized dealer.

1. Open the computer. See technical document 42687 "**Power Mac G4 (QuickSilver 2002): How to Open the Computer**" for steps to open the computer.

2. Remove the battery from its holder, noting the orientation of the battery's positive end. (A plus sign is marked on and near the battery holder). See Figure 1.

   - Remove the battery by pulling it up and out of its holder. You may need to spread these two tabs slightly apart to release the battery. Spread the tabs gently so they don't break.
   - **Important**: Batteries contain chemicals, some of which may be harmful to the environment. Please dispose of used batteries according to your local environmental laws and guidelines.

3. Insert the new battery in the holder, making sure the battery's positive symbol aligns with the positive symbol on or near the holder.
   - **Warning:** Installing the battery incorrectly may cause an explosion. Be sure the battery's positive and negative poles are correctly oriented in the holder. Use only the same type of battery or an equivalent recommended by the manufacturer of the original.

4. Close the computer

Warning: Never turn on your computer unless all of its internal and external parts are in place and it is closed. Operating the computer when it is open or missing parts can damage your computer or cause injury.

Mac OS 9: About PPP Over Ethernet

This document discusses what is necessary to use PPP over Ethernet (PPPoE) with Mac OS 9.

This article has been archived and is no longer updated by Apple.

Mac OS X has PPP over Ethernet (PPPoE) capabilities built-in. If you startup the computer using Mac OS 9 and want to connect to the Internet and your ISP requires PPPoE, then you will need to obtain PPPoE software from your ISP. One example of PPPoE software is discussed in technical document 60645 "**Mac OS 9: Is Compatible With MacPoET 1.1**."

If you are unable to acquire the PPPoE software and have an AirPort Base Station, then you may still be able to connect under Mac OS 9. AirPort 1.3 and later does support PPPoE. However, if you do not have the Mac OS 9 PPPoE software then the AirPort Base Station must be configured under Mac OS X first.

SuperDrive: About rewriteable DVD discs

This article has been archived and is no longer updated by Apple.

There are three formats for rewritable DVD discs: DVD-R/DVD-RW, DVD+RW, and DVD-RAM.

DVD-R and DVD-RW

DVD-R is a single-writeable format (similar in nature to CD-R). DVD-RW is a rewriteable format (similar in nature to CD-RW). DVD-RW has a read-write capacity of 4.7 gigabytes per side. It can be rewritten up to about 1000 times. Both DVD-R and DVD-RW were developed and approved by the DVD Forum (http://www.dvdforum.org), of which Apple is a member.

The SuperDrive can use both DVD-R and DVD-RW discs. Mac OS X can write to DVD-R General Media discs, which are not rewriteable. Roxio's Toast 5 Titanium and Charismac's Discribe 5 can write to DVD-RW discs. Contact Roxio and Charismac for additional information.

Once written, DVD-R and DVD-RW discs can be used in many different drives and players. DVD-R media burned with Apple SuperDrives are compatible with a wide variety of DVD players. Check with the manufacturer of, or consult the documentation which came with, your player to find out if it is compatible with DVD-R media.

DVD+RW

DVD+RW is a rewriteable format of similar capacity to DVD-RW, but was developed separately by the DVD+RW Alliance (http://www.dvdrw.com/).

Note: Some earlier Apple SuperDrives cannot write to DVD+RW discs. To find out what kinds of discs your drive can burn to, use System Profiler--for Mac OS X 10.3.x steps click here, for Mac OS X 10.4.x steps, click here.

System Profiler in Mac OS X 10.4 displays an Apple SuperDrive capable of burning to DVD+RW

DVD-RAM

DVD-RAM can be thought of as a large capacity floppy or Zip disk as it is has random read-write access. The disc is part of a cartridge and is available in 2.6 GB and 4.7 GB single-sided and 5.2 GB and 9.4 GB double-sided capacities. It can be rewritten more than one hundred thousand times. DVD-RAM was developed by the DVD Forum separately from the release of DVD-R and DVD-RW. Prior to the release of the SuperDrive, some Power Mac G4 computers shipped with a DVD-RAM drive.

While some DVD-RAM discs can be removed from the cartridge, those discs cannot be read by or written to using the SuperDrive.

Mac OS X Server: Share Points in the Administrator‘s Desktop Folder are Not Accessible by FTP or SMB Clients

Share points created in the administrator's Desktop Folder are not accessible by FTP or SMB clients.
This article has been archived and is no longer updated by Apple.

Symptom

When an administrator creates a share point in the Desktop Folder, an FTP or SMB client cannot access it. FTP clients will see a "Permission denied" alert message when trying to access it. Microsoft Windows users will see a message indicating that the network name cannot be found.

Note: Users accessing the same share point over AFP are not affected.

Solution

Move the share point into the Shared Items folder located at the top (root) level of the startup disk.

To move the share point, follow these steps:

1. Deselect the "Share this item and its contents" option in the Sharing pane in the Mac OS X Server Admin application and save your settings.
2. Drag the share point to the Shared Items folder
3. In the Sharing pane, select the "Share this item and its contents" option and save your settings.

For more information on creating a share point, see page 36 of the Mac OS X Server Admin Guide.

Mac OS 9: Network Services Location Manager Admin Guide

This document describes the Network Services Location Manager and tells you how to set up your network to take advantage of it.
This article has been archived and is no longer updated by Apple.
Network Services Location Manager Network administrator's guide

This document describes the Network Services Location Manager and tells you how to set up your network to take advantage of it. You should read this document if you are a network administrator or are responsible for setting up or managing network services.

What Is the NSL Manager?
The Network Services Location (NSL) Manager is software that allows applications to advertise and search for network services. In the past, there was no easy way to □nd services on a TCP/IP network unless the network administrator identi□ed or listed those services in some way. For example, an administrator might put links to public Web sites on a home page, or let users know about private servers by word of mouth.

The NSL Manager now provides both a way for network services to advertise themselves and a way for applications that require network services to find them automatically. When asked to locate network services by an application, the NSL Manager can use several different protocols to quickly search for and provide a list of available services. The search takes place with a minimum of network traffic. Located services are grouped into network "neighborhoods" based on the network segment in which the services are found and the service location protocols operating in that segment, as represented by NSL plug-ins.

What Computers Have the NSL Manager?
The NSL Manager is available on all computers with a PowerPCTM microprocessor and Mac OS 8.5 (or later) installed. To make sure all the computers on your network can take advantage of the NSL Manager's service advertising and search capabilities, see the section "Setting Up Your Network to Work With the NSL Manager," later in this document.

About NSL Plug-Ins
When the NSL Manager receives a request to advertise or locate a network service, it passes it on to an NSL plug-in that performs the actual registration or search. An NSL plug-in is an extension that makes itself available to the NSL Manager when the NSL Manager is initialized, but resides in memory only when it is responding to a request. You can use the Extensions Manager to enable and disable individual NSL plug-ins.

When the NSL Manager is initialized, each NSL plug-in provides it with the following information: the types of services the plug-in can search for, such as HTTP and FTP; and the protocol the plug-in uses to conduct searches, such as DNS or LDAP.

With Mac OS 9, NSL Manager version 1.1 is accompanied by four plug-ins: Domain Name Service (DNS), Service Location Protocol (SLP), Lightweight Directory Access Protocol (LDAP), and Name Binding Protocol (NBP). Additional NSL plug-ins may become available from Apple Computer, Inc. or third-party developers.

Setting Up Your Network to Work With the NSL Manager
The way you set up your network can affect which services the NSL plug-ins can locate, so you may need to make adjustments to allow hosts to find specific network services. Read the following sections for more information.

Setting Up for DNS Searches
In order for the DNS plug-in to access information about network services, your DNS server must be configured to allow anyone to request and receive zone transfers.

To make network services available to the NSL Manager through the DNS plug-in, you need to manually add text records for network services to the DNS server. The format of the records is as follows:

```
<hostname> <TTL> TXT <URL>
```

The following table explains each element of the record.

Field	Contents
<hostname>	The name of the host being referenced
<TTL>	The time-to-live for this information
<URL>	The complete URL for this host (for example, http://www.apple.com/)

If you use more than one DNS server, make sure you add records for a particular host name to the server responsible for that host and add the names of these servers to the search domain lists in clients' TCP/IP configurations.

Setting Up for SLP Searches and Registrations
The NSL Manager uses the SLP plug-in to find and advertise network services using the Service Location Protocol.

Network services running on the Mac OS can use the NSL SLP plug-in to advertise their availability. (File sharing and Personal Web Sharing, for

example, use SLP registration.) SLP service agents are created on the host computer by the SLP plug-in, then these service agents listen for NSL search requests and respond appropriately. On networks that include an SLP Directory Agent (DA) server, the SLP service agents register their services with the DA. NSL search requests are then made directly to the DA, thereby reducing network traffic. (Most of this traffic is on the local subnet.)

For SLP registration and discovery to take place, the advertising and searching hosts must be running the same version of the SLP plug-in. Services advertised by version 1.0 of the plug-in cannot be found by hosts running version 1.1. Similarly, services advertised by version 1.1 of the plug-in cannot be found by hosts running version 1.0.

To register or discover services outside the local subnet, IP Multicast Router capability must be enabled. Note that MacIP does not support multicasting. When advertising a service, the SLP plug-in follows these steps to decide which network neighborhood (SLP scope) to register the service in:

- If the registering application or service specifies a network neighborhood, the SLP plug-in registers the service in that neighborhood.
- If no neighborhood is provided by the registering application or service, the SLP plug-in registers the service in the first domain listed in the Search Domains list of the host's TCP/ IP settings.
- If no search domain is specified in the host's TCP/IP settings, the plug-in tries to derive a neighborhood from the domain of the service's URL. For example, a service with the URL http://me.mydomain.com would be registered in the neighborhood mydomain.com and http://me.sub.mydomain.com would be registered under sub.mydomain.com.
- If none of these steps yields a neighborhood, the plug-in registers the service in the "default" SLP scope, which is listed as the "Local Services" neighborhood (or the localized equivalent).

Setting Up for LDAP Searches
The LDAP plug-in always searches the LDAP server and associated searchbase specified in the LDAP Services fields in the Hosts settings on the Advanced tab of the Internet control panel. Services discovered in this default directory are listed in a neighborhood that has the same name as the LDAP server.

Applications and users can request the plug-in to search additional LDAP directories. Using the Network Browser, for example, a user can browse an LDAP directory by adding a neighborhood that has the same name as the server, in this form:
`<servername>%2f<searchbase> (ldap.domain.com%2fc=us, for example)`

Note: Choosing an item from the Favorites list in the Network Browser causes all active NSL plug-ins to perform a search. So, when a user chooses an LDAP server from the Favorites list, the DNS plug-in might also respond, generating a "nameserver not responding" message. If DNS browsing is not needed, the user can disable the DNS plug-in using the Extensions Manager control panel.

If a user adds an LDAP neighborhood without including a searchbase in the name, the LDAP plug-in makes two attempts to get data from the server. First, it tries to access the directory without specifying a searchbase. (Version 3 LDAP servers can return data when no searchbase is provided.) If that fails, the plug-in tries again using a searchbase of c=us. For example, if a user adds a neighborhood named ldap.mydomain.com, the plug-in tries these searches:

- ldap://ldap.mydomain.com
- ldap://ldap.mydomain.com/c=us

When you set up an LDAP directory to advertise services to NSL, keep these points in mind:

- The plug-in looks for service URLs (afp://asip.mydomain.com, or http://www.mydomain.com, for example) in both `labeleduri` and `url` attributes. For best results, use the `labeleduri` attribute. See RFC 2079 for more information.
- The directory tree is displayed using distinguished names. When possible, use attributes and names that are easy for a user to interpret, like `cn=Joe Smith`, rather than less revealing names like `userID=123456789`.
- If practical, you can improve performance and readability by organizing the directory tree so that service lists contain fewer than 200 entries. The searchbase
  ```
  ou=printers, o=school
  ```
  can, for example, be restructured as
  ```
  service=printers, ou=HumanitiesBldg, o=school
  service=printers, ou=ScienceBldg, o=school
  service=printers, ou=AdminBldg, o=school
  ```
- You can create a separate branch in the directory specifically for NSL browsing (for example, `ldap.mydomain.com/ou=nsl,c=us`).

Setting Up for NBP Searches
If AppleTalk is active on a host, AppleTalk zones and AppleShare servers on the network are listed in the neighborhood named "AppleTalk." Security Issues The NSL Manager makes network services that were once difficult to find more readily available to network users. It does not, however, make sites less secure; it just makes it easier for clients to find services that were already available.

If you use DNS to list your intranet's services, you control which services clients can discover through NSL searches. However, any network services that utilize SLP registration are discoverable by the NSL Manager.

Apple DVD Player requires an internal DVD drive

Apple DVD Player works with the internal factory-installed DVD drive but will not work with external DVD drives.

This article has been archived and is no longer updated by Apple.

To view movies on a DVD-Video using Apple DVD Player (Mac OS 9) or DVD Player 3.x (Mac OS X) you must have an internal DVD drive. Licensing restrictions of the DVD decoding technology prevent its use with computers that do not come with an internal DVD drive.

Computers that come with an internal CD-ROM or CD-RW drive and are not able to read DVD discs are restricted from viewing movies on DVD-Video discs using Apple DVD player. A "-70012" alert may appear if you try to play a DVD movie disc with an external player.

Adding an external DVD drive allows a computer to use DVD-ROM discs, but the Apple DVD Player application is still restricted from playing DVD-Video discs.

See "DVD Player 3.0.1: Compatible Computers" for information on the computers compatible with DVD Player 3 for Mac OS X.

Mac OS X Server 10.0 and Later: How to Change New User‘s Home Folder Contents

This document describes how to change the template that is used when creating a user's home folder and its contents in Mac OS X Server 10.0 and later.
This article has been archived and is no longer updated by Apple.
In Mac OS X Server, a user's home folder is created with the following default folders:

- Desktop
- Documents
- Library
- Movies
- Music
- Pictures
- Public
- Sites

Not all users require these folders. You may want to change the template to reduce the amount of unnecessary folders and files, or to add custom applications and files.

The following steps explain how to edit the UserTemplate folder for each new home folder created. Please note that this procedure affects Mac OS X users only. Computers that use Mac OS 9 or Macintosh Manager will not behave the same as computers with Mac OS X.

1. Log in as the root user.
At the login screen, log in as the user 'root' with your Admin user password.

2. Go to /System/Library/UserTemplate.
Choose Go to folder from the Go menu then type "/System/Library/UserTemplate/" and click Go.

3. Open the localized folder for your location.
For English, double-click the file name "English.lproj" to open up the user's Home folder template for English home folders.

4. Edit the template folder to meet your needs.

- If you want to streamline the user's Home folders, you can delete folders that you don't need. Deleting certain folders may reduce Mac OS X's features. For example, deleting the Sites folder means users will not have a Web site in their home folder unless they create one.
- If you want to add folders, files or applications, you can create the files and folders appropriately. Note that items you add here will be duplicated in every new user's home folder, so if you add many files or applications or even a few large files or applications, you may need to expand the server's storage capacity.
- If you want to edit the default Web site for new users, create your default Web site and place it in the Sites folder. Make sure the index file is named 'index.html' so Apache will find it.

5. Create a new user and test.
Create a new user then look in their home folder. The contents should be an exact copy of the template. If it is not, make sure you edited the correct localized version of your UserTemplates folder.

Mac OS X: When Services Are Available

This document discusses when items in the Services submenu under the Application menu may be available.
This article has been archived and is no longer updated by Apple.
In Mac OS X, some applications provide "services" that let you quickly use content from one application with another application. The content may include text, graphics, pictures, or movies.

The services appear under the Application menu in the Services submenu. (See Figure 1.) The Application menu assumes the name of the current application.

Figure 1 Application and Services menus for Stickies

In some cases, the active application may not work with all or some services.

For example: The services for Grab are available in Stickies and TextEdit but are dimmed for Terminal because Terminal is not able to accept the graphic data from Grab.

In other cases, specific services may appear dimmed or not available. For example, TextEdit will be dimmed when in Stickies if there is no text selected. A particular service may also be dimmed if you have selected content that doesn't work with the service.

iBook: DVD Player Shows No Video if VGA Display Adapter Is Plugged in and No External Display Is Connected

DVD Player may have no video if the VGA Display Adapter is plugged into the RGB video port and there is no external display connected.
This article has been archived and is no longer updated by Apple.

Symptom

DVD Player plays audio, but does not display any video.

Solution

- Connect a monitor to the VGA port on the adapter.

or

- Disconnect the adapter from the computer.

Mac OS X Server 10.1: How to Enable CGI Scripts for Individual User Sites

This document discusses how to enable Common Gateway Interface (CGI) scripts for individual user Web sites located in the user's Home directory using Mac OS X Server 10.1 or later.
This article has been archived and is no longer updated by Apple.
1. Log in to the server as root or sudo to root in the terminal if you prefer to use a command line editor.

2. Using TextEdit (or terminal based text editor such as vi) open /etc/httpd/httpd.conf

Note: You can return to the original httpd.conf file if necessary by duplicating and renaming either the httpd.default or httpd.bak file located in the same directory.

3. Edit the line that reads
"AllowOverride None"
to read
"AllowOverride Options"
This line is about 1/4 of the way through the document. See Figure 1 below for a sample. Save the changes.

Figure 1 Editing httpd.conf file

4. Create a new file in the text editor.
Type: Options +ExecCGI
Save the file in the top level of the user's Sites folder.
Name the file:
.htaccess
(You must include the period as the first part of the file name.) The relative pathname should be: user/Sites/.htaccess

5. Copy and rename the test-cgi file from
/Library/WebServer/CGI-Executables/
to
/Users/user/Sites/test-cgi.cgi

Note: In order for CGI scripts outside of the CGI-Executables directory to run, they need to have the .cgi filename extension. The test-cgi provided does not have the execute bit set. You will also need to set the execute bit for the script to actually run. See technical document 106519 "**Mac OS X: How to Troubleshoot Errors When Running CGIs**" for additional information.

6. Test the script by pointing a browser to http://server.name.com/~user/test-cgi.cgi

This document is intended to supplement the Server Admin Guide. Please direct all questions regarding this article to the developer site at http://developer.apple.com or the discussion boards.

FireWire Target Disk Mode: Target Computer Shuts Down at Startup

FireWire target disk mode requires the target computer to have an ATA hard drive at ATA bus 0.

This article has been archived and is no longer updated by Apple.

Symptom

When you try to start up the target computer, it makes its startup sound, but then shuts down. No video appears on the screen, nor does the FireWire icon. The computer starts up normally without the T key held down.

Solution

Make sure the target computer has an ATA hard drive on ATA bus 0. It is normal for a target computer to shut down if it does not detect an ATA hard drive on ATA bus 0.

All later Macintosh computers come with an ATA hard drive at ATA Bus 0 in their default configurations. However, it is possible to custom order (CTO) a Macintosh that does not.

Power Mac G4: How to Differentiate Between Models, Part 2

This document compares features of and helps identify the Power Mac G4 computers introduced after July 2001 including the Power Mac G4 (QuickSilver, QuickSilver 2002, Mirrored Drive Doors, and FW 800).
This article has been archived and is no longer updated by Apple.
This document compares features of the Power Mac G4 computers introduced after July 2001. For earlier Power Mac G4 computers see technical document 58418 "**Power Mac G4: How to Differentiate Between Models**"

Feature	Power Mac G4 (QuickSilver)	Power Mac G4 (QuickSilver 2002)	Power Mac G4 (Mirrored Drive Doors)	Power Mac G4 (FW 800)	Power Mac G4 (Mirrored Drive Doors 2003)
Graphics Card	NVIDIA GeForce2 MX NVIDIA GeForce3	RADEON 7500 NVIDIA GeForce4 MX NVIDIA GeForce4 Titanium	NVIDIA GeForce4 MX RADEON 9000 Pro NVIDIA GeForce4 Titanium	NVIDIA GeForce4 MX RADEON 9000 Pro NVIDIA GeForce4 Titanium ATI Radeon 9700 Pro	RADEON 9000 Pro NVIDIA GeForce4 Titanium
Wireless Networking	Yes (note 3)	Yes (note 3)	Yes (note 3)	Yes (note 3, 4)	Yes (note 3)
Video Connector	ADC and VGA	ADC and VGA (dual display capable)	ADC and DVI (dual display capable) DVI to VGA adapter included (See Note 5)	ADC and DVI (dual display capable) DVI to VGA adapter included (see Note 5)	ADC and DVI (dual display capable) DVI to VGA adapter included (see Note 5)
Optical Drive Type	Tray Loading	Tray Loading	Tray Loading	Tray Loading	Tray Loading
DVD Decoding	Software	Software	Software	Software	Software
Bluetooth ready	With optional USB adapter	With optional USB adapter	With optional USB adapter	With Optional Internal card	With optional USB adapter
FireWire ports	Two FireWire 400	Two FireWire 400	Two FireWire 400	One FireWire 800 Two FireWire 400	Two FireWire 400
Modem	v.90 Unique to Power Mac G4 (QuickSilver) - (see Note 6)	v.90 Unique to Power Mac G4 (QuickSilver 2002) - (see Note 6)	v.92 Unique to Power Mac G4 (Mirrored Drive Door) - (see Note 6)	v.92 (see Note 6)	v.92 (see Note 6)
Model Numbers	M8493	M8493	M8570	M8570	M9145, M9309

The simplest way to differentiate the Power Mac G4 (Mirrored Drive Doors) and the Power Mac G4 (FW 800) is by looking at the FireWire ports. The FW 800 will have three FireWire ports while the Mirrored Drive Doors model will have two (see Figure 1).

Figure 1 Rear ports of Power Mac G4 (FW 800)

Technical Features Differences

The following table compares the Power Mac G4 models.

Feature	Power Mac G4 (QuickSilver)	Power Mac G4 (QuickSilver 2002)	Power Mac G4 (Mirrored Drive Doors)	Power Mac G4 (FW 800)	Power Mac G4 (Mirrored Drive Doors 2003)

Notes

1. L2 or L3 cache levels stated are per processor on dual processor configurations.

2. The system software CDs are specific to each model computer. You should use the system software CD that came with your computer to make sure the appropriate software is installed.

3. Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**."

4. Power Mac G4 (FW 800) computers require the AirPort Extreme card, but can connect to a standard AirPort or AirPort Extreme Base Station (see technical document 107372 "**AirPort Extreme: Compatibility With Earlier AirPort and Third-Party 802.11b Wireless Products**"

5. Second Apple flat-panel display requires Apple DVI to ADC Adapter, sold separately.

6. Appropriate ISP and telephone services required. Your ISP may not support all V.92 features. Modem will function according to V.90 standards if V.92 services are not available. Actual modem speeds lower.

Mac OS X Mail: About Secure Email Communications (SSL)

Security of the Mail application in Mac OS X may be enhanced by enabling Secure Socket Layer (SSL) mail, which gives additional security to email communications.
This article has been archived and is no longer updated by Apple.
Securing Email Communications with Mac OS X Mail

This document explains how you can better secure your email communications between the mail server and your computer.

Why Should I Use SSL with Mail?

With enough time and effort, any person monitoring your network could capture "cleartext" (unencrypted data) traveling out of it. While there are programs like PGP that encrypt the body of an email message, your email server authentication data (including the login and password) are not encrypted by these tools. Given the amount of authentication-related information likely to be traveling over your network in cleartext at any one time, turning as much information from cleartext into "ciphertext" (encrypted data) is often preferred.

There are many ways to prevent cleartext throughout your network, and with the expanded capabilities of Mac OS X Mail application (Mac OS 10.1.3 and later)- you have an additional option. If your mail server or Internet service provider (ISP) is compatible with it, the option exists to encrypt the email traffic (including authentication data) between your computer and the mail server using SSL.

SSL has components to it called POPS and IMAPS, which correspond to the POP and IMAP protocols for receiving mail. POPS and IMAPS are similar in their nature to HTTPS, commonly seen in securing Web pages. The additional "S" at the end corresponds to "secure." Using SSL helps prevent unauthorized access to your administrative and user data.

Who Uses It?

- Organizations who have networks that are fairly open, due to the nature of the organization- like college campuses, for example, often use Mail with SSL.
- Any users who have sensitive data or are concerned about unauthorized access to their mail or other accounts are also likely to use SSL in the Mail application.

ISP Mail Server Setup
Before setting up Mail to work with SSL, make sure your mail server has the ability to do this. Many ISPs will often have this option available to you. You should contact your ISP to find out if SSL mail (POPS/IMAPS) is an option, and if so, which port should be used.

The default SSL ports for POPS and IMAPS are:
POP: 995
IMAP: 993

The default non- SSL ports for POP and IMAP are:
POP: 110
IMAP: 143

Setting up Mail for SSL

Important: These steps require Mac OS X 10.1.3 or later.

1. Open the Mail application.
2. Choose Preferences from the Mail application menu.
3. Click Accounts.
4. Select an account name, and click Edit.
5. Click the Account Options tab.
6. Click the Use SSL checkbox to enable this option.

Selecting the checkbox will auto-populate the default port numbers. If there is a non-default port number already present, it will not change. You can manually enter a number if your ISP gave you a different port number. Be sure you enter the correct port for your mail server here when selecting SSL, even if it auto-populates a default number.

Note: If SSL is accidentally set up when it should not be, or is configured using the incorrect port for your mail server, an alert box with a message similar to this may appear:

> "Fetch Error: Couldn't connect to a POP host name mail.apple.com."

Security Enhancements with Mac OS X 10.1.5

Mac OS X Update 10.1.5 adds extra security when using SSL with Mail. If Mail is configured to attempt to use SSL with a mail server that does not offer a secure connection, the account will go offline after attempting to connect. Uncheck the SSL option to use the account.

If you are not using Mac OS X 10.1.5, please see technical document 106704, "**Mac OS X: How to Update Your Software**".

Power Mac G4 (Mirrored Drive Doors): Must Use Line-Level Audio Input

You can input sound into your computer from audio equipment, including line-level devices such as an amplified or self-powered microphone.
This article has been archived and is no longer updated by Apple.
The Power Mac G4 (Mirrored Drive Doors) computer has a line-in stereo sound input port on the back panel. The audio inputs are designed to accept high-level audio signals: 2 Vrms or +8 dbu, which is the standard output level from CD and DVD players. Low level consumer products operating below -10 dbu require a pre-amplifier. The output level of some consumer audio devices is lower, often 0.1 Vrms or -10 dbu. Sound recordings made on the Power Mac G4 with such low-level devices have more noise than those made with high-level devices.

Examples of devices that provide line-level input include:

- CD players
- tape decks
- self-powered microphones
- DVD players

Note: While the Apple PlainTalk mic included with earlier Power Macintosh computers does provide line-level input, it does not use a standard 3.5 mm stereo miniplug, and cannot be used with the Power Mac G4 (Mirrored Drive Doors) audio line-in port.

The earlier Apple Omnidirectional microphone will also not work, because it provides mic-level input instead of the required line-level input.

Check the specifications of the sound input device you are connecting to determine if it provides the proper line-level input.

Griffin Technology's iMic adapter allows the use of most mic-level sound input devices. Contact Griffin for additional compatibility information.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Power Macintosh G3: Finder Does Not Open After Starting up in Verbose Mode

The Finder will not open ("load") if you start up the computer in verbose or single-user mode with Mac OS X 10.2.2.

This article has been archived and is no longer updated by Apple.

Symptom

If you start up the computer in verbose mode, or if you start up the computer in single-user mode and type "exit" at the command line, the Finder will not open. Instead, a gray screen appears after all of the "verbose" startup messages have finished scrolling.

Solution

Update the computer to Mac OS X 10.2.3.

Published Date: Feb 20, 2012

Mac OS X: Numeric Keypad Does Not Respond

This document describes a situation where the numeric keypad does not respond in Mac OS X applications.
This article has been archived and is no longer updated by Apple.

Symptom

Typing numbers using the numeric keypad does not work, but the Key Caps utility indicates that the keys are being pressed. Holding down the Shift key allows the numeric keypad to work correctly.

Solution

1. Choose System Preferences from the Apple menu.
2. Choose Universal Access from the View menu.
3. Click the Mouse tab.
4. Turn off "Mouse Keys". If Mouse Keys is already off, turn it on and off again.

Note: Mouse Keys could be turned on inadvertently if certain programs (most notably games) make use of the Option key. Pressing Option five times in a row is the keyboard shortcut for turning on Mouse Keys. You can avoid this by deselecting the "Allow Universal Access Shortcuts" checkbox at the bottom of the Universal Access pane.
Published Date: Feb 20, 2012

Power Mac G4: Some Programs May Need to Be Updated to Work With More Than 1.5 GB of RAM

Unexpected results may occur with some applications on a Power Mac G4 computer that has more than 1.5 GB of installed random-access memory (RAM). Updating the software or reducing the amount of RAM to 1.5 GB or less should resolve the symptoms.
This article has been archived and is no longer updated by Apple.

Symptom

Application programs may not recognize the installed memory correctly and may report that more memory is required. One example alert is "This system does not have enough memory." Applications may quit unexpectedly or produce other errors that are resolved if you reduce the amount of installed memory to 1.5 GB or less.

Solution

Mac OS X allows Macintosh computers with four memory card (DIMM) slots that can accommodate 512 MB DIMMs to utilize more than 1.5 GB of memory. Some software, including both applications and installers, may not be able to recognize the additional memory, or incorrectly report that only a minimal amount of memory is installed.

The computer and Mac OS X are operating correctly. A change in Mac OS X to attempt to correct this would likely cause applications that are working correctly to behave in unexpected ways.

Possible steps to resolve the issue:

- Contact the software developer to see if there is an updated version of the software available or get other recommendations.
- For installers, some may have only a Quit option while others may also include an option to "Install anyway." Try choosing "Install anyway" if it is an available option.
- Some software may come with an installer that works in Mac OS 9 and Mac OS X. If this is the case, and it's the installer that is producing the alert, try installing while the computer is started up with Mac OS 9. Depending on the software, you may be able to use the software in Mac OS 9 and Mac OS X.
- While waiting for a software update to be available, temporarily removing a DIMM may be necessary to use or install the software.
- If the software can also work in Mac OS 9, then it may work when started in Mac OS 9 or possibly as a Classic application (if the Get Info window has a checkbox to "Open in the Classic environment").

Mac OS X 10.2: Mail - How to Import Mail From a Backup

This document explains how to import mail that has been backed up using Mac OS X 10.2 or later.
This article has been archived and is no longer updated by Apple.
If you backed up your mailboxes using Mac OS X 10.2 or later, you can import your mailboxes into Mail via one of two methods:

Method 1

1. Open the Mail application.
2. Choose Import Mailboxes from the File menu.
3. Choose either Mail for Mac OS X or Standard mbox files depending on the method you used to back up (Figure 1)
4. Navigate to the location of your backed up mailboxes and select the folder where the backup of your mailbox is located.
5. Mail will list all of the available mailboxes that can be imported from the selected directory. Check the mailboxes to import, and click the forward button to import the mailboxes.

Figure 1 Choose Mail for Mac OS X or Standard mbox files

Method 2

Note: This method can only be done if you have reinstalled Mac OS X 10.2 and have not configured Mail.

1. Drag the backup mailboxes to the Users home mail folder (~/Library/Mail).
2. Drag your old Mail preferences file "com.apple.mail.plist" that was part of your backup, into the Users preferences folder (~/Library/Preferences).

Published Date: Feb 20, 2012

Power Mac G4 (Mirrored Drive Doors): Increased Noise Levels Expected

Increased noise levels are expected with dual processor computers.
This article has been archived and is no longer updated by Apple.
The sound generated by Power Mac G4 (Mirrored Drive Doors) computers is approximately equivalent to previous dual processor computers. Users who upgrade from earlier, single processor computers might notice that the computer is louder. This is because there are more parts to cool--multiple processors and additional expansion capabilities--within the same form factor.

However, Apple has found that there are some situations that may lead to increased sound levels beyond what is expected.

One is addressed with the 4.4.8 version of the firmware (BootROM) for your computer. See software download document 120171 "**Power Mac G4 Firmware Update: Information and Download**" if you have an earlier version. You can tell which version of firmware your computer has by using Apple System Profiler.

Other situations include the processor fan constantly spinning at high speed, and a clicking sound that comes from the computer's power supply. In both of these cases, contact an Apple Authorized Service Provider (AASP) to determine if your computer is affected by either of these symptoms. Apple has directed AASPs on how to address affected computers.

Final Cut Pro 3: About Sync Adjust and Irregular Audio Rates in DV Clips

This document discusses why a DV clip may have an audio sample rate that differs slightly from the rate specified in Capture Settings.

This article has been archived and is no longer updated by Apple.

Many DV camcorders and decks record audio at sample rates other than the true sample rates of 32 kHz or 48 kHz. Variations in equipment from different manufacturers result in slight, but significant variances from these standard sample rates.

QuickTime expects the sample rate of incoming audio to be exactly 32 kHz or 48 kHz. The discrepancy between the sample rate used by your DV video equipment and the expected sample rate in QuickTime may cause a drift in audio and video sync in your captured clips over many minutes of playback. How noticeable this drift is depends on the DV camcorder or deck you're using.

To avoid this issue in Final Cut Pro and to ensure you have accurate sync in all captured DV clips, make sure you turn on the Sync Adjust Movies Over _ Minutes option in Preferences. When turned on, this option forces Final Cut Pro to count the samples of the audio tracks of all DV clips after they've been captured to determine the sample rate at which they were originally recorded. With the original sample rate determined, Final Cut Pro can then ensure accurate sync no matter how long your captured clip.

Since drifts in sync typically occur in clips with a long duration, you can specify the number of minutes in a clip when this feature should be used. The default value of five minutes is adequate in most cases. When this feature is used by Final Cut Pro, the new sample rate information for your clip is stored in your Final Cut Pro project file, not in the source QuickTime file for this clip on disk. It does not alter the source file in any way. When looking at your clips in the Browser, you can tell if this feature has been used if the Aud Rate column displays an uneven value for your clip. For example, instead of displaying a sample rate of 48.0 kHz for your clip, a sample rate of 48.0258 appears.

Note: There are two types of items with which you shouldn't use the Sync Adjust Movies setting: non-DV clips and clips with timecode breaks.

- Non-DV clips: Clips that you capture from non-DV sources, such as analog tape or from digital sources via SDI, don't have varying sample rates. However, because lost A/V sync due to timecode breaks is still a risk, you should disable the Sync Adjust feature if you're not capturing from a DV source.
- Clips with timecode breaks: Any timecode break, or gap, in the signal recorded to tape results in an invalid sample count if the Sync Adjust feature is enabled. As a result, the A/V sync of this type of clip is lost. The only way to restore sync is to record the clips that come before and after a timecode break separately.

Mac OS X 10.2 - 10.2.8: How to print your addresses from Address Book

This article has been archived and is no longer updated by Apple.

This document describes how to print data contained in the Address Book application that comes with Mac OS X 10.2.x. For Mac OS X 10.3 or later, see the following documents:

- Address Book 3.1.1 Help: Printing address labels and lists
- AddressBook 4.0 Help: Printing lists

The Print dialog for Address Book has two application specific options available for printing: Phone list and Email list.

Phone list will print the names and phone numbers of the selected records. Email list will print the names and email addresses of the selected records.

To access these options follow these steps:

1. Open the Address Book application.
2. Choose **File** > **Print**.
3. Choose **Address Book** from the **option categories** pop-up menu.
4. Choose either **Phone list** or **Email list** from the **Print** pop-up menu.

If you need to print a complete record of the Address Book data, then follow one of these three methods:

Method 1

1. Open Address Book.
2. Choose **View** > **Card and Columns**.
3. Select any name. **Note:** You can narrow the names printed by creating a group first, then selecting the group and then a name in the group.
4. Choose **Edit** > **Select All**.
5. Choose **File** > **Export vCards**.
6. Type a name for the file in the Save field, navigate to the place you want to save the file to and click Save.
7. Open TextEdit and choose **FIle** > **Open**.
8. Locate the file you saved in step 5 and click Open.
9. Choose **File** > **Print**.

Method 2

- If you already have a program that accepts vCard input, do steps 1-5 in Method 1 and then follow the program's instructions on how to import vCard data.

Method 3

- A third-party utility called iDress is available from Incarna **http://www.incarna.com/**. iDress provides a variety of printing templates for Address Book.

Mac OS X: Disk Whose Name Begins With a Period Is Not Available in Finder

A disk or volume whose name begins with a period is not available in the Finder.
This article has been archived and is no longer updated by Apple.

Symptom

A disk or volume whose name begins with a period is not available in the Finder. The computer starts up normally, but the disk (even if it is the startup disk) does not appear in Finder windows or on the desktop.

Solution

Mac OS X reserves names beginning with a period for system software items that are not intended to be visible in the Finder. Normally, an alert box with this message appears when you try to name a folder or file with a period as the first character:

> "You cannot use a name that begins with a dot ".", because these names are reserved for the system. Please choose another name."

If you name a disk with a period as the first character, its contents remain where you saved them, but you will not be able to see the disk in the Finder. You can remedy this by renaming the disk.

Start up in Mac OS 9

If your computer is able to start up with Mac OS 9, then follow these steps to rename the disk.

1. Choose Apple menu > System Preferences.
2. Choose View > Startup Disk.
3. Select a Mac OS 9 startup volume and click Restart. **Note:** If you no longer have Mac OS 9 installed on a hard disk, then use a Mac OS 9 startup CD-ROM disc if one came with the computer.
4. After Mac OS 9 has started, rename the volume so the period is no longer the first character. See technical document 50444 "**Mac OS 9: How to Change the Name of a Disk**" if you are unsure how to rename a disk.
5. Open the Startup Disk control panel.
6. Select the Mac OS X volume and click Restart.

If you are not able to start up in Mac OS 9

If the drive is removable (FireWire or USB or cartridge drive) and you have access to a different computer that uses Mac OS 9, connect the drive to the other computer and rename it. Otherwise, follow these steps:

If only Mac OS X is available, determine if the disk is the startup disk (the one containing the active system software used to start the computer) or another disk.

Disk is startup disk

1. Open /Applications/Utilities/Terminal
2. Type: `disktool -l`
3. Press Return.
4. You will see a list of available disks. You may see a line that looks like this for each volume:
***Disk Appeared ('disk0s10',Mountpoint = '/', fsType = 'hfs', volName= '.Macintosh HD')

5. Type the following: `disktool -n <volume> "<newname>"`
Note: Substitute the logical volume descriptor for <volume> and the name you want to use without a period as the <newname>. For example, to remove the period from the disk in the example above, the command would be: `disktool -n disk0s10 "Macintosh HD"`
6. Press Return
7. Choose Apple menu > Log Out.
8. Log in. The volume should now be visible

For more information about the disktool command, type "disktool" in Terminal and press Return.

Disk is not startup disk

First, you must know the pathname of the disk. You can learn how to read and write a pathname in technical document 106419: "**Mac OS: About Folders, Directories, and Pathnames**".

All disks and volumes other than the startup disk are located inside a directory called volumes at the root level of the hard disk. If the name of the disk were ".Macintosh HD", then the pathname to this disk would be:

/volumes/.Macintosh HD

Revealing the invisible folder in the Finder

You can reveal an invisible disk in the Finder by using the pathname along with the Go to Folder command.

1. Click the Finder icon in the Dock.
2. Choose Go > Go to Folder.
3. Type: `/volumes`
4. Click Go.
5. Choose View > As Columns. You should now see the formerly invisible folder in the Finder window.
6. Select the disk.
7. Choose File > Get Info (or Show Info).
8. Choose Names & Extension from the pop-up menu in the Info window.
9. In the "File system name" field, type a new name that does not begin with a period.
10. Press Return and close the Info window.
11. If the folder does not appear immediately, choose Apple menu > Log Out, and then log back in.

How many iChat buddies can I have on my Buddy List?

Learn the number of buddies allowed in an iChat Buddy List and what can happen if you go over the limit.

This article has been archived and is no longer updated by Apple.

If too many people are in your list and you try to add another, the Buddy's status is incorrect or not listed. If you quit and reopen iChat, the Buddy no longer appears in the Buddy List.

This can happen when you have more Buddies in your list than the AOL Instant Messenger network allows. The current limit for the number of Buddies in a Buddy List is 200. However, you may need over 190 Buddies before this issue occurs.

If you're at or close to the limit, delete people from your list before you add more.

DVD Studio Pro: Select the Recording Device When Doing Build & Format Disc

If you do not specifically select the device in the Format Disc dialog, the build process may continue without actually burning the disc.

This article has been archived and is no longer updated by Apple.

To burn a disc, follow these steps:

1. Choose File > Build & Format Disc.
2. Select a destination for the image (if you decide to Save As Image File)
3. Click the "Record to Device" radio button
4. Select a device in the list to see. You can then set options for simulation mode, and Lossless Linking (buffer underrun protection).
5. Click OK.

Selecting a device makes the simulation mode and Lossless Linking options available

iMovie: "Disk Responded Slowly" Alert

When recording a voiceover using iMovie an alert with the message "disk responded slowly" may appear.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to record a voiceover using the audio recording feature an alert with this message appears:

> "The disk responded slowly. It may have been interrupted by something, or it may not be fast enough for your movie. If you have a lot of audio clips, you might try muting the audio tracks to see if helps playback speed."

Solution

Quit other applications before recording audio in iMovie. Do not try to switch to another application while iMovie is recording audio.

Your computer may also have a fragmented hard disk. Frequent creation and deletion of files can cause disk fragmentation. This means that available disk space is not found in contiguous blocks. Although it's not a serious issue, it causes the disk to respond more slowly while you are importing media.

If you see this alert, copy the project to another disk, or consider using a disk defragmentation utility to defragment the disk where the project is located. See technical document 17933 "**Macintosh: About Defragmenting Your Computer's Hard Disk**" for additional information on disk fragmentation.

Keynote: Changes to Themes Don‘t Appear to Be Saved

Changes to Keynote themes are not saved unless the changes are made to the theme's master slide.
This article has been archived and is no longer updated by Apple.

Symptom

After opening a theme, making changes, and saving as a new theme, the changes do not appear to be saved. The new theme still contains the previous theme's settings.

Solution

Keynote themes are based on master slides, which contain the background and layout elements used in all new slides created with that theme.

If you open a new Keynote document using the gradient background theme, and change only the document's slide backgrounds and don't edit the master slides, the new theme you save will still have the gradient background.

To edit a master slide, you must be in the master slide organizer.

- Choose View > Show Master Slides to open the master slide organizer (or click View in the toolbar and choose Show Master Slides).

AppleWorks 6.2 for Windows: Unable to Select Starting Points Tabs

Installing QuickTime 6 may prevent you from changing tabs in the Starting Points window when using AppleWorks 6.2 for Windows.

This article has been archived and is no longer updated by Apple.

Symptom

Clicking the tabs at the bottom of the Starting Points window does not change tabs as expected.

Solution

This issue occurs after installing QuickTime 6 for Windows. There are three methods to work around this issue:

Method 1
If you are using Windows 98 or later, update to QuickTime 6.4 or later (http://www.apple.com/quicktime/download).

Method 2
If you are using Windows 95, uninstall QuickTime 6 and reinstall QuickTime 5.

Method 3
If you are using Windows 95 and do not want to reinstall QuickTime 5, right-click on the Starting Points window (not the tabs, but the window itself) to be able to select the different starting points panes using the "Switch To" shortcut menu.

QuickTime Broadcaster 1.0: Audio Dropouts While Receiving a Live Broadcast

When using QuickTime Broadcaster 1.0 to send a live stream, you may experience audio dropouts while receiving the broadcast with QuickTime Player.
This article has been archived and is no longer updated by Apple.

Symptom

QuickTime Player clients experience audio dropouts or breakups when receiving a live stream that is broadcast with QuickTime Broadcaster 1.0.

Solution

The default audio packet size setting in QuickTime Broadcaster 1.0 works for most networks. However, some networks are configured to drop packets over a given size. This can result in audio breakups or dropouts. Check with your network administrator for information about your network.

If you experience audio dropouts frequently, download and install QuickTime Broadcaster 1.0.1. If you already have QuickTime Broadcaster 1.0 installed on your computer, you can get version 1.0.1 using the Software Update pane in System Preferences. Alternatively, you can download it from the QuickTime website (http://www.apple.com/support/downloads/quicktimebroadcaster.html).

If you continue to experience audio dropouts while receiving a broadcast with QuickTime Player, lower the audio packet size in QuickTime Broadcaster. Follow these steps:

1. If you have not already done so, click Show Details in the QuickTime Broadcaster window.
2. Make sure you have selected the "Enable Audio Stream" option (see Figure 1).

Figure 1 Enable Audio Stream selected

3. Click Packetizer.
4. In the dialog that appears, you will see a "Packet size limit" field. You can lower the packet size by choosing one of the defaults or by entering a custom value. (See Figure 2.) **Note:** Lowering the packet size may reduce your output data rate.

Figure 2 Configuring packet size limit

iMovie: Improving audio and video synchronization

Learn steps to take if you export to QuickTime or iDVD from iMovie and the audio and video are out of sync. (The sound you hear does not match the video you see.)
This article has been archived and is no longer updated by Apple.
If your audio and video do not play in sync when exported to QuickTime or iDVD, check the following:

1. Make sure the DV camera you used to record or capture the footage was set to 16-bit at the time of recording (not 12-bit).
2. Make sure your QuickTime software is up to date.
3. If you are using iMovie 3, make sure you have updated to iMovie 3.0.3 or later.
4. You may be able to resolve audio synchronization issues by extracting the audio from the video clips in the iMovie project to a separate audio track:
    1. Select all video clips in the timeline (from the **Edit** menu, choose **Select All**).
    2. Extract audio to a separate track (from the **Advanced** menu, choose **Extract Audio**).

Export this project to QuickTime and see if your audio remains in sync when the resulting file is viewed in QuickTime Player.

iMovie: "Something is Wrong With the Plugin Localized.rsrc" Alert

This article has been archived and is no longer updated by Apple.

If incompatible plug-ins are installed, an alert with the message "Something is wrong with the plugin Localized.rsrc" appears when you open iMovie.

Symptom

When you open iMovie, an alert with this message appears:

> "Something is wrong with the plugin Localized.rsrc"

After dismissing the alert, iMovie appears to work normally.

Products affected

- iMovie

Solution

It is likely that there is an outdated version of the Toast Video CD Export plug-in installed.

1. Locate the iMovie application icon in the Finder. It should be in the Applications folder.
2. Click the application icon to select it.
3. Choose **File > Get Info**.
4. In the Get Info window that appears, select the Plug-ins pane as indicated:
    - For Mac OS 10.1 through 10.1.5, choose Plug-ins from the pop-up menu.
    - For Mac OS 10.2 or later, click the disclosure triangle next to Plug-ins.
5. Scroll through the list of plug-ins and deselect the Toast Video CD Export.

iMovie: Audio is distorted in projects with video imported from an analog to DV converter

Using video imported from some analog to DV converters may introduce audio distortion in iMovie 3.
This article has been archived and is no longer updated by Apple.

Symptom

- The audio is distorted in fresh video you import from an analog to DV converter
- The audio is distorted in an iMovie 2 project imported to iMovie 3. The project includes video that was captured by an analog to DV converter

Solution

1. Select the affected clip in the timeline.
2. From the **Advanced** menu, choose **Extract Audio** to extract the audio from the clip.

Depending on the device, a firmware or software update may be available which could correct the issue when importing new footage. Check with the converter manufacturer for additional information.

iMovie 3: How to Turn Off Zoom For Imported Photos

This article has been archived and is no longer updated by Apple.

This document explains how to turn off the zoom feature, also known as the Ken Burns effect, for photos imported into iMovie 3.

To import a photo without adding motion:

1. Update to iMovie 3.0.3 or later.
2. Navigate to the Photos pane in iMovie by clicking the Photos button.
3. Deselect the Ken Burns checkbox in the photos pane.
4. Select the photo in the Photos pane.
5. Click Apply, or drag the photo to the timeline.

To change a photo you've already imported to a motionless still image:

1. Update to iMovie 3.0.3 or later.
2. Navigate to the Photos pane in iMovie by clicking the Photos button.
3. Select the photo in the timeline.
4. Deselect the Ken Burns checkbox in the photos pane.
5. Click Apply.

See the AppleCare support downloads website (http://www.apple.com/support/downloads/) for iMovie updates.

For steps using iMovie 6, see this document.

QuickTime for Windows: About the QuickTime 6.1 Update

The QuickTime 6.1 Update addresses certain issues, and updates QuickTime for Windows software.

This article has been archived and is no longer updated by Apple.

This software updates QuickTime 6.0, 6.0.1, or 6.0.2 to QuickTime 6.1

System Requirements

To use QuickTime 6.1, your computer should meet these system requirements.

Windows

- Intel Pentium or compatible microprocessor
- Windows 98
- Windows Millennium Edition (Me)
- Windows NT
- Windows 2000
- Windows XP
- A minimum of 64 MB of memory (RAM)

Automated Software Update Installation

1. Open the QuickTime folder.
2. Open the QuickTime Updater application program. It automatically checks the server, then downloads, and installs the update.

Alternatively, open the QuickTime Player application, and choose "Check for QuickTime Updates" from the Help menu. Make sure you have an active Internet connection before you check for updates.

Standalone Installer

A standalone installer is available from the QuickTime website (http://www.apple.com/quicktime/).

About QuickTime 6.1

QuickTime is Apple's award-winning, industry-leading software architecture for creating, playing, and streaming digital media for Mac OS and Windows. With the introduction of QuickTime 6.1, Apple builds on its tradition of leading the industry in the adoption of revolutionary worldwide standards.

- MPEG-4 ISO compliant file creation
- MPEG-4 video codec
- AAC audio codec
- Instant-On streaming
- Macromedia Flash 5
- Enhanced QuickTime Player interface
- QuickTime Picks, bringing you the best, up-to-date content

Included in QuickTime 6.1

A true all-in-one, standards-based, cross-platform media tool, QuickTime 6.1 delivers a host of features that includes the following:

- Enhanced MPEG-4 video quality
- New encoding options in AAC audio
- Significant performance improvements in DV.
- Full screen enhancements for QuickTime Pro users.

For more information, see the QuickTime website at (http://www.apple.com/quicktime/). The QuickTime website also provides many links to cool QuickTime content and to other Internet sites that showcase QuickTime.

iPhoto: Duplicate Photos Not Detected During Import

Duplicate pictures appear as you import them, and iPhoto does not alert you to this fact.
This article has been archived and is no longer updated by Apple.

Symptom

There are duplicate pictures in the iPhoto Library.

Solution

Make sure the date and time settings on the camera used to shoot the pictures are correct. See your camera's documentation for information on how to set the date and time.

iPhoto saves pictures to the iPhoto Library in files and folders based on the date and time each file was created. iPhoto alerts you to possible duplicate files if it tries to copy a picture into a library folder that contains a photo with the same file name.

If the date and time settings on the camera used to shoot the pictures are incorrect, iPhoto may use the date when you import the pictures, which may result in duplicate pictures.

Published Date: Oct 11, 2016

USB: Descriptions of Ports, Connectors, and Cables

Descriptions and illustrations of USB ports, connectors, and cables.
This article has been archived and is no longer updated by Apple.

USB Ports and Connectors
There are two types of USB ports and connectors, Type A and Type B.

Type A
Type A ports and connectors are small and rectangular and are typically used to plug a device into a Type A USB port on a computer or a hub. Type A ports and connectors are sometimes referred to as "upstream".

Figure 1 USB Type A port and connector

Type B
Type B ports and connectors are small and square and are used to attach a USB cable to a USB device. Type B ports and connectors are sometimes referred to as "downstream".

Figure 2 USB Type B port and connector

Note: Many devices have a "captive," or attached, cable that includes a built-in USB connector.

USB ports on the computer
Your computer has two USB Type A ports; the top port is numbered 1 and the bottom port is numbered 2.

Note: You should plug the Apple USB Mouse into a port on the Apple USB Keyboard, then plug the keyboard into a USB port on your computer. This leaves one open USB port on your computer to which you can connect another device, such as a printer.

USB ports on the Apple USB Keyboard
The keyboard has two USB ports, one on either side. You can plug the Apple USB Mouse into one port, leaving the other port open to connect another USB device, such as an external storage device.

USB Cables
Many USB devices have a captive, or attached, USB cable, such as the Apple USB Keyboard. Other devices come with a standard USB cable that has a Type A connector on one end and a Type B connector on the other end.

Some devices may come with an adapter or adapter cable. Third-party manufacturers may also sell adapters. See an Apple Reseller for more information.

If you're using an adapter or adapter cable to connect a USB device, follow these steps:

1. Plug the adapter or adapter cable into the existing cable from the device.

2. Do one of the following:

    - If you're using an adapter cable, plug that cable directly into a USB port on the computer, the Apple USB Keyboard, or another USB device.
    - If you're using an adapter, plug a standard USB cable into one end of the adapter, then plug the other end of the USB cable into a USB port on the computer, the Apple USB Keyboard, or another USB device.

Published Date: Feb 20, 2012

USB: Hub Description

This article describes what a USB Hub is, and the two kinds of USB based hubs: self-powered and bus-powered.
This article has been archived and is no longer updated by Apple.

What is a USB Hub?

Since USB (Universal Serial Bus) can work with simultaneous connection of up to 127 devices, hubs are used to attach additional USB peripherals. When a computer's USB ports fill up, simply attach a device called a hub, which provides additional ports (usually four or seven), and keep on plugging in more peripherals-and hubs-as needed.

Self-powered hubs

This type of hub has an AC adapter that provides external power to the hub. To use the hub, you need to plug the adapter cord into an electrical outlet or power strip. Since this hub supplies its own power, you can often connect several devices to it. Typical self-powered hubs have four USB ports.

Bus-powered hubs

This type of hub gets power from another source, such as a computer. You can plug other devices into a bus-powered hub. The Apple USB keyboard acts as a bus-powered hub. However, if a device requires high power, such as a printer, a bus-powered hub will not be able to supply enough power.

Note: You should use self-powered hubs versus bus-powered hubs for best capability and performance.

Important: Under the USB Specification you cannot connect two bus-powered hubs together because there won't be enough power for the second hub. To connect two hubs together, at least one hub must be self-powered. For this reason, you cannot connect an Apple USB keyboard to the USB port on another Apple USB keyboard. If you want to use two bus-powered hubs with your computer, connect each to a USB port on the computer.

For a partial list of USB Hubs, please visit the USB Peripherals web page at http://www.apple.com/usb/

106657: "**Mac OS 8, Mac OS 9: File Sharing**"
Published Date: Feb 20, 2012

iMac: Attaching an External Display

This article discusses support for an external display on iMac.
This article has been archived and is no longer updated by Apple.
The original iMac was not designed to support an external display. The iMac (Slot Loading) DV models, and those introduced after it, do support video mirroring through the built-in VGA port. Refer to your owners documentation to determine if your iMac model supports an external display.

Refer to article 58467: "**iMac (Slot Loading): Connecting External Display to VGA Port**" for additional information.

Apple designed the iMac with a very sharp, 15-inch internal display but did not include a video-out port for connecting a second display. iMac is designed for the consumer market, and one of the themes incorporated in iMac was simplicity.

Note: The information in this article also appears in the following Knowledge Base articles:

- article 30648: **iMac: Frequently Asked Questions (1 of 2)**
- article 30649: **iMac: Frequently Asked Questions (2 of 2)**

USB: Troubleshooting Error Messages

This document lists USB device error messages you might see.
This article has been archived and is no longer updated by Apple.
If you encounter any difficulties with USB devices, they are generally easily resolved. Basically, there are four kinds of error messages or alerts the Mac OS may use for a USB issue. These include:

- Not Enough Power to Function
- Not Enough Power for All Functions
- The USB driver needs to be updated. Would you like to search for the update on the internet?
- No Driver Found

No error message at all - device simply stops functioning

The Mac OS will not generate an error message at all in some cases, for the same reasons as the "Not Enough Power to Function" message. In these cases it is often necessary to do both of the following actions:

- Plug devices that draw a high amount of power directly into the computer's USB port, or connect it to its power supply if it has one.
- Unplug and replug the chain of USB devices if a high-draw device was connected to it. Connecting a high-draw device can potentially make the computer "deaf" to the entire chain of devices.

Not Enough Power to Function

The Mac OS will generate a "Not Enough Power to Function" message if:

- A device tries to draw too much power from the USB bus.
- One or more devices plugged into a hub requires more power than is available.
- You have attached a self-powered device (like a printer or floppy drive) and forgot to plug it into an electrical outlet.

Solution
If you're using a self-powered device, make sure it is plugged into a working electrical outlet. If not, try connecting the device directly to your computer or to a port on a powered hub. If you're connecting the USB device to a powered hub, make sure the hub is plugged into a working electrical outlet.

Not Enough Power For All Functions

The Mac OS will generate a "Not Enough Power for All Functions" message if there is enough power to supply some but not all of the functions the device is designed to provide.

Solution
As above, you'll need to see if the USB device has its own power cord and, if it does, you'll need to plug it into a working electrical outlet. Also, try plugging the cable for the USB device directly into to your computer or to an available port on a powered hub. If you're connecting the USB device to a powered hub, make sure the hub is plugged into a working electrical outlet.

The USB driver needs to be updated. Would you like to search for the update on the internet?

The Mac OS will generate this error message if it detects an out-of-date driver.

Solution
You can elect to download the driver from the Internet if you have a connection.

No Driver Found

The Mac OS will generate a "No Driver Found" message if a driver for the USB device is not found.

If you see this message, you might have forgotten to install the device driver, or you may have incorrectly installed the device driver.

Solution

Reinstall the software driver that came with the product, check the Extensions Manager control panel to see if it is disabled, or download and install the driver from the product vendor's website.

USB Capable Macintosh: Connecting Serial, LocalTalk, or Parallel Devices

This article explains how to connect serial, parallel, or LocalTalk peripheral devices to iMac, Power Macintosh, PowerBook, and iBook computers with a Universal Serial Bus (USB) or Ethernet port.
This article has been archived and is no longer updated by Apple.
With the proper adapter, a serial, parallel, or LocalTalk printer can be connected to your computer's USB or Ethernet port. Sometimes, a new printer driver is required. Check with the adapter's vendor for compatibility information.

To determine how your printer was designed to communicate with your computer, refer to its owners guide. Once you know whether the printer is serial, parallel, or LocalTalk, refer to the proper section below for adapter information.

Popular Ink Jet Printer Adapters

For connecting some of the more popular ink jet printers via USB.

- The Epson Stylus Color 740 has built-in USB support. Epson offers a USB/Parallel Printer Adapter Kit for use with many of their other printers. Further information is available at: http://www.epson.com/northamerica.html
- The Hewlett Packard (HP) Printer Cable Kit, which allows HP's Deskjet 670C, 672C, 690C, 692C and 694C printers and others to connect to the USB port. Further information is available at: http://www.hp.com

USB to Parallel Adapters

For connecting printers with a parallel port to the USB port.

- USB Parallel Adaptor by Belkin: http://www.belkin.com
- Strydent Software offers PowerPrint USB, which enables you to print from many common ink jet printers. http://www.strydent.com/

USB to Serial Adapters

For connecting printers with a serial port to the USB port.

Alternatives to a Floppy Drive

Since recent Apple computers do not come with a floppy disk drive built-in, what options are available?
This article has been archived and is no longer updated by Apple.
There are a number of third-party companies providing low cost floppy drives, removable media drives, and external hard disk drives for use with recent Macintosh computers such as the Power Mac G4, iMac, or iBook.

All of these products will connect to your computer via Universal Serial Bus (USB) or FireWire. USB is a peripheral bus standard that allows you to connect a variety of peripheral devices to your computer. FireWire is a peripheral bus as well but much faster. Until the introduction of the iMac, Macintosh computers used Small Computer Standard Interface (SCSI), Apple Desktop Bus (ADB), and serial connections to connect peripheral devices. USB and FireWire has virtually replaced these standards.

Here are a few of the products already announced:

The Imation SuperDisk USB Drive, which reads both 1.44 MB and 120 MB disks. Further information is available at:
http://www.imation.com/

The Iomega 100 MB Zip Drive. Further information is available at: **http://www.iomega.com/**

LaCie external 2, 4 and 8 Gigabyte hard disk drives and an external DVD-ROM drive. Further information is available at: **http://www.lacie.com/**

VST Technologies FireWire Full Height Zip250 Drive, FireWire Zip100. Further information is available at:
http://www.vsttech.com

For further information, please refer to the following Knowledge Base articles which address many frequently asked questions pertaining to USB or FireWire, or visit Apple's USB or FireWire pages at: **http://www.apple.com/usb/**, **http://www.apple.com/firewire**.

Related articles on connecting older peripherals to iMacs:

- article 43027: **iMac: Can I Connect My Serial Printer?**
- article 43025: **iMac: Can I Use My Old Joystick?**
- article 43026: **iMac: Can I Use My External SCSI Hard Disk?**

Additional information on USB:
USB is a multi-platform standard. You can use any USB device that is developed for use with the Mac OS. Check for the Mac OS logo on the USB product packaging, which tells you that the USB product will work with Macintosh computers.

Manufacturers of USB devices for personal computers that do not use the Mac OS may offer software you can install on your computer so that you can use their USB device with your Mac OS computer. For more information, contact the device's manufacturer. For the latest information on USB in Apple products, visit: **http://www.apple.com/usb/**

iMac: Can I Use My Older Software?

I would like to use some of my older applications with my iMac. Is this possible?
This article has been archived and is no longer updated by Apple.
If you have a Power Macintosh (or Performa model with 4 numeral name, such as 6110) most of your software should be compatible. However, please use the following guidelines:

- • Refer to the list of bundled software which comes with your iMac (shown below) and see if any of your older applications are in the list. If so, use the version which comes with your iMac.
- If the older software were provided to you on a CD-ROM, use that original CD-ROM to install the software, rather than connecting the older Macintosh with your iMac and transferring the files over.
- Contact the software manufacturer regarding more recent application updates and compatibility information.
- The files you'll probably want the most are data files, such as databases, spreadsheets, letters written in a word processor and other such items. Consider transferring those files and using some of the bundled application software.

If you need assistance in determining how to connect your older Macintosh with your iMac, visit the **iMac Connectivity Page** for advice

Bundled Software
Below we've included a partial list of bundled software that shipped on the original iMac computer. In the U.S., the iMac shipped with Mac OS 8.1. It will also include QuickTime 3.0 Standard Edition and the following Apple and third-party applications:

Productivity Software:

- ClarisWorks 5.0v1
- Quicken Deluxe 98 for Macintosh (CD)

Connectivity/Communications Software:

- Total Access 2.01 (EarthLink)
- FAXstf 5.0
- Internet Explorer 4.01 (Part of Mac OS 8.1)
- Netscape Navigator 4.0.5 (Part of Mac OS 8.1)
- Outlook Express 4.01 (Part of Mac OS 8.1)
- America Online 4.0

Personal Development Software ('fun stuff"):

- MDK (CD, not preinstalled)
- Nanosaur
- Kai's Photo Soap SE 1.0 (CD, not preinstalled)
- Williams-Sonoma Guide to Good Cooking (CD)

Hard Drive: Options for Backing Up Contents

Suggestions on how to back up your hard disk.
This article has been archived and is no longer updated by Apple.
There are three options for performing a back up of your hard disk: a locally connected USB or FireWire storage device, a network backup server or storage device, or an Internet based back up service.

Locally Connected Storage Device
Recent desktop and portable computers from Apple feature Universal Serial Bus (USB) and FireWire ports that make it easy to attach high capacity mass-storage devices that are ideal for backing up the larger hard disk installed.

As an alternative to backing up to floppy disks, the following USB options are available:

- the USB SyQuest SparQ disk holds up to 1 GB
- the USB Imation SuperDisk holds up to 120 MB
- the USB Iomega Zip disks holds up to 250 MB
- the FireWire VST Technologies hard drive has capacities starting at 10 GB

To see some of the USB storage devices, and other USB devices, refer to: **http://www.apple.com/usb**

Network Backup Server
If you're connected to a network, you can use products such as Retrospect from Dantz Development to back up your files to a large volume on the network, a DAT drive, or some other media. To read about Retrospect : **http://www.dantz.com**

Internet Back Up Service
There are several back up resources on the Internet, including Apple's iDisk, that you can use to back up files on your hard drive.

Note: Some Internet backup solutions have less disk space than the removable media mentioned earlier in the article. .Mac members get 10 GB total storage for iDisk and .Mac Mail with the option to purchase up to 30 GB, so check with the back up solution vendor for space limitations and select the one that matches your data back up needs.

PC Compatibility Overview

This article gives an overview of PC compatibility for Macintosh users. It was written in September, 1998.
This article has been archived and is no longer updated by Apple.
Occasionally, Macintosh users might need to work with Windows documents, run Windows applications and print or share files over a network. If you find yourself in that situation, you'll be pleased to know that there are time-tested solutions that enable Macs to easily integrate with PCs. You'll find an overview of the wide range of PC compatibility solutions below.

ACCESSING WINDOWS DATA

There are hundreds of leading applications that have native versions for both Macintosh and Windows. Microsoft Office is an excellent example of an application with full file format compatibility between the two versions. For a comprehensive list of cross platform and Mac only applications, visit **http://www.macsoftware.apple.com**.

Apple's SuperDrive provides Macintosh systems (that have floppy drives) the ability to access and understand PC content. The SuperDrive can format, read, and write to 3.5-inch disks in the following formats:

- Macintosh: single-sided (400K), double-sided (800K), high-density (1.4MB)
- Apple II ProDOS: 800K
- MS-DOS: 720K, 1.44MB.

Easy Open and PC Exchange are Mac OS features that work in tandem to enable a Mac to open and edit ProDOS, MS-DOS, Windows and OS/2 files with compatible Macintosh applications. PC Exchange lets you insert a DOS-formatted floppy disk into a SuperDrive and view the disk's contents from the Macintosh desktop just as if the floppy came from another Macintosh. When you double-click on a DOS or Windows file to open it, Easy Open automatically searches for applications and file translators that are capable of opening it and lists the applications for you. Once an application is selected, Easy Open manages the translation and opening of the file.

When no application is available for directly opening a PC file, an extensive suite of translators from Data Viz, called MacLink Plus, can be used to convert the file to a format compatible with a corresponding Macintosh application.

RUNNING WINDOWS APPLICATIONS

There are three ways to run Windows applications on a Macintosh - via software emulation, PC compatibility cards and thin-client/server computing.

Today, the most common method of running a DOS or Windows application on a Macintosh is software emulation. The speed of the Power Macintosh systems makes emulation viable and affordable. There are several software emulation products to choose from. For example, Insignia's RealPC, SoftWindows 95 and SoftWindows 98 products allow you to run DOS, Windows 95 and Windows 98 applications. Connectix's Virtual PC allows you to run DOS, Windows 95/98, or Windows NT applications.

When you need a higher level of performance from a Windows application, consider adding a PC compatibility card. Orange Micro's OrangePC Windows Compatibility Card is a PC computer on a card that allows users to run Windows 95/98 and Windows NT.

The latest strategy is thin-client/server computing where an NT Server runs Windows applications over a network. The clients (personal computers) don't need to have these applications on their hard drive nor do they need to have much more than a fast LAN network connection. Client/server solutions work equally on Windows systems, Macintosh systems, UNIX workstations, and in some cases, PDAs. Citrix System's WinFrame and Microsoft's Windows Terminal Server are key solutions in this area.

USING NETWORK RESOURCES

Many companies with a mixed environment of Macs and PCs use Novell's NetWare or Microsoft's NT Server for access to files and printers over a network. Macintosh users enjoy robust access to both server environments.

Macintosh clients for Novell networks are currently available for both intraNetware and NetWare version 4.11. In 1999, a new Macintosh client will be available for NetWare 5.

There are three ways to connect a Macintosh to a Windows network. The most common way is for the network administrator to turn on AppleTalk Services ... then, it just works! There are also solutions that let the Macintosh share files and printers on a PC network without any involvement from the network administrator. You can extend the Windows server to support the Macintosh protocol or extend the Mac OS to support the Windows protocols. On the personal computer side, Thursby Software's DAVE product adds full SMB support to the Mac OS. For NT Servers, you can investigate Microsoft's Services For Macintosh and Miramar Software's MacLan Connect.

A Macintosh server installed with AppleShare IP 6.0, Apple's award-winning Mac OS server software, provides cross-platform support for use in mixed computing environments. New file sharing support for Windows clients allows Windows 95/98 and Windows NT clients to natively access AppleShare IP 6.0 servers. AppleShare IP 6.0 can also register with a WINS server for inclusion on a Windows NT Intranet.

Useful Mac OS X Terms: What is a Bundle?

Bundles are a new way of packaging applications in Mac OS X.

This article has been archived and is no longer updated by Apple.

In Mac OS 9, an application often resided in several folders, such as shared libraries in the Extensions folder, and the executable application in some arbitrary folder. In addition, an application itself was comprised of two "forks" within a single file: a data fork (which in the case of PowerPC code contained the program's executable code), and a resource fork. The resource fork contained templates for various elements of the user interface, such as the names of menus, menu items, dialogs, window types, the icon the Finder should display, and so forth.

In Mac OS X, this has changed. A bundle is a collection of these various data elements (executable code, resource information), each of which is a single file. These files are gathered together in a folder or "directory" and then presented to the user as a single, double-clickable file. In Mac OS X, applications are bundles.

Tip: Icons have an .icns suffix. You can edit them with Icon Composer or Pixie, two utilities that are available from the Apple Developer Connection (http://www.apple.com/developer/).

Tip: A bundle may be opened so you can see the individual components of the directory. Press Control then click its icon and choose Show Package Contents from the contextual menu.

Tip: Bundles are sometimes called "packages."

For further information, please visit Apple's Developer Connection at: http://www.apple.com/developer/ or you can view the specific Bundle information at:

http://developer.apple.com/techpubs/macosx/Essentials/SystemOverview/Bundles/

Useful Mac OS X Terms: What are Frameworks?

This document explains what frameworks are.
This article has been archived and is no longer updated by Apple.

Frameworks

A framework is a dynamic (loaded only when used) shared library along with its associated resource information. This information is packaged as a bundle. This is analogous to the shared libraries, which are placed in the Extensions folder in Mac OS 9.

Shared libraries contain code that can be shared by multiple applications. For instance, if a manufacturer produces a suite of productivity software, odds are there is going to be a great deal of similarity within their code. Therefore, from a development and deployment perspective, it makes sense to allow the applications to share common code.

Umbrella Frameworks

Umbrella frameworks are generally system software-level functions. This concept refers to a framework which itself contains two or more subframeworks. Generally this shouldn't come up in support.

Additional information

Frameworks are covered in depth at the Apple Developer Connection at:

http://developer.apple.com/techpubs/macosx/Essentials/SystemOverview/Frameworks/Frameworks.html

Useful Mac OS X Terms: What is Mach?

This document explains what Mach is.
This article has been archived and is no longer updated by Apple.
Mach is part of the underlying technology of Mac OS X. It is a UNIX technology developed at Carnegie-Mellon University in the late 1980s and 1990s. It is a robust, "open source" operating system, which is used to provide memory and task implementation services. Darwin uses Mach 3.0. Mach provides memory management, memory protection, process scheduling and interprocess communication services.

Mach, together with BSD, forms the heart of Mac OS X, known as Darwin.

Mac OS X: What is BSD?

Learn what BSD is.
This article has been archived and is no longer updated by Apple.

BSD is the Berkeley Standard Distribution. In the early 1980s, the University of California at Berkeley was a major center of focus of UNIX activity. They adapted AT&T's System III and provided more sophisticated process management and network functionality. They distributed their version of UNIX, called the Berkeley Standard Distribution, for what amounted to the cost of goods. This, in turn, was widely adapted by academia and turned into the source material for further innovations by companies such as Sun Microsystems. Darwin incorporates elements of the BSD 4.4 distribution, which provide file system support, network services, symmetric multiprocessing support, and multi-threading facilities.

BSD also provides support for the "shell" environment. Simply put, a shell is an interactive, command-line interface that allows the user to control the operating system and accomplish tasks. UNIX is often confused with its shell interface. However, the best way to view the shell is as one of many possible ways to manipulate the core services.

For three decades, the easiest way to do this was via command-line interfaces, such as the Bourne shell (sh), the C-shell (csh), the Korn shell (ksh), tcsh, bash, and many others. However, starting in the 1980s, manufacturers started to experiment with many different ways to provide similar control via graphical interfaces, such as SunView, Motif, XWindows, and others. None of these graphical approaches has reached the level of integration that Mac OS X provides.

The shell environment is completely optional for most users. It provides maximum control over the operating system. It will appeal mainly to advanced system administrators, computer science students and experienced UNIX users. The only way to get to the shell in Mac OS X is for the user to locate the Terminal application and open it.

Useful Mac OS X Terms: What is Darwin?

This document explains what Darwin is.
This article has been archived and is no longer updated by Apple.
Beneath the appealing, easy-to-use interface of Mac OS X is a rock-solid foundation that is engineered for stability, reliability, and performance. This foundation is a core operating system commonly known as Darwin. Darwin integrates a number of technologies, most importantly Mach 3.0, operating-system services based on 4.4 BSD (Berkeley Software Distribution), high-performance networking facilities, and support for multiple integrated file systems.

Darwin 1.4.1 is the UNIX-based, open-source foundation of Mac OS X. It is based on FreeBSD and Mach 3.0 technologies and provides protected memory and pre-emptive multitasking. This release corresponds to the release of Mac OS X 10.1.

- For a brief overview of Mach, see technical document 43137: Useful Mac OS X Terms: What is Mach?
- For a brief overview of BSD, see technical document 43139: Useful Mac OS X Terms: What is BSD?
- For a brief overview of Darwin, see technical document 43140: Useful Mac OS X Terms: What is Darwin?

Useful Mac OS X Terms: What is Quartz?

Quartz is the one of the graphics services in Mac OS X, the others are OpenGL and QuickTime.
This article has been archived and is no longer updated by Apple.
Quartz is the two dimensional graphics service in Mac OS X. It is the modern heart of the Mac OS X user experience, superseding QuickDraw and related managers. Quartz directly supports the Aqua user experience by displaying crisp two-dimensional graphics to create the user interface, including on-the-fly rendering and anti-aliasing. Quartz is based on the Adobe Portable Document Format (PDF). PDF is the standard for electronic document distribution worldwide. PDF is a universal file format that preserves all of the fonts, formatting, colors and graphics of any source document--regardless of the application and platform used to create it.

- For a brief explanation of OpenGL, see technical document 43142: **Useful Mac OS X Terms: What is OpenGL?**
- For in depth information on Quartz, please visit the Apple Developer Connection web site at: http://developer.apple.com/quartz/index.html
- For in-depth information on OpenGL, please visit the Apple Developer Connection web site at: http://developer.apple.com/opengl/index.html

Published Date: Feb 20, 2012

Mac OS X: What is OpenGL?

This article has been archived and is no longer updated by Apple.

OpenGL is the one of the graphics services in Mac OS X, others include Quartz and QuickTime.

OpenGL is a sophisticated open-standard, three-dimensional rendering system. Developed as an open source project (OPEN Graphics Library) by Silicon Graphics in the 1990s, OpenGL supports advanced 3D rendering. It is of primary interest to game and multimedia developers. It also has a role in scientific visualization. OpenGL replaces QuickDraw 3D.

For a brief explanation of Quartz, see technical document 43141: "**Useful Mac OS X Terms: What is Quartz?**"

For in depth information on Quartz, please visit the Apple Developer Connection Web site (http://developer.apple.com/quartz/index.html).

For in-depth information on OpenGL, please visit the Apple Developer Connection Web site (http://developer.apple.com/opengl/index.html).

Mac OS 9 and earlier: System Stops Responding and Basic Troubleshooting

This article provides troubleshooting assistance and issue resolution for Macintosh computers with Mac OS 9.x or earlier.

This article has been archived and is no longer updated by Apple.

How to Start Troubleshooting

The most useful thing you can do is to set up a fault log in which you record exactly what was going on when the condition occurred. The format below should help:

- Which version of system software is being used
- Program name (include version number)
- Other Applications open at the time
- List all Extensions and Control Panels
- What were you doing when the issue occurred (be **exact**)
- What was the result (error message, computer stopped responding)
- What you tried to do to get out of it and with what results
- Did you have to restart the computer?
- Did things work okay after restarting the computer

If the computer repeatedly stops responding, begin the troubleshooting cycle below. Make notes of what you do and the results .

If it becomes necessary for you to take your computer to your apple service provider to assist you with the troubleshooting, this information will be helpful for explaining the computer's condition.

What Causes a Program to no Longer Open or unexpectedly Quit?

There are many causes for issues of this nature, leading among them:

System Software

A previous system error could make your application or system software unusable to some degree. The solution is to reinstall system software and the application. It is usually wise to keep a copy of system software nearby so that you can reinstall after any serious issue. An incompatible extension or Control Panel after being used, even if removed, may leave "bits and pieces" of itself behind. Performing a clean installation of the system software should correct this problem.

System and Application Version Incompatibility

Not all versions of system software and application software are compatible. Most applications clearly indicate what version of system software is required to permit the program to operate correctly. If you are using an older version of system software, you may have issues. If you are using the current system software, but using an old version of application software you may run into issues. Occasionally, when system software is updated, some earlier functioning applications may fail to perform reliably. This is a compatibility issue, you have only two alternatives: revert to an older version of system software under which the application operated properly, or contact the software vendor and inquire about the availability of a "patch" or upgrade.

Out of Memory condition

Some programs require a lot of memory. You may discover you do not have enough memory to open the application and have all the features work correctly. Some programs will fail to open at all, while others open and operate for a while until you try to perform some function requiring additional memory. You can close the other applications you have opened or obtain more memory.

In some cases, the "out of memory" condition may not accurately reflect the issue. This situation may exist when a program requires that you have a certain amount of "contiguous" memory available. While the computer may display it has 1MB of RAM available, and the program only needs 267 K, you may not have 267 K of memory all in one "chunk". Close the other applications you have opened, then open the application which would not previously open.

Sometimes completely restarting the computer is necessary. In some situations, your application may not have enough memory allocated to it to permit it to run correctly: this includes the Finder. Select the application, then choose Get Info from the File menu (or Command-I). If you do not have as much memory allocated as recommended, increase to the recommended amount. If you have the correct allocation, try increasing the amount of memory allocated to it (double the amount).

Extension or Control Panel Compatibility Issue

Some add on software, such as extensions, control panels, and apple menu items might not have been written to permit them to be compatible with

some versions of system software. This is a situation that you can usually identify quickly. Usually, symptoms develop shortly after installing some new add on software, or after you install a new version of system software. Your only recourse is to remove the offending add on software and pursue a long-term solution with the software vendor or author.

Desktop Manager "Confusion"

The most telling sign to this issue is when you try to open an application by double-clicking on one of its documents, or in trying to print one of its documents from the desktop and you receive the message "application is busy or missing." If this is the case, either your application is busy (for instance, you are trying to run a single user program on a network when someone else is already running it); it is missing (it is unusable or it has been deleted inadvertently); or the desktop manager cannot locate the application.

Step 1
Check and confirm that the application is on the hard drive.

Step 2
Launch the application and verify that it is functioning correctly.

Step 3
Rebuild your desktop file by restarting your computer while holding down the Option and Command keys.
Note: A dialog box will inform you that rebuilding your desktop will take a few minutes. You are no longer required to hold down the two keys.

Step 4
Click OK.

Your desktop will be rebuilt, and you should be able to continue without any issues. For best performance, rebuild the desktop periodically.

iMac: iMac Update 1.0 Software

iMac Update Version 1.0 was released September 2, 1998 and is only for installation on the original Bondi blue iMac, and only if it is running Mac OS 8.1.

Hardware Required: Original iMac (Revision A)
This article has been archived and is no longer updated by Apple.
Note: The iMac Update 1.0 is no longer available from Apple Software Updates sites.

Important: iMac customers who are using Mac OS 8.5 or later should not install this update and should review article 58174: "**iMac: When to Install Available Updaters**" to determine if they should install iMac Update 1.1.

AppleShare IP 5.0: FTP Service (FAQ)

This article contains frequently asked questions (FAQ) regarding AppleShare IP 5.0 FTP Service, with answers to those questions. Additional AppleShare IP FAQ's are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. How are 'put' files stored on the server?
2. Are files uploaded to the FTP server automatically binhexed?
3. Are they also compressed?
4. Are files downloaded from the FTP Server automatically decoded?
5. How do I FTP from Netscape Navigator or Internet Explorer if a name and password are required?
6. When I log on to an AppleShare IP 5.0 Server using AppleTalk and the Chooser, I can 'upload' files in a drop folder. However, when I log on using FTP, the FTP application says "Access Denied" when 'putting' files in the same drop folder.
7. Why can't I put files in a folder with "Drop Box" permissions?
8. Why don't aliases resolve that reside on the FTP server?
9. Why can't I use "mget" to get a list of files?

Question 1: How are 'put' files stored on the server?

Answer: Files are stored in their original format.

Question 2: Are files uploaded to the FTP server automatically binhexed?

Answer: The encoding of a file in any format is specific to the client used. The most common formats are MacBinary and Binhex. Many Macintosh FTP clients will automatically encode the file before posting it to the server in the format selected by their preference setting.

When a file is received by the AppleShare IP server, it automatically decodes any file in the MacBinary or Binhex format.

Question 3: Are they also compressed?

Answer: The compression of a file is again entirely dependent on the FTP client being used. Some Macintosh FTP clients have the ability to compress a file before sending it to the server if that function is enabled by their preference setting.

The AppleShare IP FTP is not capable of decompressing files.

Question 4: Are files downloaded from the FTP Server automatically decoded?

Answer: Not all transmitted files are encoded, so sometimes decoding is not necessary. If decoding is necessary, most of the FTP clients for Mac OS are capable of decoding automatically. The behavior in this matter is entirely dependent on the FTP client.

Here is what the FTP server uses to determine what type of encoding is necessary:

- If the transfer mode is "text" (ASCII), and the target file is a text file, then it is encoded in the text format.
- If the transfer mode is "text" (ASCII), and the target file is NOT a text file, then it is encoded in the Binhex format.
- If the transfer mode is "binary" (Image), then just the data fork of the file is transferred with NO encoding.
- If the transfer mode is "binary" (Image) and a "MACB E" command has been issued, then the file is encoded in MacBinary format.

Fetch (3.0.2 and greater) has been modified to be AppleShare IP friendly. It will automatically take care of all encoding/decoding needs if left in the "Automatic" mode.

Question 5: How do I FTP from Netscape Navigator or Internet Explorer if a name and password are required?

Answer: Use this URL format: ftp://username:password@ftp.site.com/

Question 6: When I log on to an AppleShare IP 5.0 Server using AppleTalk and the Chooser, I can 'upload' files in a drop folder. However, when I log on using FTP, the FTP application says "Access Denied" when 'putting' files in the same drop folder.

Answer: In order to use a common AppleShare IP 5.0 dropbox, the FTP client needs to have the "store unique" option available. Currently, Fetch does not support this feature. Most Unix clients will support this "store unique" option.

Question 7: Why can't I put files in a folder with "Drop Box" permissions?

Answer: In order to maintain security and a consistent user experience across all services, the FTP client must use the "Store Unique" option in order to put files in a "Drop Box" folder. While most Mac OS clients currently do not support this feature, many Unix FTP clients do.

Question 8: Why don't aliases resolve that reside on the FTP server?

Answer: Aliases do not resolve to ensure server security.

Question 9: Why can't I use "mget" to get a list of files?

Answer: You can use the "mget" command on some FTP clients to retrieve a list of files rather than one at a time. However, the list must consist of full filenames. Using wildcards in filenames (examples: *.gif, *.jpg) is not supported in this release of the FTP server.

AppleShare IP 5.0: Administration (FAQ)

This article contains frequently asked questions (FAQ) regarding AppleShare IP 5.0 Administration, with answers to those questions. Additional AppleShare IP FAQ's are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What can I do if I forget my AppleShare IP Admin password?
2. Are volume access privileges still stored in the AppleShare PDS file?
3. Is the Users & Groups Data File shared by all of the AppleShare IP services?
4. What information is stored in the AppleShare IP 5.0 preference files?
5. Is the "copy volume" command still available?
6. Can I still compact access privileges?
7. What AppleShare IP services can I move to different servers?
8. What is the Users & Groups Data File backup?
9. Where is serial number stored?
10. Can I move my Users & Groups data file to a new System folder after I do a Clean Install or move the server to a different computer?
11. How can I delete an entire group of users, that is the Class of '98 group and all of its users?
12. In the ANAT (Apple Network Administrator Toolkit) Users and Groups Manager you can import groups, but you cannot turn on mail. In AppleShare IP users and groups you can turn on mail, but you cannot import groups. Any suggestions for doing both? Will the Santorini Server Manager do this?

Question 1: What can I do if I forget my AppleShare IP Admin password?

Answer: Follow these steps:

1. Restart the server with the Appleshare IP extensions turned off in the Extension Manager control panel.
2. Change the Owner information in the Sharing Setup control panel.
3. Go back to Extensions Manager control panel and turn on the Appleshare IP extensions.
4. Restart the server with the Extensions Manager's Restart button.

Question 2: Are volume access privileges still stored in the AppleShare PDS file?

Answer: Yes. Each volume still contains an invisible AppleShare PDS file on the root level of its directory. You will need to make it visible with a utility like Norton Disk Editor, or ResEdit in order to throw it away. This is normally done when the privileges are corrupt and changes cannot be made t the privileges.

Question 3: Is the Users & Groups Data File shared by all of the AppleShare IP services?

Answer: The Datafile is shared by the AppleShare, Web, Mail, and FTP servers. It is best to keep those services on one server. The Print server does not use the Users & Group data file and can be placed on another server to balance traffic loads.

Question 4: What information is stored in the AppleShare IP 5.0 preference files?
Answer: AppleShare IP 5.0 AppleShare/Web/FTP Server Attributes

General Information
version number for this record
version# for file server
user activity limit in %
maximum client connections
maximum number of guest and anonymous logins
minutes until shutdown

Connect Info & Login Greeting
version number for this record
login greeting

Mail Store Volume Name
Bounce Server Name
Bounce Zone Name
Bounce DNS Name

Attribute in each user record
AppleTalk Forward Name
AppleTalk Forward Server
AppleTalk Forward Zone
Smtp ForwardFingerprint Length
MU Attributes - only mail server fills in this field

Question 5: Is the "copy volume" command still available?

Answer: Yes. It is now the "Duplicate Folder" command.

Question 6: Can I still compact access privileges?

Answer: No. It is not necessary. It is done automatically by the server software.

Question 7: What AppleShare IP services can I move to different servers?

Answer: All AppleShare IP services have to be installed on Apple Power Macintosh computers.

In addition, Web/File/FTP services use the same the Users & Groups datafile. To make updating Users & Groups easier, you should keep them on the same computer. But, if you have Apple Network Administrator's User & Group Manager - it can be used to keep multiple AppleShare IP server's User & Group datafiles current with the same information.

Print and Mail services can be installed on separate servers.

Question 8: What is the Users & Groups Data File backup?

Answer: It gets created when you launch Web/File server admin. This file is created the first time you launch Web/file server items, and is intended as a backup of Users & Groups data in case you want to go back to earlier versions of AppleShare. It does not get updated beyond creation, and it is documented in readme file.

Question 9: Where is serial number stored?

Answer: It is stored in the Users & Group data file.

Question 10: Can I move my Users & Groups data file to a new System folder after I do a Clean Install or move the server to a different computer?

Answer: Yes, you can move the data file. See the AppleShare IP 5.0 Admin Manual section Appendix D - Changing the Startup Disk for additional information.

Question 11: How can I delete an entire group of users, that is the Class of '98 group and all of its users?

Answer: There is no easy way to do this. The group can be eliminated simply enough but the flexibility of users belonging potentially to different groups makes it difficult to do batch user deletions. There are some workarounds described in the manual starting on page 100.

Question 12: In the ANAT (Apple Network Administrator Toolkit) Users and Groups Manager you can import groups, but you cannot turn on mail. In AppleShare IP users and groups you can turn on mail, but you cannot import groups. Any suggestions for doing both? Will the Santorini Server Manager do this?

Answer: Santorini's Server Manager does allow the importing of users and groups from text files. In addition, you can enable mail for these users after they have been imported.

AppleShare IP 5.0: AppleShare Client (FAQ)

This article contains frequently asked questions (FAQ) regarding AppleShare Client for AppleShare IP 5.0, with answers to those questions. Additional AppleShare IP FAQ's are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Is Open Transport required on the Macintosh client?
2. Can I force an AppleTalk connection to an AppleShare IP 5.0 server?
3. Does the AppleShare Client v3.7 resolve the performance problem of earlier clients such as System Software v.7.5.3 Finder's asynchronous calls?
4. Is there a Windows AppleTalk client included with AppleShare IP 5.0?
5. Can I use a remote server alias from a Mac OS client to connect to my AppleShare IP 5.0 server?

Question 1: Is Open Transport required on the Macintosh client?

Answer: Yes. Open Transport 1.1.2 is required.

Question 2: Can I force an AppleTalk connection to an AppleShare IP 5.0 server?

Answer: Yes. Hold down the "option" key as you select the server name in the Chooser window.

Question 3: Does the AppleShare Client v3.7 resolve the performance problem of earlier clients such as System Software v.7.5.3 Finder's asynchronous calls?

Answer: Yes. The ReadMe file for AppleShare Client v3.7 details all such software improvements.

Question 4: Is there a Windows AppleTalk client included with AppleShare IP 5.0?

Answer: Yes. AppleShare Client for Windows 3.x and COPSTalk for Windows 95 are included on the Companion CD.

Question 5: Can I use a remote server alias from a Mac OS client to connect to my AppleShare IP 5.0 server?

Answer: Yes. However, the following suggestions may help ensure that the connection works properly.

- Lock the remote server's alias using the Get Info window. This ensures that the connection information is stored correctly for dial-up procedure. If you don't do this, you may lose this information and may not be able to access the remote server properly.
- Make sure that the remote server connection is not timing out before it mounts on the computer desktop. You can change the timeout length by editing the 'DATB' 1410 resource in the AppleShare file located in the Extensions folder. Apple's ping timeout has been set to 20 seconds. The timeout is measured in ticks and currently set to 1200 ticks. 60 ticks = 1 second.

Note: You assume all risks involved in editing Mac OS resources. Apple, Inc. is not responsible for any problems that can occur.

AppleShare IP 5.0: File Service (FAQ)

This article contains frequently asked questions (FAQ) regarding AppleShare IP 5.0 File Service, with answers to those questions. Additional AppleShare IP FAQ's are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Will the fastest network connection be selected between the client and AppleShare IP 5.0 server? Or will it always try TCP/IP when both TCP/IP and AppleTalk are available?
2. How does the AppleShare client know how to connect to the server using IP?
3. Does AppleShare IP 5.0 now support sharing volumes larger than 4GB?
4. Can I change the AppleShare server's port? I changed the PORT resources to a range of ports made available to me by the network administrator. When I try to log into the AppleShare server via the Chooser, a 'server not responding' message is displayed.
5. Will my Windows clients be able to use AFP over IP as well?

Question 1: Will the fastest network connection be selected between the client and AppleShare IP 5.0 server? Or will it always try TCP/IP when both TCP/IP and AppleTalk are available?

Answer: The AppleShare IP 5.0 file server will default to an AFP over TCP/IP connection unless not available. This is considered the fastest connection. The client can force an AppleTalk connection by using the method described in the AppleShare IP 5.0 AppleShare Client FAQ .

Question 2: How does the AppleShare client know how to connect to the server using IP?

Answer: The AppleShare IP 5.0 server sends its IP address to the client in an Appletalk packet when it's selected in the client's Chooser. The AppleShare client then knows to select the TCP/IP protocol for connection.

Question 3: Does AppleShare IP 5.0 now support sharing volumes larger than 4GB?

Answer: Yes. When used in conjunction with AppleShare Client v3.7 from the Mac OS client, server volume sizes are read correctly up to 4 GB. If the volume is actually larger than 4 GB, the volume size information shown will reflect the remaining available disk space.

For example, if the volume is 9GB and 5.5GB of disk space is used - the Mac OS client will see 3.5GB as available. In turn, if the volume is 10GB and 5.5GB of disk space is used - the Mac OS client will only see 4GB as available.

AppleShare Client prior to version 3.7 can only read up to 2GB for volume size. Same rule above applies for reading volume sizes.

Question 4: Can I change the AppleShare server's port? I changed the PORT resources to a range of ports made available to me by the network administrator. When I try to log into the AppleShare server via the Chooser, a 'server not responding' message is displayed.

Answer: The AppleShare client looks for the AppleTalk over TCP/IP port number to be 548. The AppleShare client won't be able to connect to the server if this is changed. There are two ways you can connect to an AppleShare server whose PORT resource has been changed.

1. Use the Chooser's "Server IP Address..." button to manually specify the IP address of the server, followed by a colon and the new port number. For example: www.yourdomain.com:xxxx

2. Change the default AppleShare port number from the Mac OS client by altering the 'DATB' resource (ID=1407) to match that of the server's new AFP port number.

Note: The client won't be able to connect to another AppleShare IP 5.0 server whose port number has not been altered, unless you manually connect using the Chooser's "Server IP Address..." button and explicitly specify the port number after the "colon" notation.

Question 5: Will my Windows clients be able to use AFP over IP as well?

Answer: Cooperative Printing Solutions (makers of COPSTalk) and Miramar have announced products update that will include support for AFP over TCP . Please contact the vendors for more information.

AppleShare IP 5.0: MacDNS (FAQ)

This article contains frequently asked questions (FAQ) regarding MacDNS for AppleShare IP 5.0, with answers to those questions. Additional AppleShare IP FAQ's are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

MacDNS

1. Should I set up my MacDNS server to point to itself for domain name services?
2. I want to set up an Intranet which will not have access to the Internet. Can this be done with MacDNS?
3. How do I set up an mx-record?

Miscellaneous

1. Can I still use ARA MultiPort Server on my AppleShare IP file server?
2. Can I use ARA Personal Server on my AppleShare IP 5.0 server?
3. What are the port numbers used by the various AppleShare IP services?
4. What is Multi-homing? Does it mean I can route different network segments through my AppleShare IP server?

MacDNS

Question 1: Should I set up my MacDNS server to point to itself for domain name services?

Answer: Yes. You should list the server's domain name in the Name Server Address field of the TCP/IP control panel. You can also include a second DNS server, such as your ISP's.

Question 2: I want to set up an Intranet which will not have access to the Internet. Can this be done with MacDNS?

Answer: Yes. Please see article 32004: **MacDNS Frequently Asked Questions (FAQ)** for details.

Question 3: How do I set up an mx-record?

Answer: Please see article 32004: **MacDNS Frequently Asked Questions (FAQ)** for details.

Miscellaneous

Question 1: Can I still use ARA MultiPort Server on my AppleShare IP file server?

Answer: If ARA MultiPort Server is installed on the server prior to installing AppleShare IP 5.0, Users who were configured properly can continue to call in; however, you can't change their access information, since these options are not in Users & Group data.

Question 2: Can I use ARA Personal Server on my AppleShare IP 5.0 server?

Answer: Yes. However, you must first install ARA Personal Server, set up your users for dial-in access through the Users & Groups control panel, and then install AppleShare IP. Once AppleShare IP is installed you cannot make additional changes to the User's dial-in access. An unsupported Apple utility is being developed to administer the user's ARA options after AppleShare IP 5.0 is installed.

Question 3: What are the port numbers used by the various AppleShare IP services?

Answer:

- AFP over TCP 548
- FTP 21
- HTTP 80
- POP3 110
- SMTP 25
- Domain Name Server 53

Question 4: What is Multi-homing? Does it mean I can route different network segments through my AppleShare IP server?

Answer: Multi-homing is the ability for one computer to be connected to up to 4 different and unique AppleTalk network segments. This is done by connecting to multiple network ports through built-in and expansion cards. It does not bridge or route those network segments into a Local Area Network (LAN). The network segments will not see each other by being connected to this one computer. The AppleShare IP AppleShare file server can use this feature.

AppleShare IP 5.0: Mail Service (FAQ)

This article contains frequently asked questions (FAQ) regarding Mail Service for AppleShare IP 5.0, with answers to those questions. Additional AppleShare IP FAQ's are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Can mail clients have accounts on the Mail server if the available network only supports AppleTalk?
2. Can the Mail Server support TCP/IP and AppleTalk clients simultaneously?
3. How can I troubleshoot mail delivery problems?
4. How can I adjust the number of days the mail server will attempt to deliver mail before returning it to sender?
5. Can a default SMTP mail server be set for mail forwarding instead of all hosts?
6. What is the size limit of enclosures the mail server can handle?
7. What do SMTP and POP connections mean?
8. How can I activate email for an entire group during the import, but keep the user name as the email address?
9. How do I set up an AppleShare IP mail server on separate Workgroup Servers using only one AppleShare IP serial number.
10. Does installing the mail portion of AppleShare IP on a separate computer turn off Mac OS File Sharing?

Question 1: Can mail clients have accounts on the Mail server if the available network only supports AppleTalk?

Answer: Yes. The bundled mail server can support AppleTalk clients. The Claris Emailer application has to be set for ClarisOffice service. The client will then select the Mail Server over AppleTalk.

Question 2: Can the Mail Server support TCP/IP and AppleTalk clients simultaneously?

Answer: Yes. The client software will have to be set up according to the protocol used. Claris Emailer from the client side can be used for AppleTalk access through the ClarisOffice service.

Question 3: How can I troubleshoot mail delivery problems?

Answer: Check the suggestions below.

- Confirm that your network's router or Internet gateway allows incoming and/or outgoing SMTP mail delivery.
- Confirm that you are setting up your mx record for recipient host correctly.
- Confirm that port 25 for SMTP connections is enabled on the receiving mail server.

Question 4: How can I adjust the number of days the mail server will attempt to deliver mail before returning it to sender?

Answer: You can change the number of hours after which the Mail Server stops trying to deliver a mail message by following the steps below. By default it is set to 72 hours.

1. Open the Mail Admin program.
2. Choose Mail Server Settings from the Mail Admin program's Server menu
3. Choose Mail Routing from the pop-up menu.
4. Type a new number in the Current text box.
5. Click Save.

Question 5: Can a default SMTP mail server be set for mail forwarding instead of all hosts?

Answer: Mail forwarding can be set for either a single User or an unknown mail server outside your network.

Question 6: What is the size limit of enclosures the mail server can handle?

Answer: The AppleShare IP 5.0 mail server does not limit the file size it sends or receives. The mail administrator can set the amount of hard disk space used by the mail database.

Question 7: What do SMTP and POP connections mean?

Answer:

- SMTP (Simple Mail Transfer Protocol) is used by the mail client to send messages to a SMTP server as well as from one SMTP server to another SMTP server.
- POP3 (Post Office Protocol) is used from a client to receive mail on the mail server.

Question 8: How can I activate email for an entire group during the import, but keep the user name as the email address?

Answer: Use a valid Internet name as the user account name. The Internet field can by left blank if the user name is a valid Internet name, that is, no spaces between first and last name. Use underlines or dots instead of spaces. The manual does not clearly indicate this, but it does list valid Internet alias characters, see page 87. Some email clients will allow spaces but you have to put quotes around the name, other email clients will not allow this.

Question 9: How do I set up an AppleShare IP mail server on separate Workgroup Servers using only one AppleShare IP serial number.

Answer: Please refer to article 22081: "**AppleShare IP 5.0 and Mail Forwarding"** for information on this question.

Question 10: Does installing the mail portion of AppleShare IP on a separate computer turn off Mac OS File Sharing?

Answer: The separate mail server has to use the AppleShare IP Users & Groups file and registry. These items are not compatible with Personal File Sharing. Therefore, you cannot use Personal File Sharing on a standalone AppleShare IP Mail server.

AppleShare IP 5.0: Web Service (FAQ)

This article contains frequently asked questions (FAQ) regarding Web Service for AppleShare IP 5.0, with answers to those questions. Additional AppleShare IP FAQ's are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Are there any common CGI's that are not compatible with ASIP?
2. Does the AppleShare IP 5.0 web server have Web* API plug-in support?
3. How many simultaneous connections can this Web server handle?
4. Does guest access need to be on to allow Web Access (if you want access to a public area of the Web folder)?

Question 1: Are there any common CGI's that are not compatible with ASIP?

Answer: Due to the huge number of publicly available CGI's, Apple cannot test them for compatibility. Please contact CGIdeveloper's for this information. If they are written to the Web* CGI API, they should be compatible.

Question 2: Does the AppleShare IP 5.0 web server have Web* API plug-in support?

Answer: No, AppleShare IP 5.0 does not currently have Web*API support.

Question 3: How many simultaneous connections can this Web server handle?

Answer: The number of simultaneous connections are limited by your physical network connection and amount of RAM installed on your AppleShare IP 5.0 server.

Question 4: Does guest access need to be on to allow Web Access (if you want access to a public area of the Web folder)?

Answer: No. But if guest access is not enabled, you will need to provide at least one valid AppleShare IP account that has privileges to the Web folder. See page 95 in the manual for more detail.

AppleShare IP 5.0: Tips Using the Web Server Automatic Directory Listing

This article contains tips and additional information about using the Automatic Directory Listing feature in the AppleShare IP 5.0 Web Server.
This article has been archived and is no longer updated by Apple.
The Web Server supports Automatic Directory Listing. With Automatic Directory Listing, if you browse a URL that is a folder, the Web & File Server automatically produces a clickable directory listing of the contents of the folder. However you must have the appropriate access privileges.

You can override the automatic directory listing by placing a file named *index.html* in the folder. If a file named *index.html* resides in the folder when a URL for that folder is specified, the Web & File Server displays the contents of *index.html* instead of the clickable directory listing.

There is no way to specify another default document named something else, such as default.html, instead of index.html.

Accessing a Folder on the Sever that is not the Specified Web Folder

The information in this section pertains to accessing a folder that is not the specified Web Folder, such as a folder within the Web Folder.

- If the *index.html* file, or the file specified as the default home page, is removed from the Web Folder or renamed, then an error stating "-404 error File Not Found" appears. The AppleShare Web Server does not provide an Automatic Directory Listing of the selected Web Folder, only other folders.

- If you choose another folder to be the Web Folder, you have to choose another file to be the default home page; the AppleShare Web Server will not let you change the web folder without changing the home page file.

- Folders in the Web Folder that are accessed using the *index.html* listing should not contain spaces. However, when using the Web Server Automatic Directory Listing, non-standard HTML characters are translated into proper links, which can be clicked on.

- Administrators can see the Short Name that Microsoft Window users will see when they connect to the server, standard MS Windows 8.3 file names, by choosing Disks & Share Points from the Server menu then selecting one of the disks/folders/files or share point and choosing Short Name from the Server menu. When a file is copied to a Windows client, the server changes the name to the name shown by Short Name.

Mac OS 8 and 9: Personal File Sharing User Limits

This article describes limitations of Personal File Sharing for Mac OS 8 and Mac OS 9.
This article has been archived and is no longer updated by Apple.
In Mac OS 8 and Mac OS 9, personal file sharing does not have a fixed user limit. Available memory and hard drive space are the only functional restrictions. Thousands of different users can be created using the Users & Groups control panel in Mac OS 8 and Mac OS 9.

However, there are certain other restrictions on personal file sharing.

Personal File Sharing Restrictions

- No more than 10 users at one time can be connected.
- No more than 10 volumes can be shared.
- No more than 10 folders can be shared.
- Cannot transfer a file that is larger than 2 GB.

If Mac OS 8 or Mac OS 9 personal file sharing does not fit your file sharing requirements, look at a dedicated solution such as Mac OS X Server.

Mac OS X client (all versions) can transfer files larger than 2 GB when connected to a server that supports version 3.0 of the AppleTalk Filing Protocol (AFP), such as Mac OS X Server 10.1.

PowerBook: Proper Method for Exchanging Expansion Bay Modules

This article provides information on how to properly exchange expansion bay devices in various PowerBook models.
This article has been archived and is no longer updated by Apple.
In all PowerBook models that have expansion bay capability, you need to first unmount and remove any media inserted into the expansion bay module. Failure to do so could cause loss of data. You should not remove the expansion bay module while the in-use light for the device is on or flashing.

So for example, with a floppy module you would need to quit all applications and close all files that are located on the floppy disk. Then eject the floppy disk and then proceed with removing the expansion module.

PowerBook 5300 series and 190 series

Apple suggests that the computer be turned off before removing an expansion bay module, although no damage should occur if the computer is asleep and the module follows Apple specification guidelines.

PowerBook 1400 series
Modules can be switched or removed while the PowerBook is turned off or in sleep mode.

Note: The PowerBook 1400 expansion bay modules are not interchangeable with other PowerBook computers.

PowerBook 3400 series
Modules can be switched or removed while the PowerBook is turned on, in sleep, or shut down. Do not switch modules while the computer is starting up, this could cause lost of data and may have unexpected results.

PowerBook G3

Modules can be switched or removed while the PowerBook is turned on, asleep, or shut down. Do not switch modules while the computer is starting up; this could cause loss of data and may have unexpected results.

PowerBook G3 Series

Storage devices for the expansion bays are hot-swappable. There is no need to turn the system off or put it into sleep mode to exchange storage devices such as CD-ROM, DVD-ROM, Zip, or floppy disk drives. However, you must unmount any media from the storage device before commencing a hot swap.

PowerBook G3 Series (Bronze keyboard)

Storage devices for the expansion bays are hot-swappable. There is no need to turn the system off or put it into sleep mode to exchange storage devices such as CD-ROM, DVD-ROM, Zip, or floppy disk drives. However, you must unmount any media from the storage device before commencing a hot swap.

PowerBook G3 Series expansion bay devices are not compatible with the PowerBook G3 Series (Bronze keyboard) as the expansion bay has a different height specification.

PowerBook (FireWire)

Storage devices for the expansion bays are hot-swappable. There is no need to turn the system off or put it into sleep mode to exchange storage devices such as CD-ROM, DVD-ROM, Zip, or floppy disk drives. However, you must unmount any media from the storage device before commencing a hot swap.

Some PowerBook G3 Series (Bronze keyboard) expansion bay modules may not be compatible with the PowerBook (FireWire) although they may physically fit. Check with the vendor of the device for compatibility.

Non-Apple Expansion Modules

For third-party, non-Apple branded, expansion modules check with the vendor of the module to see if any special precautions should be followed.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

QuickTime 3: Product Description and Specifications

This article contains the Quicktime 3 product description and specifications
This article has been archived and is no longer updated by Apple.

Features

- Pervasive playback standard for CD-ROM and Internet content. With more than 2,500 leading title developers already licensing QuickTime, and over 100 new QuickTime enhanced titles introduced each month, QuickTime remains as the standard format for CD-ROM and Internet content delivery.
- Support for multiple data types. QuickTime enables developers to provide customers such unique features as multiple-language text tracks. Data types supported include video, sound, graphics, animation, text, music/MIDI, MPEG, sprite, 3D, and VR.
- Multiplatform playback. Develop once and deliver on many platforms. Avoid time-consuming platform conversion tasks and reach millions of Macintosh and Windows users. Multiplatform media file format allows easy production of "hybrid" disks.
- Built-in synchronization. QuickTime makes it easy to synchronize sound, video, music, and other data tracks to a common time base.

Description

QuickTime is Apple Computer's industry standard software architecture for creating, editing, and publishing digital media. QuickTime is at the foundation of some of the industry's most respected digital media software tools, including Adobe After Effects, Avid Cinema, Adobe Premiere, Radius Edit, and Macromedia's much-anticipated Final Cut.

QuickTime also provides the most reliable way to deliver digital media to a variety of computer platforms. That's why top computer entertainment companies like Broderbund, Voyager, Cyan, Macromedia, Pixar, Microsoft, Disney, and CNN all use QuickTime to deliver digital video. QuickTime provides the high level of performance, compatibility, and quality that these companies demand to deliver their products.

The QuickTime movie file format enables seamless exchange of digital media between nearly all digital media tools. QuickTime movie files are used in a wide range of situations ranging from professional video editing stations from Scitex and Media 100 to over half of the video found on the internet.

For the first time with QuickTime 3, the full range of QuickTime media creation, editing, and publishing functionality is now available on the Windows 95 and Windows NT platforms, in addition to Mac OS. QuickTime 3 now provides unprecedented power and flexibility for QuickTime customers on all the major desktop computer platforms.

QuickTime 3 contains literally dozens of significant new capabilities to assist media authors and application developers to work more effectively with QuickTime.

QuickTime features major enhancements to its media interchange architecture to support full interoperability with a wider range of professional media file formats, including the AVI, OpenDML, OMF, and DVCam formats.

QuickTime 3 introduces rich support for DVCam media streams to the base architecture. The release provides software-only or hardware-accelerated playback, editing, and creation of DVCam streams in any QuickTime application.

QuickTime also integrates flexible real-time effects and transitions capabilities. QuickTime now standardizes access to software-based and hardware-accelerated effects features within an open, scalable, and extensible architecture. Read on for more information on how the advanced architecture and rich feature set QuickTime 3 offers benefit both media content authors and application developers.

Component Architecture

QuickTime isn't just one single piece of software, QuickTime is a collection of over 175 different software components that work seamlessly. These software components are divided into over 20 different categories, with each one providing a particular service. This component architecture allows QuickTime to be continuously updated to support new technologies by adding new components or enhancing existing ones. Developers, too can add their own software components, allowing their technology to take advantage of all the benefits of QuickTime integration.

Hardware

One of the key features of the QuickTime software architecture is that it provides an abstraction layer that enables applications to be created with no dependencies on the underlying media hardware. Because computing power increases so rapidly, a decompression algorithm that required an add-in hardware board to provide full motion playback two years ago can now be completely implemented in software. Without QuickTime, applications would ordinarily interact directly with the media hardware, resulting in less robust, less compatible application behavior.

Because QuickTime provides a well defined hardware abstraction layer, applications are isolated from the underlying media technologies. This abstraction means that applications are always ready to take advantage of the latest hardware technology advances such as MMX and multiprocessing.

Platforms

Digital media is created on a variety of computing platforms for delivery on an even wider variety of platforms. QuickTime has long supported the

ability to deliver digital media to a range of computing platforms. QuickTime 3 adds the ability to capture, edit, and compress digital media on the same range of platforms. This strong multi-platform support gives developers and customers a choice in both their development and delivery platforms, while maintaining the consistent and reliable results that QuickTime has always provided.

Media Types

While most digital media content creation focuses on sound and video, there are many other kinds of media that are used on a daily basis. The QuickTime architecture is capable of handling any time based media, going well beyond just sound and video. By providing a unified architecture for working with all time based media, QuickTime simplifies the creation and delivery of all kinds of media. By standardizing how important media types such as text, time code, MIDI, and 3D are combined with video and sound, QuickTime enables applications easily integrate all kinds of media to create compelling media presentations.

Digital Capture Media Types

In addition to the ability to play-back and edit digital media, QuickTime contains a complete architecture for digital media capture. Beyond providing services for the synchronized streaming capture of digital video and audio in a variety of formats from a wide range of sources, QuickTime also provides standard user interface elements which enable applications to easily integrate capture support. QuickTime's digital capture solutions are flexible enough to be used both to capture broadcast quality video and for video conferencing applications. And QuickTime supports a variety of media types for capture including MIDI and text, making it easy to synchronize the acquisition of almost any kind of media.

Digital Media File Formats

Professionals who create digital media every day work with a variety of media file formats. Different kinds of media are stored in different kinds of files. QuickTime provides a solution to this mixed media chaos in two ways. First, the QuickTime software architecture enables QuickTime based applications to easily work with a wide variety of industry standard media file formats. Second, the QuickTime movie file format provides a powerful container with the ability to contain nearly any kind of digital media. The QuickTime movie file format is so well suited to professional media storage, that Silicon Graphics has announced their intention to standardize on QuickTime movie files for all their sound and video storage.

In addition to complete support for the QuickTime Movie format, QuickTime supports a long list of digital media file formats. The QuickTime software architecture allows support for new file formats and these may be plugged in at any time as they emerge.

Compressed Data Formats

In the digital video and audio markets, a variety of different compression technologies are used. Each technology was created to meet the need of a particular market. For example, Cinepak was created to deliver video from CD-ROMs, Motion JPEG Format A to edit broadcast quality video, and ClearVideo to deliver video on the internet. During the course of creating and delivering a digital media production, several different formats may be used.

The QuickTime software architecture enables almost any compression technology to be integrated with QuickTime. Creators of digital media content have the freedom to choose the best compression format for the job.

Export Formats

Just as it is important to be able to bring any digital media file formats into QuickTime, it is also important to be able to easily put media from QuickTime movie files into other standard media formats. QuickTime provides the basis for a great system for creating, editing, and delivering digital media. In some cases, the delivery platform for the digital content may not support QuickTime movie files directly, for example a DVCam video tape. In this case, it is necessary to be able to easily encode a QuickTime movie into the DVCam format. QuickTime has the built-in ability to export to a variety of standard digital media formats, and the extensibility to add support for other digital media formats as needed.

Component Architecture

- Image Decompressor
- Data Decompressor*
- Image Compressor
- Capture Channel
- Sound Decompressor
- Capture Interface Panel
- Sound Compressor
- Graphics Format Importer
- Data Handler
- File Previewer
- Media Handler
- Musical Instrument Provider
- Clock
- Software Music Synthesizer
- Image Transcoder
- Sound Mixer
- Movie Controller

- Interpolator
- Movie Importer
- Video Digitizer
- Movie Exporter
- Audio Digitizer

Hardware Abstraction

- Clock/Timers
- Sound Mixing
- Sound Output
- Digital Media Capture
- Image Compression
- Media Storage
- Image Compositing
- MIDI Synthesis
- Sound Compression
- 3D Rendering

Media Types

- Video
- MIDI
- Sound
- Sprite/Animation
- Text
- Tween
- Timecode
- MPEG
- 3D
- VR

Compressed Data Formats

Video Formats

- JPEG
- Animation
- Motion JPEG Format A
- Apple Graphics
- Motion JPEG Format B
- Cinepak
- AVR (Avid Video Resolution)*
- Windows RLE*
- OpenDML Motion JPEG*
- GIF
- YUV 4:2:2
- Photoshop
- YUV 4:1:1
- Vector Animation*
- RGB
- DVCam*
- ARGB
- H.263*
- Windows Uncompressed*
- MPEG
- Apple Video
- CCIR 601

Supported through additional third party extensions:

- ClearVideo*
- Indeo Video Interactive *
- TrueMotion
- H.261*
- Indeo 3.2

Audio Formats

- PCM
- 32-bit IEEE Floating Point*
- 64-bit IEEE Floating Point*
- IMA ADPCM
- MACE 3:1
- uLaw
- MACE 6:1
- DVCam*

Supported through additional third party extensions:

- G.723*
- GSM*
- G.728*

Digital Media File Formats

Digital Video

- AVI*
- MPEG
- OpenDML*
- DVCam*
- OMF*

Digital Audio

- AIFF/AIFC
- AU
- Wave
- MPEG Layer 2
- Sound Designer II*

Still Image

- QuickTime Image File
- JPEG/JFIF
- Photoshop

Connect To: How to Change the Default URL

This article tells how to change the default URL used by the Connect To applet, and how to create your own Connect To applet using AppleScript.

This article has been archived and is no longer updated by Apple.
Connect To is an AppleScript applet that has a custom icon and whose file type and creator codes have been changed. If you want Connect To to use a different default URL, you can modify the applet or create your own applet. Each is explained below.

Creating Your Own Applet

The functionality of Connect To has been integrated into the Network Browser application program included with Mac OS 9. If you do not currently have Mac OS 9, or would simply like to create your own Connect To applet, please see article 60599: "**Mac OS 9: Where is 'Connect To...'**"

Modifying the Connect To Applet

You can modify the Connect To applet by first setting its file type and creator codes to match those of a standard AppleScript applet, and then modifying the applet with an AppleScript editor. Here is the procedure:

1. Make a copy of the Connect To applet.

2. Using a resource editor, change the file type and creator codes to 'APPL' and 'aplt', respectively. If you wish to restore these original values later, record them now. Changing the codes does not alter the applet's functionality; it merely makes the applet editable by an AppleScript editor.

3. Drop the resulting file onto the Script Editor application for editing. (Mac OS 8 and 9 install the Script Editor by default in the Apple Extras folder.)

4. Substitute another URL for the one shown in the line "set defaultURL to 'http://www.apple.com'."

5. Save the new file using Save As. The resulting applet does not have a custom icon, but this does not affect its operation.

The original file type and creator codes can be restored to their previous values, though it is not necessary to do so.

Note: Apple does not provide technical assistance in the use of ResEdit or other such resource editing utilities.

You can make as many modified copies of Connect To as you like, but this is not the most efficient way to open frequently used URLs. Most Web browsers and ftp utilities allow you to save bookmark files to any location on your hard disk. Bookmark files are typically smaller, easier to change, and take you directly to the desired Internet location.

Computer Equipment: Turning It Off Versus Leaving It On

This document raises points to consider when deciding if you should leave computer equipment on or turn it off when it is not in use. Generally, you should turn off equipment if it is going to be idle for eight hours or more. For idle periods of less than eight hours, use Energy Saver software to optimize energy use.
This article has been archived and is no longer updated by Apple.
Here are three major points in the discussion regarding whether to leave computer equipment running continuously, followed by a conclusion.

Energy Usage

Equipment that is left running continuously uses a certain amount of energy, which is a concern for some people. The Energy Star program, along with Apple's energy-saving software, addresses this issue.

The United States Environmental Protection Agency (EPA) and Natural Resources Canada Energy StarÂ® program is a voluntary partnership with office product equipment manufacturers to promote products that exceed guidelines for energy efficiency. Reducing energy consumption of office products saves money and reduces pollution by eliminating wasted energy. As an Energy Star partner, Apple is committed to the development of energy efficient products and many Apple products meet Energy Star guidelines.

In addition to products that are Energy Star compliant, Mac OS includes software that you can use to further cut down on energy usage, including the Energy Saver control panel (Mac OS 8 and 9) and the Energy Saver pane of System Preferences (Mac OS X).

Stress on Equipment

Some people believe that turning equipment on and off (for example, once each day) can, over a long period, put stress on equipment. Therefore, they argue that equipment should be left on, whether in energy-saving sleep mode or not. Others believe that leaving equipment turned on makes it more vulnerable to power fluctuations, which could put stress on equipment. Therefore, they believe that equipment should be turned off when not in use.

Lightning, Spikes, and Surges

Some people feel that the risk of damage to equipment from lightning strikes, power spikes, and power surges is great enough to warrant turning off equipment whenever it is not in use. Others, who may rarely (or never) experience such phenomena, give more weight to the benefits of leaving equipment turned on.

Conclusion

With equipment that is Energy Star compliant and in areas where there are no issues with the quality or dependability of power, you may want to consider turning off equipment if it is going to be idle for eight hours or more. For idle periods of less than eight hours, use Energy Saver software to optimize energy usage.

For more information on energy saving and the Energy Star program, refer to the following documents:

Document 12346: "**Energy Star: Description**"
Document 12345: "**Energy Star: Registered Apple Products**"
Document 18127: "**Energy Saving Control Panels: Description & Compatibility**"

AppleShare IP Third Party Server Management Products

This article provides information about software and hardware products that work with AppleShare IP to provide enhanced or additional capabilities.
This article has been archived and is no longer updated by Apple.

AppleShare File Server (AFP) Server Management

AFP Logger is an application which works with your AppleShare IP file server to log accesses to that server. Items logged include the name and address of users logging into the file server, bytes transferred, time connected, and files opened and deleted by those users. AFP Logger also provides a real-time display summarizing overall access to the file server. Open Door Networks, Inc.

Assimilator is a powerful Macintosh lab management tool designed for situations where you wish to make a large number of Macintoshes look virtually identical. Assimilator periodically restores the content of the local hard disks from a source image on an AppleShare file server. Stairways Software.

Disk Quota For years, AppleShare administrators have yearned for a system of automatically enforcing limits on the amount of disk space users can have on a server. Now, with Disk Quota, an administrator can easily set up such limits for each user on each AppleShare server, without having to continually monitor disk usage and notify users when they have exceeded their limits. Santorini consulting & design, inc.

IPNetMonitor provides a set of ten integrated Internet tools which allow Macintosh users to monitor their connection to the Internet. With IPNetMonitor, you can see how the Internet is working, monitor the flow of data to and from your computer, and trace the route by which the data is flowing. This gives the user the information to both optimize internet service and diagnose problems. The tools include Test Connectivity, Trace Route, Name Server Lookup, Who Is, Finger, Monitor, TCP Info, Connection List, Address Scan, and Subnet Calculator. Check the Sustainable Softworks web site for more information or to download an evaluation copy.

John's Lab Pak is a collection of small applications written by John Ostrowick, to provide a complete mac lab solution. Includes tools for remote manipulation of macs, the addition and removal of users, plus a login system. Freeware, Labtools. Some parts still under development.

MacAdministrator works on your network to provide a raft of administration, auditing and control features including logon, protection, printing control and software distribution.Hi Resolution

OT Advanced Tuner allows you to optimize TCP/IP network performance under Macintosh Open Transport by tuning internal TCP/IP parameters to match your network environment. The Tuner supports over 30 adjustable parameters including the TCP Window Size, Time Out intervals, Maximum Segment Size, and MTU. Check the Sustainable Softworks web site for more information or to download an evaluation copy.

OTSessionWatcher is a TCP network and application debugging tool. It allows you to examine the data transmitted through Open Transport TCP streams such as those used in AppleShare IP connections as well as those used by web browsers and FTP clients. Stairways Software.

PageSentry is the "virtual assistant" that constantly watches all of your servers and lets you know if any critical service fails. Use PageSentry to monitor all types of servers, including AppleShare, Web, Mail, FTP and DNS. The key to PageSentry's reliability is that it tests your servers by making actual client requests of the server. Visit the Maxum Development Web site for more information and a free demo copy. Maxum Development Corporation

Server Manager is comprehensive management software for AppleShare servers. With Server Manager you can manage your servers remotely, from any Macintosh, anywhere, manage multiple servers simultaneously, share data between them, build related server reports and restrict server access and disconnect idle users. Santorini consulting &design, inc.

Server Tools is a comprehensive suite of ten utilities that allows you to more effectively and efficiently manage your servers, including AppleShare servers, mail servers, database servers, or any other type of server. With Server Tools, you can detect and avert problems, improve security, manage disk space, and maintain audit trails. Santorini consulting & design, inc.

Server Tracker is the only product that allows you to track changes to your AppleShare servers' folders and files. Server Tracker records which users open, delete, rename or move folders and files, along with the time at which these events occurred. Santorini consulting &design, inc.

AppleShare IP Third Party TCP/IP Router Products

This article provides information about software and hardware products that work with AppleShare IP to provide enhanced or additional capabilities.
This article has been archived and is no longer updated by Apple.

TCP/IP Routers

IPNetRouter provides IP multihoming and routing under Macintosh Open Transport. With IPNetRouter, you can use multiple IP interfaces at the same time (such as Ethernet and OT/PPP for example), and specify additional routes for communicating with more than one IP gateway. The built-in IP Masquerading feature allows an entire network to simultaneously share a single Internet connection and end user account. IPNetRouter's OT native design offers superior performance with greatly reduced cost and complexity. Check the Sustainable Softworks web site for more information or to download an evaluation copy.

The Vicomsoft Internet Gateway allows an entire network of users to simultaneously share Internet access via one Internet account, one access device (including modem/ ISDN/ cable-modem/ ADSL/ T1/ existing router) and one phone or ISDN line.

The Internet Gateway is a flexible, fully featured, easy to configure TCP/IP software router that incorporates a DHCP server for easy client set-up, a full PPP server for dial-in access with support for multiple users, and a firewall to protect your LAN from the Internet. CyberNot filter support can prevent access to inappropriate sites, and protocol blocking enables restrictions to be made on the type of Internet traffic allowable. Can be used to interconnect different TCP/IP networks, both local area and wide area--such as head and branch offices--with full support for dial-on-demand and leased line networking, and now supports Vicomsoft Multihosting. Check the Vicomsoft web site for an evaluation copy. copy.Vicomsoft

Vicomsoft SoftRouter is a fully featured, easy to set up TCP/IP software router. It routes traffic between ethernet, token ring, MacIP, leased line and dial-up TCP/IP networks, with the added feature of true IP Multi-hosting.

Vicomsoft Multi-hosting allows Web Masters to run multiple Web servers (domain names) on a single Mac OS computer. SoftRouter works with any Web server and is transparent to all web browsers. SoftRouter can be used to interconnect different TCP/IP networks, both local area and wide area, with full support for dial-on-demand networking. A full PPP Server is incorporated supporting dial-in users. Check here for a live example of Multi-hosting. Check the Vicomsoft web site for an evaluation copy of SoftRouter.Vicomsoft

Apple Hardware Test for iBook version 1.2.1, Read Me

Apple Hardware Test for iBook version 1.2.1 is distributed only with the Apple iBook, September, 2001; it will not work with any other computer.

This article has been archived and is no longer updated by Apple.

About Apple Hardware Test

Apple Hardware Test is a diagnostic tool for detecting problems with your computer's internal hardware components such as the logic board, memory, modem, video RAM, and Apple's AirPort card. It does not check externally connected hardware components such as USB drives or FireWire devices; it does not check non-Apple devices such as PCI cards from other vendors.

Before using Apple Hardware Test, disconnect external devices (excluding Apple keyboard, mouse, display, and speakers), and remove any non-Apple cards that were not included in the original shipping configuration of your system.

Apple Hardware Test does not check your computer for problems with the Operating System (OS) or other software related problems such as application or extension conflicts.

To use the Apple Hardware Test CD, restart your computer while holding down the C key until the "Loading..." icon appears, then you may release the C key. Loading will take approximately 45 seconds. Apple Hardware Test's main screen will appear. Follow the on-screen instructions and recommendations.

Apple Hardware Test for iBook version 1.2.1 is distributed only with the Apple iBook; and will not work with any other computer.

If you suspect your computer has a hardware problem, the information provided by Apple Hardware Test can help identify the problem. If Apple Hardware Test detects a problem, an error code will be displayed. Please make a note of the error code before pursuing support options. If no hardware failure is detected, the problem may be software relate

Known issues

Apple Hardware Test can not be used when a mouse is directly connected to the USB port on the iBook. Please connect the mouse to a USB keyboard if available, or use the trackpad instead.

AppleCare Recommendations

Apple Hardware Test is one of several tools and procedures you can use when your Macintosh is having trouble. Here are some steps you can follow to help resolve problems. Please back up your data before performing any of these steps.

1. Turn the computer off and on.
You can often eliminate problems by selecting the "Shut Down" option from the Special menu to fully shut down the CPU, then restarting your system.

2. Check cables, peripherals, and user controls.
Shut down your computer. Then disconnect and reconnect all cables. Disconnect all peripherals (such as printers, scanners, cameras and external mass storage devices) to see if they are causing conflicts with your system. Adjust user controls on your monitors and other peripherals to see if this helps.

3. Start up using Mac OS 9 rather than Mac OS X.
If you have been using Mac OS X at the time of trouble, and Mac OS 9 is also installed on the computer, select the "System Preferences..." option from the Apple menu, and use the Startup Disk preference panel to select starting up from a Mac OS 9 System folder. Then select the "Restart" option from the Apple menu. After following the steps below to solve the problem, you may later wish to use the "Startup Disk" control panel from Mac OS 9, to reselect starting from Mac OS X.

4. Turn off system extensions.
Restart your system while holding down the Shift key until the following message appears: "Extensions disabled." Then release the key. This turns off system extensions that often cause conflicts. If this solves your problem, use the Extensions Manager to turn off extensions that may be causing the problem.

5. Rebuild the desktop.
Restart your system while holding down the Option and Command keys. Click OK when asked if you want to rebuild the desktop.

6. Start up from the system CD that shipped with your computer.
Start your system from the system CD by holding down the C key until you see the smiling Mac face. If the system works properly when started (booted) from the system CD, you can generally assume that the problem relates to the software which is installed on your computer.

7. Start up from the Apple Hardware Test CD, and run the Quick and Extended Tests.
If the system does not work properly when started (booted) from a known-good system CD (Step 6), you can generally assume that the problem relates to your computer's hardware components. The Apple Hardware Test CD can often be used to start up your computer even if it will not boot into the Mac OS. If Apple Hardware Test passes both the Quick Test and the Extended Test, the problem may be software related. If Apple Hardware Test detects a problem, make a note of the error code and contact Apple (Step 10).

8. Refer to Mac OS Help Center and the Internet for assistance.
The Mac OS help system under the Help menu in the Finder includes a wealth of technical information. Apple's Knowledge Base, and other resources for technical help and support are available 24 hours a day at www.apple.com/support.

9. Re-install Mac OS.
In many cases, a clean installation of the Mac OS will fix recurring problems. Back up any data before reinstalling. Please follow the instructions in your user manual or on your Restore CD to reinstall the Mac OS.

10. Contact Apple Service and Support for assistance.
If these steps don't help resolve the problem, please review the service and support material that accompanied your computer for information on how to contact AppleCare for further assistance. Apple reserves the right to change telephone hours at any time.

iDVD: Can I Make Changes to a DVD-R Disc?

This article explains how you cannot make changes to a DVD-R disc.
This article has been archived and is no longer updated by Apple.
Note: This document comes from the Mac Online Help document. It and many other helpful tips are available on your computer by choosing Mac Online Help from the Help menu.

When you are finished with your iDVD project, you can write it to a blank DVD-R disc.

Only write a disc when you are sure that you are finished with your project.

Once you write to a DVD-R disc, it cannot be overwritten. If you change anything in your iDVD project, you have to write it to a new, blank DVD-R disc.

To see motion menus and buttons in your finished discs, click the Motion button.

Click the Burn button twice. When prompted, insert a blank disc into the drive.

The time that it takes for the disc to be created depends on the amount of video on the disc and the type of computer. On average, it takes two to three minutes to encode and write one minute of video to the disc.

Published Date: Feb 20, 2012

iDVD: How to Determine TV Safe Area

This article discusses how to determine TV safe areas on iDVD.
This article has been archived and is no longer updated by Apple.
Note: This document comes from the Mac Online Help document. It and many other helpful tips are available on your computer by choosing Mac Online Help from the Help menu.

The outer edge of your DVD menus and movies may not be visible on certain television sets.

For this reason, iDVD places buttons inside this outer edge (an area known as the "TV safe area").

To see the TV safe area for your project, choose Show TV safe area from the Advanced menu. A shaded area appears on the screen. The area that is not shaded is the TV safe area.

The TV safe area varies from television to television. The TV safe area displayed in the iDVD window is only an approximation.

Published Date: Feb 20, 2012

iDVD: How to Create NTSC and PAL format DVD discs

This article explains how to Create NTSC and PAL format DVD discs.
This article has been archived and is no longer updated by Apple.
Note: This document comes from the Mac Online Help document. It and many other helpful tips are available on your computer by choosing Mac Online Help from the Help menu.

You use iDVD to create DVD discs with video that is in either NTSC or PAL format. You cannot create a disc that has both formats.

NTSC format (29.97 frames per second) is used in the United States, Canada and Japan.

PAL format (25 frames per second) is used in most European countries.

By default, iDVD is set to the correct format for your region.

To change the video format for a new iDVD project:

Choose Preferences from the iDVD application menu and select NTSC or PAL.

You cannot convert an iDVD project from one format to another. For example, if you want to make a copy of a disc you created in the United States (using NTSC video) and send it to relatives in Europe, you must export all of the movies from iMovie or Final Cut Pro in PAL format. Then you must set iDVD to PAL and create a new project.

AppleWorks 6: How to Create Charts

This article explains how to create charts.

This article has been archived and is no longer updated by Apple.

You can turn the data in a spreadsheet into a chart. Charts (also called graphs) can visually reveal trends or relationships that aren't as apparent when you view the data in rows and columns.

A chart is linked to the spreadsheet it's based on. If you change the data in the spreadsheet, the chart updates automatically.

You can create a chart using part or all of the data in a spreadsheet, and you can create various types of charts from the same data.

A chart comprises several parts:
· Title (optional): Explains the contents of the chart.
· Data series and divisions: Each set of values in a chart is a data series. In a bar chart, for example, the bars represent the data series.

Series can be broken into divisions such as intervals or categories.
· Legend (optional): Identifies what the series represent.
· Series box (optional): Used in the legend to show a sample of the color or symbol that represents each series.
· Axes: Perpendicular lines used to plot data. Tick marks and grid lines show intervals. (Pie charts don't have axes.)

You can also turn the data in a spreadsheet frame into a chart.

This document contains information from Help Center, the help system included with your computer.

AppleWorks 6: How to Set Image Resolution and Color Depth

This article explains how to set image resolution and color depth.

This article has been archived and is no longer updated by Apple.

Resolution refers to the sharpness of the images in painting documents, and is measured in dots per inch (dpi). The default resolution for a new paint document is 72 dpi.

Color depth refers to the number and range of colors displayed in the pen and fill color palettes. The maximum color depth of your monitor and video card determines the maximum color depth you can achieve.

Tip: For best results, set the image resolution and color depth before you begin painting.

To change image resolution or color depth for a painting document or frame:
Choose Resolution & Depth from the Format menu.
Select a value for resolution.

Note: Increasing the resolution decreases the painting area and the dimensions of images you see onscreen. You can compensate for the reduced painting area by increasing the length or width of your document. You can compensate for the reduced image dimensions by zooming in.

Tip: To take full advantage of your printer's capabilities, select the same resolution as your printer. If your painting document will be viewed only onscreen, leave the resolution at 72 dpi.

Select a color depth setting.
Note: More colors require more memory. You can increase the memory available to AppleWorks if necessary.

This document contains information from Help Center, the help system included with your computer.

AppleWorks 6: About Spreadsheets

This article explains about spreadsheets.

This article has been archived and is no longer updated by Apple.

A spreadsheet document or frame is a grid of rows, designated by numbers, and columns, designated by letters. The intersection of a row and a column is called a cell. Each cell has a unique address which consists of the column letter and the row number, for example, D3.

Note: Spreadsheet documents and frames are especially suited to working with calculations that involve numbers, dates, or times and for data that you want to sort. You can also use an AppleWorks chart (graph) to plot data in a spreadsheet. If you simply want to align text into rows and columns, use a table frame.

Row heading
Active cell address
Column heading
Active cell
Entry bar

You enter data in cells using the entry bar. You can enter text, numbers, or formulas into cells.

A block of adjacent cells is called a cell range. You identify a cell range by the addresses of the upper-left and lower-right cells in the block, for example, B2..D3.

If you don't see all the cells in your spreadsheet:
You might have a print range specified and Page View turned on. To see all the cells, turn Page View off by choosing Page View from the Window menu (only if it's already marked with a checkmark).

Note: Spreadsheet frames are created 50 rows by 20 columns in size. When working with a spreadsheet frame, you see only part of the available work area. You can open the frame as a separate window to make more room, or shift the content view (origin) to make specific cells visible.

This document contains information from Help Center, the help system included with your computer.

AppleWorks 6: How to Format Text and Numbers in Spreadsheet Cells

This article explains how to format text and numbers in spreadsheet cells.

This article has been archived and is no longer updated by Apple.

Specifying a default font and font size

You can specify a default font and font size for data in a spreadsheet document or frame. Specifying a default affects the formatting of existing cells.

To set default font characteristics:
Choose Default Font from the Options menu.
Specify a font and font size.

Formatting text and numbers in cells

To change the appearance of text and numbers in cells:
Select the cells you want to change.
Choose Font, Size, Style, or Text Color from the Format menu, then make your choice from the submenu.

Making overflow text appear within a cell

When a cell's contents are longer than the cell width can accommodate, the overflow text appears in the next cell to the right (if that cell is empty) or is hidden (if that cell contains data). To have AppleWorks wrap the overflow text to another line, turn on word wrap.

To turn on word wrap:
Select the cells in which you want text to wrap.
Choose Alignment from the Format menu, then choose Wrap from the submenu.

Note: A long entry might wrap below the border of the cell. To view the entire entry, resize the row.

Specifying formats for numbers, dates, or times

To specify formats for numbers, dates, or times:
Select the cells you want to format.
Choose Number from the Format menu.

Tip: For a single cell, double-click the cell.

Click Number, Date, or Time, then choose a format from the pop-up menu. For an explanation of the number formats, see the table below.
Note: The way AppleWorks displays dates and times is also determined by settings in the Date & Time control panel (in the Apple menu).

If you selected a number format, choose any additional options you want:
·To use separators in numbers greater than 999, click Show Separators for Thousands.
·To show negative numbers in parentheses rather than with a minus sign, click Show Negatives in Parentheses.
·To change the decimal precision (the number of digits that appear to the right of a decimal separator), type a new value. (The precision setting has no effect on numbers displayed in the General format.)
Note: The precision you specify affects only how many decimal digits are displayed. AppleWorks can display as many as 11 significant digits.

Note: If a number is too long to fit in a cell, AppleWorks first attempts to display it in scientific notation. If it still won't fit, AppleWorks displays a string of number signs (#). AppleWorks also displays number signs if a date or time is too long to fit in a cell. To see the data, resize the column.

The following table explains the numeric formats and shows how the number 43.666600 is displayed in each format, assuming a precision setting of 2.

Numeric format Description
General (43.6666) Displays up to 11 digits of the number as typed. Drops trailing zeros to the right of the decimal point and rounds numbers with more than 11 digits. Numbers with more than 11 digits to the left of the decimal point are displayed in scientific format.

Currency ($43.67) Inserts the currency symbol specified in the Numbers control panel (in the Apple menu).

Percent (4366.66%) Multiplies the number by 100 and inserts the percent symbol. (The number 5 is displayed as 500%, and the number .05 as 5%.)

Scientific (4.36e+1) Displays numbers as an exponential power of ten. (The number 1,000,000 is displayed as 1.00e+6, or 1.00 multiplied by 10 to the sixth power.)

Fixed (43.67) Rounds numeric entries to a fixed number of decimal points.

This document contains information from Help Center, the help system included with your computer.

Published Date: Feb 20, 2012

AppleWorks 6: Types of Spreadsheet Data

This article describes the types of spreadsheet data.
This article has been archived and is no longer updated by Apple.
You can enter numbers (including dates and times), text, or formulas into spreadsheet cells. You can enter up to 255 characters in a cell.

The numbers 0 through 9. To enter a negative number, type a minus sign (hyphen) before the number. AppleWorks displays and stores a maximum of 11 significant digits. You can sort numeric data and use it to perform calculations or produce charts.

Tip: To enter numbers with leading zeros, type an equal sign (=) and quotes around the number, for example, ="001".

Date and time Dates and times entered as numbers (for example, 8/12/00, 17:20, or 5:20 PM). You can sort dates and times and use them to perform calculations or produce charts.

Text All letters, numbers, and symbols.
If you enter letters or symbols with numbers into a cell, AppleWorks treats the cell contents as text.

Formula A set of instructions for calculating a value in a spreadsheet cell. You enter the formula in the entry bar, and the result appears in the spreadsheet cell.

This document contains information from Help Center, the help system included with your computer.

Published Date: Feb 20, 2012

AppleWorks 6: How to Move or Copy Spreadsheet Data

This article explains how to move or copy spreadsheet data.

This article has been archived and is no longer updated by Apple.

You can move data, or a copy of it, to another location. When you use the Cut or Copy command, the selected data is placed in a holding area called the Clipboard, where the text remains until you choose Cut or Copy again or you turn off your computer. The Clipboard holds the contents of only one Cut or Copy operation at a time.

When you use the Move command, you bypass the Clipboard.

Note: With cells that contain cell references, cutting or copying and then pasting cells has a different result from moving them with the Move command.

Moving or copying data via the Clipboard

To move or copy data and formulas from one location to another:
Select the cells.
Choose Cut or Copy from the Edit menu.

· Choose Cut if you want to move the selected cells.
· Choose Copy if you want to leave the selected cells in place.

Select the cell where you want to move the data. (For a range of cells, select the upper-left cell of the new location.)

Choose Paste from the Edit menu.
When you paste cells that contain relative cell references, AppleWorks updates the references.

Note: To paste the value of a cell but not the formula it contains, choose Paste Special from the Edit menu. Select Paste Values Only, then click OK.

Tip: To move selected cells quickly without using the Clipboard, drag the cells to a new location. To copy selected cells, press Option while you drag.

Moving data without using the Clipboard

To move data and formulas without using the Clipboard:
Select the cells.
Choose Move from the Calculate menu.
Type the cell address of the cell where you want to move the data. (For a range of cells, type the address of the upper-left cell of the new location.)

Tip: To quickly fill adjacent cells with the same data, or a series or pattern of data, use one of the fill commands (in the Calculate menu).

This document contains information from Help Center, the help system included with your computer.

Published Date: Feb 20, 2012

AppleWorks 6: How to Set Spreadsheet Display Options

This article explains how to set spreadsheet display options.

This article has been archived and is no longer updated by Apple.

To set spreadsheet display options:
Choose Display from the Options menu.
Select options:

· Cell Grid displays dotted lines between columns and rows.
If you want the grid lines to be solid, also select Solid Lines.
· Formulas displays formulas in cells that have them, rather than the results.
· Column Headings and Row Headings display the letter and number labels for columns and rows.
· Mark Circular Refs displays heavy dots before and after the content of any cell containing a circular reference (when formulas in two or more cells refer to each other or a cell refers to itself).AppleWorks also displays the following display options for spreadsheet frames:
· Origin specifies which cell appears in the upper-left corner of the frame.
· Name specifies the name of the spreadsheet frame. You name a spreadsheet frame when you want to reference cells in it in another spreadsheet frame or document.

Note: Changes you make to the Cell Grid, Column Headings, and Row Headings options in the Display dialog box affect the settings for the similar printing options in the Print dialog box. But you can change the printing option settings without affecting your display options.

This document contains information from Help Center, the help system included with your computer.

Published Date: Feb 20, 2012

AppleWorks 6: How to Enter Spreadsheet Formulas and Functions

This article explains how to enter spreadsheet formulas and functions.

This article has been archived and is no longer updated by Apple.

Entering a simple arithmetic formula

To enter a simple arithmetic formula:
Select the cell that will contain the formula.
Type an equal sign (=).
Type the numbers and arithmetic operators needed for your calculation. For example:

· =3+4 returns a value of 7
· =22-8 returns a value of 14
· =8*5 returns a value of 40
· =72/6 returns a value of 12For complex calculations, use parentheses to indicate the order in which subcalculations should be performed.

Confirm your entry.

Including a function in a formula

To enter a function in a formula:
Click in the entry bar where you want to insert a function.
Choose Insert Function from the Edit menu, or click the Function button, to the left of the entry bar.
Select a function, then click Insert.
Replace the argument names with values, cell references, or references to named cells or cell ranges.
Confirm your entry.

If AppleWorks displays a message telling you that the formula is incorrect:
Make sure you've deleted any ellipses (...), which indicate optional additional function arguments.

If you see heavy dots on either side of a cell value:
AppleWorks is indicating that the cell contains a circular reference (when formulas in two or more cells refer to each other or a cell refers to itself).
Either correct the circular reference or turn off the Mark Circular References display option.

Controlling when AppleWorks performs calculations

When you enter a formula in a spreadsheet cell, AppleWorks calculates the result. As you work, calculated values are automatically updated whenever you make a change that affects the formula result.

In large or complex spreadsheets, you can speed up your work by turning off this automatic calculation feature.

To turn off automatic calculation:
· Make sure Auto-Calculate is deselected in the Calculate menu.

To calculate values when automatic calculation is turned off:
· Choose Calculate Now from the Calculate menu.

This document contains information from Help Center, the help system included with your computer.

Published Date: Feb 20, 2012

AppleWorks 6: How to Enter Spreadsheet Data

This article explains how to enter spreadsheet data.

This article has been archived and is no longer updated by Apple.

To enter data in a cell:
Click the cell.
Type the data or formula.

As you type, the data appears in the entry bar, just below the document window title bar. The data scrolls to the left if you type more than can fit in the entry bar.

IMPORTANT: To avoid confusion when entering dates, always use 4-digit years. In order for AppleWorks to interpret 4-digit years properly, click "Show century" in the Date Formats dialog box of the Date & Time control panel (in the Apple menu).

Confirm your entry with one of the following methods:

Press the Enter key. (The next cell selected depends on your spreadsheet preferences.)
To remain in the same cell, click the Accept button, to the left of the entry bar.

· To move to the cell below, press Return.
· To move to the cell to the right, press Tab.
· To move to the cell above, press Shift-Return.
· To move to the cell to the left, press Shift-Tab.

Tip: Depending on your spreadsheet preferences, you can also use the arrow keys to move to other cells.To cancel what you typed and restore the previous contents of the cell, click the Cancel button, to the left of the entry bar, before confirming your entry.
Or press the Esc (Escape) key.

Tip: If you select a cell range, you can press Tab, Return, or any of the arrow keys to move just within the selected cells.

If you can't edit a cell:
The cell might be locked. Unlock the cell to edit it.

If the text data in a cell is truncated:
The cell width is too narrow to accommodate it. Either resize the column or turn on word wrap.

If you see number signs (#) in a cell:
The cell width is too narrow to accommodate the number, date, or time in it. Resize the column to see all the data.

If numeric data is displayed in scientific notation:
Either the cell width is too narrow to accommodate the data in it (resize the column) or the number is too large for AppleWorks to display in any other format (AppleWorks displays a maximum of 11 digits in cells).

This document contains information from Help Center, the help system included with your computer.

AppleShare IP Third Party AFP Client Products

This article provides information about software and hardware products that work with AppleShare IP to provide enhanced or additional capabilities.
This article has been archived and is no longer updated by Apple.

AFP Clients

AFP Engage! URL Processor works with Web browsers, email readers and most other Internet applications to enable those applications to process AFP (AppleShare) URLs. With the AFP Engage! URL Processor, you can publish URLs to your AppleShare server on Web pages and send them in email messages. Works with URLs over both IP and AppleTalk.
Open Door Networks, Inc.

MountIP is an OSAX (AppleScript extension) that adds a new command to the AppleScript language, enabling users to write scripts that can mount AppleShare IP-based servers. It supports both anonymous as well as authenticated logins via the standard afp URL syntax. MountIP is FREEWARE, so use it and enjoy.

PC MACLAN Pro for Windows 95 is the only software suite to combine IP (Internet Protocol), LAN and remote access technology into one package for file and printer sharing between PCs and Macs. This powerful networking suite is the ideal cross-platform integration tool for applications in pre-press, content development, education and other Apple-dominated markets. Miramar's IP (Internet Protocol) Client technology lets users expand their networking capabilities by accessing any AppleShare IP server, whether located locally, at a branch office on the company WAN, or across the globe over the internet. Miramar Systems.

Unmounter is a shareware application that automatically unmounts unused shared disks and allows the user to remount them easily from the desktop. Unmounter is especially useful in remote access and dial-on-demand environments, where phone and ISDN lines stay open while AFP sessions are active. DouWere.

Vicomsoft SurfDoubler allows two computers to share Internet access via one connection device (including modem/cable modem/ISDN/ADSL) and one ISP account at the same time. An Automatic Set-up Wizard makes configuration simple for even the non-technical! More information and a free evaluation copy can be found at the Vicomsoft web site.Vicomsoft

Web Engage! enables the Web and FTP components of your AppleShare IP server to be easily found and accessed using the Chooser. The Web Engage! plug-in registers these services on AppleTalk, and the Web Engage! and FTP Engage! Chooser extensions let you browse for these services by zone and initiate access to the services through the Chooser--just the way you'd expect on a Macintosh! Open Door Networks, Inc.

AppleShare IP Third Party Publishing and Web Site Creation Products

This article provides information about software and hardware products that work with AppleShare IP to provide enhanced or additional capabilities.
This article has been archived and is no longer updated by Apple.
Publishing and Web Site Creation

ChoosePage is a plug-in that allows you to put a pop-up dialog on a web page. When someone clicks the submit button, they are redirected to the location specified in the pop-up. An example of this technology in use is at the bottom of the pages on the ClearInk website. Clear Ink

DynaMorph is a cross platform server side scripting engine and integrated database that enables web site developers to easily construct and maintain large or dynamic web sites. DynaMorph supports the following platforms and web servers: Macintosh, UNIX, and Windows NT/96. DynaMorph's intelligent document caching system provides peak performance and keeps your site up-to-date as you make changes. Morph Technologies, Inc.

NetCloak, the 1996 winner of MacUser Magazine's "Eddy" award for "Best New Internet Server Application," gives you dozens of HTML extension commands that make it easy to build dynamic, compelling Web pages. Add dynamic information like date and time to your pages, as well as headers, footers, counters, and more. All with no programming required! Visit the Maxum Development Web site for more information and a free demo copy. Maxum Development Corporation

NetForms makes it easy to create interactive Web sites. NetForms makes your users an active part of your Web site, but keeps you in complete control. With NetForms on your Web server, you can turn data from HTML forms into text files, e-mail messages, even new Web pages. Create mailing list maintenance pages, guestbooks, surveys and online discussion forums with no programming required! Visit the Maxum Development Web site for more information and a free demo copy. control.Maxum Development Corporation

PICT FM is the first web server picture add-on product for FileMakerÂ® Pro for Macintosh. PICT FM enables on-the-fly PICT to JPEG conversion of graphic images stored or referenced in FileMaker Pro container fields. Web Broadcasting

SiteCam adds a full-featured webcam to your Macintosh! Stream live video and/or automatically captures JPEG, PICT, GIF images and QuickTime movies. Visit Rearden Technology to see it in action and purchase it on-line.
Rearden Technology

SMTPMailIT is an AppleScriptable, lean, mean, multi-threaded, asynchronous, fat, Open Transport aware SMTP Mail sending application. It's a great solution for Web servers, monitoring applications, debugging, 'back-ending' and more. Hi Resolution.

WEB FM enables FileMaker Pro developers to quickly and easily build wicked fast, truly dynamic and interactive online database applications for the World Wide Web or a corporate Intranet. The feature list mirrors that of FileMaker Pro with support for relational and portal fields; browsing, sorting, creating and editing database records; even running ScriptMaker scripts. AppleShare IP 6.3.3 Features

This article describes the latest features of AppleShare Ip 6.3.3

This article has been archived and is no longer updated by Apple.

Powerful file transfer capabilities
Share files between Macs and Windows clients
Provide files services for up to 500 simultaneous users
Transfer files extremely fast over TCP/IP
Index server volumes with Sherlock
Automatically create personal home folders
Provide FTP services

Efficient remote administration
Manage AppleShare servers from anywhere
Administer multiple servers at once
Use the Mac OS Admin application from a Macintosh workstation or use any web browser to control your server

Ready-to-use web server
Host up to 50 unique web sites
Index sites with the Sherlock web server plug-in
Search hosted sites from any type of client
Serve nearly 50 million hits per day
Use HTTP as another method to share files
Extend services with a wide array of third-party plug-ins

Easy Access
Use Mac OS 9 clients to browse for File, FTP, and Web services over TCP/IP
Access the file and printer server through the Chooser
Define URLs to provide simple pointers to AppleShare services
Access services from Windows clients using their Network Neighborhood
Automate access from Mac OS clients using the Keychain

Flexible print services
Distribute print jobs across up to 10 printers
Host up to 10 print queues
Print over TCP/IP and AppleTalk
Print from Mac, Windows and AppleTalk clients
Control access to printers with a password

Versatile e-mail support
Provide standard POP and IMAP mail services
Support more than a thousand mail clients per server
Support up to 10,000 users with multiple servers
Manage all user mail from any IMAP client
Send e-mail using built-in group mailing lists and forwarding
Protect mail clients from spam

Users and Groups support
Centrally administer user information on one server
Share users and groups between multiple AppleShare IP servers
Create up to 10,000 unique users in the user database
Apply access privileges across all key services
Simplify access assignments using group memberships

Security
Control access to materials with user's name and password
Password protect entire web sites
Use built-in firewall to further limit risk
Restrict e-mail traffic with a definable mail host list
Disable accounts after multiple failed login attempts

How to connect and disconnect FireWire devices

Learn how to connect and disconnect FireWire devices.

This article has been archived and is no longer updated by Apple.

You can connect as many as 63 FireWire devices (including computers) together. There are multiple ways to connect FireWire devices to your computer:

- For up to 16 devices, use a chain to connect devices together.
- For 17 or more devices, set up the devices in a hierarchy, or tree arrangement.

You can also use a FireWire hub to connect multiple FireWire devices to your computer.

Connecting a FireWire device

If the device came with software, install this software on your computer.
For more information, see the documentation that came with the device or contact the device manufacturer.

If necessary, connect the FireWire device to a power source.

If your FireWire device does not have an attached FireWire cable, connect one end of a FireWire cable to the FireWire port on the device.

Connect the other end of the cable to the FireWire port on your computer.
6-pin FireWire port and connector

Tip: Some FireWire cables use latching connectors you must pinch when unplugging the connector. If a latching connector does not fit into a port, replace that cable with one that doesn't have a latching connector.

Turn on the device. For more information, see the documentation that came with the device.

You should now be able to use the FireWire device with your computer.

Many devices have a power-on indicator light which lights up to show that the device is properly connected and receiving power.

Disconnecting a FireWire device

Important: Don't disconnect a FireWire device while the device is being used by an application or you may damage the files on it and other FireWire devices.

To disconnect FireWire devices from your computer and from each other:

1. If you're using files and applications on a FireWire device, save and close the files, then quit all open applications. If you don't do this before you disconnect the device, you may damage the files on that device.
2. Drag the device's icon to the Trash. If you don't do this before you disconnect the device, you may damage the files on that device.
3. Unplug the connector from the FireWire port. Pull the connector, not the cable.

This document contains information from the Mac OS 9 Help Center.

Types of USB Hubs

This article has been archived and is no longer updated by Apple.

A USB hub is a device that can have other USB devices plugged into it. You use a USB hub when you want to connect more devices to your computer simultaneously and when you want to increase the distance between the devices and the computer. You can extend the number of available USB ports by plugging hubs together to form a large hierarchy of USB devices. You can also use a USB hub to extend the distance of an attached device.

There are two types of USB hubs: self-powered and bus-powered.

Self-powered hubs

A self-powered hub has an AC adapter that provides external power to the hub. Your computer is a self-powered hub. To use the hub, you need to plug the adapter cord into an electrical outlet or power strip. The hub supplies its own power, so you can connect most USB devices to it. Typical self-powered hubs have four or seven USB ports.

Note: Apple recommends that you use self-powered hubs instead of bus-powered hubs for best performance.

Bus-powered hubs

A bus-powered hub receives power from the computer or from another self-powered hub, so you don't need to plug it into an AC outlet. You can plug low-powered USB devices, such as a mouse or joystick, into a bus-powered hub. The Apple USB keyboard contains a bus-powered hub.

IMPORTANT: You cannot connect two bus-powered hubs together because there's not enough power for both hubs or devices attached to them. To connect two hubs together, at least one hub must be self-powered. For this reason, you cannot connect an Apple USB keyboard to the USB port on another Apple USB keyboard. If you want to use two bus-powered hubs with your computer, connect each to a USB port on the computer or to a self-powered hub. If you use three or more hubs connected to one another, set them up so the chain alternates between the two kinds.

Troubleshooting portables that won‘t turn on or start up

Learn how to troubleshoot a PowerBook G4, iBook, or iBook G4 that won't turn on or start up.

This article has been archived and is no longer updated by Apple.

1. Unplug the power adapter from the electrical outlet. Plug it back in. Make sure the electrical outlet is working by plugging in another device (such as a lamp).

2. Unplug the power adapter from the computer, then plug it back in.

3. Make sure you are using the adapter that was designed for your computer. If you aren't sure or if you need a new adapter, learn which adapter is appropriate for your computer.

4. Your computer's battery may need to be recharged. Press the small button on the battery. You should see one to four lights indicating the battery's level of charge. If you see just one light blinking, the battery needs to be recharged.

5. Disconnect any devices connected to the computer including printers, hubs, third-party keyboards, or mice.

6. Press the control key, the command key, and the power button simultaneously. If this has any effect, the computer will start up.

7. Reset the PRAM.

8. Reset the Power Manager. When you do this, you may need to reset the date and time in Date & Time preferences (Mac OS X) or the Date & Time control panel (Mac OS 9).

9. If you recently installed additional memory, make sure it is correctly installed and is compatible with your computer.

10. Remove the new memory to see if the computer starts up properly.

11. If you are still unable to start up your computer after trying each of these steps, you may need to take the computer to an Apple Authorized Service Provider for more assistance.

WebObjects 5.2: How to Access the WOStats Page

This document describes how to Access the WOStats Page.
This article has been archived and is no longer updated by Apple.
For each instance of your application, there is a statistics (WOStats) page that displays information such as the application's running time and memory usage. Before accessing the WOStats page, though, you have to set a password.

There are three ways to set the password:

1. Use the command line.
Set the password by using the command line argument:

```
-WOStatisticsPassword password
```

2. Use Project Builder.
Add the WOStatisticsPassword to the list of Launch Arguments before opening and running your application.

3. Use JavaMonitor.
The password can be set from the JavaMonitor tool.

    1. Click the Applications tab.

    2. Click Config.
    The instance Settings page appears.

    3. Add `-WOStatisticsPassword password` to Additional Arguments.

Before viewing the instance statistics (WOStats) page, you have to type the password. However, the user name can be left alone.

After setting a password, you can access the instance statistics (WOStats) page of an instance through JavaMonitor, or directly through a Web browser.

Using JavaMonitor to View WOStats

1. Open the Application detail page.

2. Click WOStats for the instance statistics you want to view.

Using a Web Browser to View WOStats

1. Open a Web browser.

2. Enter the WOStats address:

http://myhost/cgi-bin/WebObjects/MyApp.woa/wa/WOStats

Note: if there are multiple instances, you must also specify the instance number.

http://myhost/cgi-bin/WebObjects/MyApp.woa/1/wa/WOStats

Macintosh: Korean-Language Word Processors

Do you know of a Korean-language word processor?
This article has been archived and is no longer updated by Apple.
The Apple distributor in Korea, Elex Computer, has developed the HangulTalk 6.0.2 with Apple Far East. It has full Korean-language support and Hangul PostScript printing.

For word processing, Elex Computer has worked with Paragon Concepts to localize the Nisus word processor. The Korean version has full script-manager support plus in-line Hangul input. Besides Nisus, a Korean version of Quark XPress is also available.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

Naming files and folders on your iDisk

You can usually name files on your iDisk whatever you want, but there are a few exceptions.

This article has been archived and is no longer updated by Apple.

.Mac explains how to name files you share on file sharing webpages you make with HomePage. The same rules apply to files you save on your iDisk.

One very important tip you shouldn't overlook is to only use a period (.) to separate a filename extension from the rest of the name. Don't begin a filename with a period. In many UNIX-style operating systems, a file whose name begins with a period is "hidden". Although the file may be visible on your desktop in Mac OS 9, it will become invisible or hidden once you copy it to your iDisk. Since the file is actually on the disk, it will take up a portion of your allotted space.

Example

- Valid filename: image.jpg (note the period within the filename, but not at the beginning)
- Invalid filename: .image.jpg (note the period at the beginning of the filename)

Mac OS: File Type and Creator Codes, and File Formats

Files stored by Mac OS 9 and earlier contain 4-character file type and creator codes, which are used by the Finder and applications. This article describes Mac OS file type and creator codes, and includes a short section on the concept of file formats.

This article has been archived and is no longer updated by Apple.
The native file system used by Mac OS 9 and earlier includes a provision for each file to contain a file type and creator code. FIle types and creator codes are 4-character text strings embedded within the file along with other information about the file (for example, the file's name, its creation and modification dates, and so forth). Through the use of type and creator codes, the Finder can determine which application(s) can open a particular file.

File Type Codes

The desktop database keeps track of the file type of every file. Here are examples of some common 4-character file type codes, followed by descriptions:

- CWWP (AppleWorks word processing)
- MooV (QuickTime movie)
- TEXT (plain text file)
- PICT (picture file)
- GIFf (GIF image)

When you open a file from within an application, the application looks at each file's 4-character file type code to see if it can be opened. Some applications can open a variety of file types.

Creator Codes

The desktop database also keeps track of the creators of files. As you might guess, this is a 4-character code that identifies which program actually created the file. Here are examples of some common 4-character creator codes, followed by descriptions:

- BOBO (AppleWorks)
- TVOD (QuickTime)
- ttxt (SimpleText)
- Hway (iMovie)

For example, a text file saved with SimpleText has a file type of TEXT and a creator of ttxt.

You can find out the type and creator of a file using a utility such as ResEdit, or by dragging a file onto the Custom Search Options window in Sherlock, or through the use of an AppleScript application/droplet.

File Formats

A file format is a set of rules and instructions that are used to read and write files. Some file formats are publicly known, while others are proprietary. Examples of publicly known file formats:

- text
- Rich Text Format (RTF)
- binhex

Examples of proprietary file formats:

- AppleWorks word processing document
- FileMaker database

When an application reads in a file it expects certain information, in a certain order. Usually there is a header, where global information about the particular file is kept. Then there might be a database of objects if it is a drawing program, or some text if it is a word processor.

File formats used by various applications are never needed by the ordinary user, but may be needed by developers who are writing translators or other utilities.

Information on Double-byte Script Systems (Japanese and Chinese Language Kits) and Claris Applications

Double-byte script (Japanese and Chinese Language Kits for Macintosh system software) information and incompatibility with Claris applications.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The Japanese and Chinese Language Kits are packages that add double-byte script capabilities to any System 7.1 Macintosh System. The core of the package is fonts, an input method, script resources and WorldScript II. Some extensions and a utility add additional functionality. An installer script and user documentation complete the package. The following information uses the Japanese Language Kit as an example, because Claris currently sells the most 2-byte-compatible products for Japan. The Chinese Language Kit is different in that it contains two different kits, one for Traditional (Taiwan and Hong Kong) Chinese and one for Simplified (Mainland China) Chinese. The way they work is the same. Also, more than one Language Kit may be installed at a time, as long as the Japanese Language Kit is installed before the Chinese Language Kit in a fresh System 7.1.

The Japanese Language Kit contains the system extensions and fonts necessary to support Japanese text on any localized 7.1 System (eg. English, French, Korean). The Japanese Language Kit will be available outside the US and is being tested with most of Apple's localized non-Roman system software. This product requires System 7.1 - any localized version. If you have already installed earlier script system resources, please remove them because they may

confuse the installer. The Language Kit extension enables compatibility with applications that have menus and dialogs not compatible with the current Primary script. For example, on the US System, this means that even though the primary script is Roman (Dialog boxes and the Finder all display text in Chicago font), if you launch a Japanese localized application, the 'primary' script changes to Japanese automatically on the fly, and the menus and dialogs that appear while that application is the frontmost application will display in Osaka font, the Japanese system font. If you switch back to the Finder, all of its menus and dialogs are still displayed in Chicago, because the real primary script is Roman for the System and Finder. The effect is like having two different 'primary scripts, each activated depending on the application currently running.

Claris applications not localized for Japan will run on the Japanese Language Kit, but will not gain any Japanese functionality. They will only be able to handle single-byte Roman characters, just as if they were running on a normal System with no Language Kit installed. An exception to this rule is Claris Impact, which has nominal Japanese character compatibility, but cannot perform all of the required line-breaking and formatting features normally included in a

Japanese localized version. For complete Japanese text functionality, you must use the localized Japanese version of the products.

Here is a an update of the localized versions for Japan currently on sale:
MacPaint-J 2.0
MacProject II-J 2.1v3
MacDraw II-J 1.1v2
MacDraw Pro-J 1.5v1
MacWrite II-J 1.5v2
FileMaker Pro-J 1.0v5 Mac
ClarisWorks-J 1.0v4 Mac

For Traditional Chinese:
FileMaker Pro-TA 1.0v1 Mac
ClarisWorks-TA 1.0v1 Mac

For Simplified Chinese:
ClarisWorks-CH 1.0v1 Mac

For Korea:
ClarisWorks-KH 1.0v3

FileMaker Pro Note: The double-byte (Chinese and Japanese) localization of FileMaker Pro are version 1.0-based. They include changes to the file format for extra index settings, and are therefore NOT compatible with FileMaker Pro U.S. However, FileMaker Pro 1.0 US files can be imported directly into FileMaker Pro-J and irreversibly converted. The reverse is not possible. Note also that there are no Windows products available for double-byte markets.

Mac OS: Troubleshooting Out of Memory Errors

How can I resolve out of memory errors?
This article has been archived and is no longer updated by Apple.
An " Out of Memory" or" Not Enough Memory to Perform Operation" while you are working in an application, doesn't mean you don't have enough computer memory. When you launch a Macintosh application, it requests the amount of memory set in it's Get Info window. There may be times when you are working with a very large data file and there is not enough memory allocated to the application to work properly.

To increase an application's memory allocation:

1. Quit the Application and return to the Finder.

2. Go to the actual application program icon (not a document created in the application or an alias to the application) and click once to select it.

3. From the File menu, select Get Info.

4. In the Get Info window, again verify that Application is listed after Kind:

5. Increase the memory in the Application Memory Size box at the bottom of the Get Info window. If you are using System 7.0, increase the Current Size. If you are using System 7.1 or greater, increase the Preferred Size. Later versions of the Mac OS have a pop up menu in the Get Info box where you select Memory. Increasing memory by 500K to 1000K should be enough in most cases.

If the program still will not open, try restarting the computer. Additional memory may be the only option of the application or file you are trying to open is fairly large. You can try using virtual memory as a temporary workaround. If you find that to solve the problem, additional memory should be installed.

ClarisWorks: Transfer (Import) Data from FileMaker Pro for Mail Merge

A step-by-step guide to exporting your FileMaker Pro data to a ClarisWorks database for a mail merge

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Knowledge Base.
This article has been archived and is no longer updated by Apple.
ClarisWorks 4 and ClarisWorks 5 include an AppleScript application, called Mail Merge, located in the ClarisWorks Scripts folder. Mail Merge automates moving names from a FileMaker database into ClarisWorks for merging into form letters.

ClarisWorks 4 Mail Merge applescript works with FileMaker Pro version 2. ClarisWorks 5 Mail Merge AppleScript works with FileMaker Pro 3 and 4.

Below are ClarisWorks versions 1 - 3 instructions for manually moving data from a FileMaker Pro database to a ClarisWorks database. Once moved, the data, such as names and addresses, can be used in a Mail Merge to print form letters.

Instructions:
A. Export from FileMaker Pro.

1. With your FileMaker Pro database on the screen, select Export from the File menu. Select "DIF" as the file type from the pop up menu.
2. Enter a file name. It may be helpful to place the suffix .DIF after the name. (For example: MyNames.DIF)
3. If you are using System 7 (or later), click the Desktop button. Click on "OK".
4. Quit FileMaker Pro

B. Convert the data to ClarisWorks.

1. Launch ClarisWorks. Since you do not need a new document here, click Cancel.
2. Choose Open from the File menu.
   - If you are using ClarisWorks 1.0, click on the Import Options flag and select database. With all other versions of ClarisWorks, select Database in the Document Type pop-down menu.
   - If using System 7, click the Desktop button. If not, navigate through your hard disk until you find the DIF file you just created.
3. Double-click on the file or select Open. The DIF file will be converted to a ClarisWorks database in a standard list style format. (The layout structures are not retained.)

C. Setting up the Mail Merge.
Complete instructions for mail merge can be found in the onscreen help. Here's a summary of the steps.

1. Open your ClarisWorks word processing (or other) document.
2. Click within your document where you want the merged data to begin and choose Mail Merge from the File menu.
3. After selecting the name of the open database, you are presented with the Mail Merge window. You can alternate between inserting fields and typing into your document. Figure 1 shows a sample form letter with the Mail Merge palette window.
4. When you're done, press the Print Merge button to print a copy of each record currently visible in the database merged into your current document.

When printing, ClarisWorks will remove lines that are completely blank and slide the rest of your data upwards. Although merged data will be visible only on the printout, use of a third-party utility like ClickBook, Print Previewer, etc., or a Hewlett-Packard Printer will allow you to preview the print image on the screen.

Figure 1, Mail Merge window.

ClarisWorks: Using Shortcuts

Create the shortest "distance" between two tasks with ClarisWorks Shortcuts.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Many tasks we perform daily with our computers are often simple ones, but they can also be redundant. Think carefully for a moment about what it is you do with ClarisWorks every time you use the program. The odds are, some of the tasks you perform are repetitious -- out of necessity or out of well-established habit.

While there is nothing wrong with any of this, a little-used ClarisWorks feature, Shortcuts, can help save you time when performing redundant although necessary tasks. This includes such things as changing margins, changing page orientation (for printing letters versus envelopes), changing settings in Page Setup, signing your name at the end of letters, and so on.

ClarisWorks Shortcuts

ClarisWorks Shortcuts are commands you can access by clicking on a single button. ClarisWorks comes with many "ready-made" Shortcuts you can display through the Shortcuts Palette by selecting the File menu and choosing Show Shortcuts under the Shortcuts menu. You can also customize the view in Preferences under the Edit menu.

One thing that is great about Shortcuts is that you can create your own Shortcuts and add your creations to this list. First, you create a macro. Macros are recordings you create of mouse movements and key strokes. These recordings can be played back at a key stroke or mouse click. Because the macros play back at a speed that's much faster than when performed manually, they really save you time. There is virtually no limit to the macros you can record, so you'll want to experiment with key combinations and mouse movements to get a feel for what macros and Shortcuts can do for you.

Where to Begin

If you have never used ClarisWorks Shortcuts before, it may not be obvious where and how they can help you. Having the power of ClarisWorks Shortcuts at your fingertips is like having the ability to add to the ClarisWorks functionality in any environment. But where do you start?

The easiest way to determine where and how you can use ClarisWorks Shortcuts is by keeping a daily log of your computing activities for a week or two. Unless you can readily identify areas in your work pattern where Shortcuts can help, keeping a log will let you make careful observations about what you do with ClarisWorks. After keeping this log, it will be very easy to map out activities that can become useful Shortcuts.

When I was researching this article, I started keeping my own log of ClarisWorks use for a period of two weeks. When I looked at my entries, I noticed that several of the tasks I performed routinely in ClarisWorks were perfect candidates for Shortcuts. For example, I write to people all over the world (literally!), and I find I am constantly sending the same kinds of letters to certain groups of people. In particular, I noticed I write five types of letters, with different stationery designs and letterheads. Some of the styles are very formal, others informal. I noticed I was using six different kinds of closing remarks that varied by style and statement. A phrase I used repeatedly to end one type of letter was:

"Thank you for your time and consideration of this matter. I look forward to hearing from you soon.

Sincerely yours,
Name"

Being an eleven-year Macintosh computer user who has been writing to people around the world for a long time, I assure you that I have typed the above closing statement a ridiculous number of times. Over the years, this activity has surely cost me a great deal of time. However, with ClarisWorks to help me write my letters, I now have a Shortcut for appending this ending to any letter I create.

Once you have taken a look at your usage patterns, you may discover many actions that deserve to become Shortcuts.

Creating Shortcuts

Making a shortcut in ClarisWorks is very simple.

1. First you go to the File menu and select the Shortcuts menu, then choose Record Macro... from the Shortcuts sub-menu. You can also display the Record Macro dialog by typing Shift-Command-J.
2. Name your macro and assign it a keystroke. Be careful that you don't give it a keystroke reserved by the application (such as Command-Q or Command-S). Click on the Function Key option only if you use an extended keyboard with F keys along the top. Many extended keyboards come with a plastic template that you overlay on the F keys, so that you can write yourself a note regarding what they mean.

Record your macro

When recording a macro, it's generally a good idea to think ahead of time of what it is you want it to do. Also, practicing in advance before recording your macro is a good idea as well. The reason for practice is this, recording a macro is like recording a scene in a Hollywood movie. It may require several "takes" to get things right.

For example, let's say that you record a macro which involves a paragraph of text that you have typed. What if half way through typing this block of text you make a typo but don't notice it until after you have typed a few more words? If you go back and backspace or correct the typo, the Shortcut will record this. This means that when you play it back, both the typo and the corrections you made will appear on the screen. It's a good idea to record your macro as cleanly as possible, because that's the one that plays back the fastest.

Adding Shortcut to the palette

After working with and recording your various macros, don't forget you can make a palette containing them for handy use. The options I selected for the recording of that macro are Has Shortcut and In Shortcuts Palette. I also created my own custom icon, by clicking on the gray button and making a small drawing.

Palettes are convenient because you can move them around on your screen and customize them for maximum efficiency. You can control the appearance of your palette via icons that you can design to look as good as you want. You can also display the Shortcuts Palette itself in several ways. Go to Preferences under the Edit menu to customize the view.

Arabic Language Kit: Description and Specifications

The Arabic Language Kit allows users to display, input, edit and print Arabic or Persian documents on their Mac OS computer. The software is intended for educators and students, multinational businesses, and bilingual home users.

The following article contains a description of the Arabic Language Kit and lists its hardware and software requirement specifications.
This article has been archived and is no longer updated by Apple.

Overview

Apple's Arabic Language Kit is the easiest, most affordable way to add Arabic and Persian text to your documents.

After the simple installation process, you can switch effortlessly between the computer's main language and Arabic or Persian. The kit lets you enter, edit, and print Arabic and Persian text, and mix either language with left-to-right languages in the same document, even in the same sentence. The kit comes with a selection of keyboard layouts optimized for both native speakers and students, accompanied by transparent labels for customizing your keyboard.

The Arabic Language Kit can be used with most Mac OS?compatible applications that support right-to-left text entry (including multilingual applications), or that have been localized for Arabic or Persian. The kit works with the built-in multilingual capabilities of the Mac OS, so you can copy and paste or drag and drop text between applications. And you can work with documents created by colleagues in the Arab world who use the Arabic or Persian version of the Mac OS.

The kit includes a selection of Apple TrueType fonts to ensure high-quality on-screen and printed characters at any size. These fonts incorporate exciting new typographic features based on Apple's QuickDraw GX technology. Most of the kit's fonts are also provided in PostScript versions.

The Arabic Language Kit is part of a family of Apple language solutions, which offer an affordable way to internationalize your Macintosh system. You can install as many different Apple Language Kits as you need on a single computer. Apple's other multilingual products include the Chinese Language Kit, the Chinese Dictation Kit, the Cyrillic Language Kit, the Hebrew Language Kit, the Japanese Language Kit, and others.

Technical Specifications

Usage Requirements

- A Macintosh or PowerBook computer with a 68020 or later processor and 4MB of RAM -OR-
- A Power Macintosh computer with 8MB of RAM
- An Apple SuperDrive floppy disk drive or a CD-ROM drive
- An application that has been localized for the target language or that supports right-to-left text

System Software Requirements
Macintosh System 7.1 or later (System 7.5 or later required to take advantage of QuickDraw GX features)

Included fonts
Arabic fonts

- - AlBayan (TrueType and Postscript)
- - Baghdad (TrueType and Postscript)
- - Cairo (bitmap)
- - Geeza (TrueType and Postscript)
- - Kufi (TrueType and Postscript)
- - Nadeem (TrueType and Postscript)
- - Thuluth (Postscript)

Persian fonts

- - Amir (TrueType and Postscript)
- - Ashfahan (TrueType and Postscript)
- - Kamran (TrueType and Postscript)
- - Mashad (TrueType and Postscript)
- - NadeemFarsi (TrueType and Postscript)
- - Tehran (bitmap)

Compatible applications
The Arabic Language Kit is based on Apple's WorldScript I technology, and is compatible with applications that take advantage of WorldScript I. The applications listed below are multilingual and/or Arabic-localized products that have been tested with this kit; check with the software

publisher for compatibility information on other applications.

- PageMaker ME from Adobe Systems (distributed by WinSoft S.A.)
- HyperCard from Apple Computer, Inc.
- SimpleText from Apple Computer, Inc.
- ClarisWorks Arabic from Claris Corporation
- FileMaker Arabic from Claris Corporation
- El Nashir El Sahafi from Diwan
- Nisus Writer from Nisus Software Inc.
- WinText from WinSoft S.A.
- WorldWrite from World Software Corporation

Applications that support QuickDraw GX technology and the Arabic Language Kit include:

- Ready, Set, Go! GX International from Manhattan Graphics Corp.
- LightningDraw GX from Lari Software, Inc.

Features
Versatile multilingual capabilities

- Switch between languages easily
- Combine different languages in the same document
- Install as many language kits as needed on a single Macintosh system

High-quality fonts

- Seven Arabic fonts and six Persian fonts
- Apple TrueType format for high-quality on-screen and printed characters
- Support for PostScript printers
- QuickDraw GX features for state-of-the-art typography

Note: QuickDraw GX font features require System 7.5 or later, QuickDraw GX software, and a QuickDraw GX compatible application.

Ease of use

- Simple, flexible installation process
- Informative installation and user's guide (in English and French)
- Transparent labels for different keyboard layouts
- Keyboard quick-reference card

Compatibility

- Works with System 7.1 and all subsequent versions of the Mac OS
- Compatible with any localized version of the Mac OS and with other Apple Language Kits
- Supports QuickDraw GX in System 7.5
- Runs in native mode on Power Macintosh computers

Ordering Information
Arabic Language Kit
Order No. M4454Z/A

- Five 1.4MB floppy disks and one CD-ROM containing:
- - Arabic Language Kit
- - Standard Arabic and Persian keyboard layouts
- - Transliterated QWERTY and AZERTY keyboard layouts
- - SimpleText Arabic, a basic text-processing application
- - Demonstration versions of compatible applications and utilities
- Arabic Installation and User's Guide (in English and French)
- Transparent keyboard labels with Arabic and Persian characters

Cyrillic Language Kit: Description and Specifications

The Cyrillic Language Kit allows users to display, input, edit and print documents in Bulgarian, Russian, Ukrainian, Belorussian, Macedonian, Serbian, or any other language based on the Cyrillic writing system on their Mac OS computer. The software is intended for educators and students, multinational businesses, and bilingual home users.

The following article contains a description of the Cyrillic Language Kit and lists its hardware and software requirement specifications.
This article has been archived and is no longer updated by Apple.

Overview

Apple's Cyrillic Language Kit makes it easy to create documents in any Cyrillic based language.

This affordable, easy-to-install kit lets you switch effortlessly between the computer's main language and Bulgarian, Russian, or Ukrainian. You can also work in Belorussian, Macedonian, Serbian, or any other language based on the Cyrillic writing system. Cyrillic text can be mixed with other languages that your computer supports-including right-to-left and Asian languages-in the same document. The kit comes with a selection of keyboard layouts optimized for both native speakers and students, accompanied by transparent labels for customizing your keyboard.

The Cyrillic Language Kit works with almost any Mac OS compatible application, including those that have been localized for Bulgarian, Russian, or Ukrainian. Because the kit builds on the inherent multilingual capabilities of the Mac OS, text created in one application can be copied and pasted or dragged and dropped into another application. With the kit, you can work with documents created by colleagues in Eastern Europe who use the Bulgarian, Russian, or Ukrainian version of the Mac OS. You can also display Cyrillic based World Wide Web servers.

The Cyrillic Language Kit includes a selection of Apple TrueType fonts, which ensure high-quality on-screen and printed characters at any size and feature exciting new QuickDraw GX typographic capabilities. The fonts provided in TrueType format are also supplied in PostScript versions.

This product is part of a family of Apple language solutions, which offer an affordable way to internationalize your Macintosh system. You can install as many different Apple Language Kits as you need on a single computer. Apple also offers the Arabic Language Kit, the Chinese Language Kit, the Chinese Dictation Kit, the Hebrew Language Kit, the Japanese Language Kit, and others.

Technical Specifications

Usage Requirements

- A Macintosh or PowerBook computer with a 68020 or later processor and 4MB of RAM -OR-
- A Power Macintosh computer with 8MB of RAM
- An Apple SuperDrive floppy disk drive or a CD-ROM drive
- An application that has been localized for the target language or that supports right-to-left text

System Software Requirements

- * Macintosh System 7.1 or later (System 7.5 or later required to take advantage of QuickDraw GX features)

Included fonts

- APC Courier (TrueType and Postscript)
- Bastion (TrueType and Postscript)
- Latinski (TrueType and Postscript)
- Sistemny (bitmap)
- Pryamoy Prop (bitmap)
- Pryamoy (bitmap)

Compatible Applications

The Cyrillic Language Kit can be used with almost every Macintosh application. However, the best results will be achieved with applications that have been developed specifically to support multiple languages, including:

- HyperCard from Apple Computer, Inc.
- SimpleText from Apple Computer, Inc.
- ClarisWorks from Claris Corporation
- Nisus Writer from Nisus Software Inc.
- WinText from WinSoft S.A.
- WordPerfect from Novell, Inc.
- WorldWrite from World Software Corporation

Applications that support QuickDraw GX technology and the Cyrillic Language Kit include:

- Ready, Set, Go! GX International from Manhattan Graphics Corp.
- LightningDraw GX from Lari Software, Inc.

Features

- Versatile multilingual capabilities
- Switch between languages easily
- Combine different languages in the same document
- Install as many language kits as needed on a single Macintosh system

Ease of use

- Simple, flexible installation process
- Informative installation and user's guide (in English and French)
- Transparent labels for different keyboard layouts
- Keyboard quick-reference card

High-quality fonts

- Six Cyrillic fonts
- Apple TrueType format for high-quality on-screen and printed characters
- Support for PostScript printers
- QuickDraw GX features for state-of-the-art typography

Note: QuickDraw GX font features require System 7.5 or later, QuickDraw GX software, and a QuickDraw GX compatible application.

Compatibility

- Works with System 7.1 and all subsequent versions of the Mac OS
- Compatible with any localized version of the Mac OS and with other Apple Language Kits
- Supports QuickDraw GX in System 7.5
- Runs in native mode on Power Macintosh computers

Ordering Information

Cyrillic Language Kit
Order No. M4455Z/A

- Four 1.4MB floppy disks and one CD-ROM containing:
- - Cyrillic Language Kit
- - Standard Bulgarian, Russian, and Ukrainian keyboard layouts
- - Transliterated QWERTY, AZERTY, and QWERTZ keyboard layouts
- - SimpleText Bulgarian, SimpleText Russian, and SimpleText Ukrainian, basic text-processing applications
- - Demonstration versions of compatible applications and utilities
- Cyrillic Installation and User's Guide (in English and French)
- Transparent keyboard labels with Russian, Bulgarian, and Ukrainian characters

Hebrew Language Kit: Description and Specifications

The Hebrew Language Kit allows users to display, input, edit and print Hebrew documents on their Mac OS computer. The software is intended for educators and students, multinational businesses, and bilingual home users.

The following article contains a description of the Hebrew Language Kit and lists its hardware and software requirement specifications.
This article has been archived and is no longer updated by Apple.

Overview

With Apple's Hebrew Language Kit, adding Hebrew and Yiddish text to your documents is both easy and affordable.

This easy-to-install, easy-to-use kit lets you enter, edit, and print Hebrew and Yiddish text. You can switch effortlessly between these languages and the computer's main language. Hebrew and Yiddish can be mixed with left-to-right languages in the same document-even in the same sentence. The kit features a selection of keyboard layouts optimized for both native speakers and students, along with transparent labels for customizing your keyboard.

The Hebrew Language Kit works with most Mac OS compatible applications that support right-to-left text entry, including multilingual and Hebrew-localized applications. Because the kit builds on the inherent multilingual capabilities of the Mac OS, text created in one application is transportable to another. You can copy and paste or drag and drop between applications, and work with documents created by colleagues in Israel who use the Hebrew version of the Mac OS.

The Hebrew Language Kit includes a selection of Apple TrueType fonts enhanced with exciting new QuickDraw GX typographic features. TrueType font technology ensures high-quality on-screen and printed characters at any size.

This product is part of a family of Apple language solutions, which offer an affordable way to internationalize your Macintosh system. You can install as many different Apple Language Kits as you need on a single computer. Apple's multilingual product offerings include the Arabic Language Kit, the Chinese Language Kit, the Chinese Dictation Kit, the Cyrillic Language Kit, the Japanese Language Kit, and others.

Technical Specifications

Usage Requirements

- A Macintosh or PowerBook computer with a 68020 or later processor and 4MB of RAM -OR-
- A Power Macintosh computer with 8MB of RAM
- An Apple SuperDrive floppy disk drive or a CD-ROM drive
- An application that has been localized for the target language or that supports right-to-left text

System Software Requirements

- Macintosh System 7.1 or later (System 7.5 or later required to take advantage of QuickDraw GX features)

Included fonts

- Arial (TrueType)
- Corsiva (TrueType)
- Eilat (bitmap)
- Hermon (bitmap)
- New Peninim (TrueType)
- Raanana (TrueType)

Compatible Applications

The Hebrew Language Kit is based on Apple's WorldScript I technology, and is compatible with all applications that take advantage of WorldScript I. The applications listed below are multilingual and/or Hebrew-localized products that have been tested with this kit; check with the software publisher for compatibility information on other applications.

What is POP3 and SMTP?

Explanation of POP3 (Post Office Protocol version 3) and SMTP (Simple Mail Transfer Protocol).

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

POP3 Server Description

The POP3 (Post Office Protocol version 3) server component allows e-mail messages to be stored on the server and retrieved by e-mail client software. A POP3 server performs user authentication (checking user name and password) to prevent unauthorized access to users' mail. Each user has a unique name and password. Basically, POP3 handles only incoming mail.

For more information on the POP3 specification, see RFC 1725 available on the Internet.

SMTP Server Description

The SMTP (Simple Mail Transfer Protocol) server component handles outgoing mail requests. SMTP servers do not perform any type of user authentication, so there is no way to prevent unwanted use of an SMTP server except through the implementation of firewalls. Although this means that any user can send mail through any SMTP server, it does not mean that they can retrieve e-mail or access other users' messages. This is a limitation of the SMTP specification, not of the AppleShare IP Mail Server.

For more information on the SMTP specification, see RFC 821 available on the Internet.

ClarisWorks 5.0 for Macintosh Translator List

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 5.0 for Macintosh includes translators (filters) for the following types of files:

XTND Translators:

AppleWorks
AppleWorks DB/SS
AppleWorks GS
ASCII
BMP
ClarisWorks 1.0 Text
DBF
DIF
Dyno NotePad & Acta 3.0
EPSF PFLT
GIF
HTML
JPEG
MacPaint 2.0
MacWrite 5.0
MacWrite II
MacWrite Pro 1.x
Microsoft Excel 3-4
Microsoft Word 3.0
Microsoft Word 4-5
Microsoft Word PC
Microsoft Works 1.1
Microsoft Works 2.0
Microsoft Works DB/SS
Movie
PICT
RTF
SYLK
Text
TIFF
WinWord
WordPerfect 1.0.x
WordPerfect 2.x
WordPerfectÊMacÊ3.1
WordPerfect PC 4.2
WordPerfect PC 5.0
WriteNow
WriteNow NeXT

DataViz MacLink Plus Translators:

ClarisWorks DB 4.0
ClarisWorks SS 4.0
ClarisWorks WP 4.0
Excel 4.0
Excel 5.0
MS Works DB 3.0 Mac
MS Works DB 4.0 Mac
MS Works SS 2.0,3.0 Mac
MS Works SS 4.0 Mac
MS Works WP 3.0 Mac
MS Works WP 4.0 Mac
PICT to WMF
WMF to PICT
Word 6.0 Mac-Win
WordPfct Mac 3.0,3.1,3.5

ClarisWorks 5.0 Links Ã As Easy as 1 - 2 - 3 - 4 - 5

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

1. A Powerful New Feature

The pervasive use of the Internet has changed the way that we think about information. The World Wide Web encourages us to jump from place to place and document to document in order to access just the information we need at any given time.

ClarisWorks 5.0 brings that same ability to the office software you use everyday with its powerful new Links features. Instead of working on a single document, you can create systems of multiple documents linked together, or linked to information on the Internet. Using live links, one click will bring you to another part of your document, open another ClarisWorks document and jump to a specific location, or even launch your Web browser and bring up your favorite URL. And like other ClarisWorks features, links are simple to create, yet powerful to use.

2. Easy Tools for Creating and Using Links

Because people work in different ways, ClarisWorks provides two sets of tools to create and manage your Links. The first tool is the Links Palette, displayed by choosing Show Links Palette under the Window menu. This palette brings together all links' functionality. You can create, edit and delete links, change between Bookmarks, Document Links and URL Links, organize your Bookmarks into folders, and sort your links by name or position, all in the same place. From the Links Palette you can even turn live links off temporarily while you edit a linked object.

The second tool is the Internet Button Bar, which provides a subset of the most commonly used functionality in the Links Palette. By default, the Internet Button Bar includes buttons to create Bookmarks, Document Links and URL Links, as well as a button to toggle live links on and off. And because you can customize any button bar to suit your individual needs, you can add the links buttons to the button bar you use the most.

3. Kinds of Links to Meet Your Needs

Bookmarks identify specific locations in a document. Clicking a Bookmark in the Links palette will jump directly to the specified ClarisWorks text or object. Better yet, you can use Bookmarks in conjunction with Document Links to link two objects within the same or different ClarisWorks documents. And for clarity, you can create folders in the Links Palette to group your Bookmarks.

Document Links provide three ways to connect ClarisWorks files. First, a Document link can open one ClarisWorks file from within another. Additionally, a Document link can jump directly to a Bookmark in a second file so that you can send a reader right to the relevant information. Finally, a Document link can jump to a Bookmark in the same file as the Document link. Like anchors on a Web page, Document links within a file allow directed navigation from location to location.

URL Links store the Internet address of a Web page. Clicking on a live URL Link will launch your default browser and open the specified Web page. Because the URL is stored in the Links palette, you can hide complex Web addresses behind simple graphics or text.

4. Simple Examples of Links in Action

Offices, schools and homes often store related information in different places and different forms. One example is a company's personnel department which needs to distribute policies and procedures to every employee. The centerpiece of this effort is an annual Personnel Manual, but there are also additional documents that can change throughout the year and other information stored on the corporate intranet that was not available when the handbook was completed. The four examples below show how links in ClarisWorks can help unite all of that information to be accessed through a single file.

A. Bookmarks can tag the beginning of each section of the personnel manual for ease of navigation. Before creating Bookmarks, it is useful to create folders to group your Bookmarks together. To do this, show the Links palette and choose New folder in the Special Menu. Create a folder named Corporate Policies and hit OK. Use the same steps to create a folder called Benefits.

Now you are ready to create the links themselves. First select the text you want to bookmark, in this case the heading of the section called Your Health Insurance Options. In the Links menu in the Links Palette, choose New Bookmark. Name the Bookmark (ClarisWorks suggests using the selected text 'Your Health Insurance Options' but you can change the name if you wish), choose the Benefits folder and hit OK. Repeat these steps for each section of the manual.

B. Internal Document Links provide a handy tool for creating an interactive table of contents. The first page of your personnel manual contains an index of the different sections of the document, the same sections which you bookmarked above. In the index, highlight the phrase Health Insurance. In the pop-up menu in the Links Palette, switch from Bookmarks to Document Links. Under the Links menu, in the palette, choose New Document Link. The suggested name is Health Insurance and the document is <current document>. All you need to do is choose the Your Health Insurance Options Bookmark and hit OK. Once you have done this for each section, you can jump directly from the index to the specified section.

C. External document links allow you to open other ClarisWorks documents by clicking on text or an object. Instead of duplicating information and maintaining two copies, you can access the same information from multiple locations. In the Personnel Manual example, this company

maintains a Corporate Backgrounder file that gets updated throughout the year as changes occur. To create this link, select the text Corporate Backgrounder from the index section of the Personnel Manual. Switch to the Internet button bar. Click on the New Document Link button (graphic here), hit the choose document button and navigate to the file named Corporate Backgrounder.cwk.

Hint: ClarisWorks will try to find the path to the original document. If that path is not available, place the target document (Corporate Backgrounder.cwk) in the same directory as the source document (Personnel Manual.cwk).

D. URL links extend the reach of your ClarisWorks documents to the World Wide Web. For up to the minute accuracy, the corporate phone book is stored in a database and accessed off of a Web page. Once again, the personnel manual contains only a reference to the Phone Book in the index with a picture of a telephone next to it. To create a URL link, select the telephone graphic and choose the New URL Link button (graphic here) in the Internet button bar. Type in the URL of the phonebook on your intranet and hit OK. With one click on the telephone icon, ClarisWorks will launch your default browser and bring your phone book to the screen.

5. That's ClarisWorks 5.0

This provides only a few simple examples of the powers that links add to your ClarisWorks documents. As you begin to work with links, you can build incredible connections between the different kinds of information stored around your company.

For further information about creating links, see the New Features in ClarisWorks 5.0 section of the online help. For additional examples of links, check out the many Stationery Index documents located in the ClarisWorks Stationery folder in your ClarisWorks 5.0 folder.

Applescript Commands in ClarisWorks 5.0 Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is the list of AppleScript commands in ClarisWorks Office (5.0) for Macintosh. You can see this information by dragging the ClarisWorks 5.0 application icon onto Script Editor.

Standard Suite: Common terms for most applications

class info: Get information about an object class
class info type class -- the object class about which information is requested
[Result: type class info] -- a record containing the object's properties and elements

close: Close an object
close reference -- the object to close
[saving 'savo'] -- specifies whether or not changes should be saved before closing
[saving in alias] -- the file in which to save the object
[as file type type class] -- the type of file in which to save the document
[using translator string] -- the name of the XTND translator to use to save the document

count: Return the number of elements of a particular class within an object
count reference -- the object whose elements are to be counted
each type class -- the class of the elements to be counted.
Result: integer -- the number of elements

data size: Return the size in bytes of an object
data size reference -- the object whose data size is to be returned
[as type class] -- the data type for which the size is calculated
Result: integer -- the size of the object in bytes

delete: Delete an element from an object
delete reference -- the element to delete

duplicate: Duplicate object(s)
duplicate reference -- the object(s) to duplicate
[to location reference] -- the new location for the object(s)
Result: reference -- to the duplicated object(s)

exists: Verify if an object exists
exists reference -- the object in question
Result: boolean -- true if it exists, false if not

make: Make a new element
make
new type class -- the class of the new element.
at location reference -- the location at which to insert the element
[with data anything] -- the initial data for the element
[with properties record] -- the initial values for the properties of the element
Result: reference -- to the new object(s)

move: Move object(s) to a new location
move reference -- the object(s) to move
to location reference -- the new location for the object(s)
Result: reference -- to the object(s) after they have been moved

open: Open the specified object(s)
open alias -- list of objects to open
[using translator string] -- the name of the XTND translator to use to open the file
[as document type DR/WP/SS/DB/PT/CM] -- the type of ClarisWorks document as which to open the file
[with password plain text] -- the password to use

print: Print the specified object(s)
print alias -- list of objects to print
[merge alias] -- list of database files to merge

[one copy boolean] -- print one copy without displaying the print dialog?

quit: Quit an application program
quit
[saving 'savo'] -- specifies whether to save currently open documents

save: Save a document
save document -- the document to save
[in alias] -- the file in which to save the document
[as file type type class] -- the type of file in which to save the document (e.g., PICT, TEXT, MW2D)
[using translator string] -- the name of the XTND translator to use to save the document
[stationery boolean] -- save the document as stationery?
[backup boolean] -- save a copy of the document in the new location?

Class application: An application program
Plural form:
applications
Elements:
document by numeric index, by name, as a range of elements, satisfying a test
window by numeric index, by name, as a range of elements, satisfying a test
palette by numeric index, by name, as a range of elements, satisfying a test
menu by numeric index, by name, by ID
library by numeric index, by name
slide by numeric index
Properties:
frontmost boolean [r/o] -- Is this the frontmost application?
name string [r/o] -- the name
selection selection object -- the selection visible to the user
version version [r/o] -- the version of the application
user name string [r/o] -- the name of the user to whom the application is registered
company name string [r/o] -- the name of the company to which the application is registered
registration number string [r/o] -- the registration number of this copy of the application
XTND translators a list of XTND translator [r/o] -- *** BOGUS (DataViz!) list of XTND translators available to the application
current slide slide -- the current slide being displayed in a slide show
editing styles boolean -- true if application is currently editing a style
clipboard anything [r/o] -- the clipboard
preferences application preferences -- application preferences
default document preferences document preferences -- application preferences
name string [r/o] -- the application's name

Class character: A character
Plural form:
characters
Elements:
character by numeric index, as a range of elements
text as a range of elements
Properties:
color RGB color -- the color
font text -- the name of the font of the character
size real -- the size in points of the character
writing code writing code [r/o] -- the script system and language of the character
style text style info -- the text style of the character
uniform styles text style info [r/o] -- the text styles which are uniform throughout the specified text
user style record -- the user style (and incremental attributes) defining the character's appearance
merge field boolean [r/o] -- is this characters a merge field placeholder?
merge field name string -- the name of the database field to be merged at this point in the text
merge field data string [r/o] -- the contents of the database field to be merged at this point in the text for the current record; undefined if not merging
drawing area drawing area [r/o] -- the character's drawing area (only for embedded graphics)
<Inheritance> text [r/o] -- subclass of text

Class document: an open document
Plural form:
documents
Elements:

window by numeric index, by name, as a range of elements, satisfying a test
page by numeric index, as a range of elements, satisfying a test
header
footer
pattern by numeric index
texture by numeric index
gradient by numeric index
Properties:
text body text [r/o] -- the document's text
drawing area drawing area [r/o] -- the document's drawing area
painting painting [r/o] -- the document's painting
spreadsheet spreadsheet [r/o] -- the document's spreadsheet
database database [r/o] -- the document's database
connection connection -- the document's connection
terminal terminal -- the document's terminal
file transfer file transfer -- the document's file transfer
stylesheet stylesheet [r/o] -- the document's stylesheet
preferences document preferences -- document preferences
modified boolean -- has the document been modified since the last save?
page setup print record -- the document's page setup
margins rectangle -- the document's margins
name string [r/o] -- the name of the document
index integer [r/o] -- the document number
document kind DR/WP/SS/DB/PT/CM [r/o] -- the document kind
file alias [r/o] -- the document's file
title plain text -- the title of the document
author plain text -- the author of the document
version plain text -- the version of the document
keywords plain text -- the keywords of the document
category plain text -- the category of the document
description plain text -- the description of the document
selection selection object -- the current user selection or insertion point for the document
merge file alias -- the database file with which to merge
merge record small integer -- the record index of the database record currently being merged
merge boolean -- is merge field data currently being shown?
autohyphenate boolean -- automatically hyphenate as you edit and type new text?
date format numeric date/short abbreviated date/short date/long abbreviated date/long date -- format to use when displaying dates
fractional character widths boolean -- use fractional character widths when drawing text?
smart quotes boolean -- use smart quotes?
side handles boolean -- use side handles (for a total of 8) when displaying object selection?
polygon autoclose boolean -- automatically close polygons?
show invisibles boolean -- show invisible characters in text?
color palette size 256 colors/81 colors -- type of palette to use to display color choices
autosmooth boolean -- automatically smooth freehand?
gradient drawing faster/better -- method to use for displaying gradients
shift constraint integer -- the angle at which the shift key constrains the mouse
character delay integer -- the number of 60ths of a second to delay per character when pasting text to a connection
line delay integer -- the number of 60ths of a second to delay per line when pasting text to a connection
save screen boolean -- save the screen to the scrollback before clearing?
capture type port/screen -- location from which to capture text
scrollback limit boolean -- limit the scrollback to a maximum size?
scrollback maximum integer -- maximum size of the scrollback (units are specified by scrollback type)
scrollback type lines/bytes/screens -- units for the maximum scrollback size
open option open connection/wait for connection/do nothing -- action to perform when opening the communications document
transfer folder alias -- the default folder for received files
name string [r/o] -- the document's name

Class file: A file
Plural form:
files
Properties:
stationery boolean [r/o] -- Is the file a stationery file?

Class selection object: the selection visible to the user
Properties:

contents type class [r/o] -- the contents of the selection

Class text: text
Elements:
text as a range of elements
character by numeric index, as a range of elements
footnote by numeric index, as a range of elements
section by numeric index, as a range of elements
paragraph by numeric index, as a range of elements
word by numeric index, as a range of elements
Properties:
font text -- the name of the font of the first character
style text style info -- the text style of the first character
user style record -- the user style (and incremental attributes) defining the first character's appearance
size real -- the size in points of the first character
writing code writing code [r/o] -- the script system and language of the first character
uniform styles text style info [r/o] -- the text styles which are uniform throughout the specified text
length integer [r/o] -- length of the text
offset integer [r/o] -- offset of the text from the beginning of the enclosing text object
<Inheritance> item [r/o] -- subclass of item

Class text style info: On and Off styles of text run
Plural form:
text style infos
Properties:
on styles a list of plain/bold/italic/outline/shadow/underline/double underline/superscript/subscript/strikethru/condense/extend/superior/inferior [r/o] -- the styles that are on for the text
off styles a list of plain/bold/italic/outline/shadow/underline/double underline/superscript/subscript/strikethru/condense/extend/superior/inferior [r/o] -- the styles that are off for the text

Class window: a document window
Plural form:
windows
Elements:
split by numeric index, as a range of elements, satisfying a test
pane by numeric index, as a range of elements, satisfying a test
'cBln' by numeric index
Properties:
name string [r/o] -- the window's name
document document [r/o] -- the document associated with the window
bounds bounding rectangle -- the boundary rectangle for the window
zoomed boolean -- Is the window zoomed?
position point -- upper left coordinates of the window
scale real -- the viewing scale (zoom percentage)
ruler ruler -- the ruler for this window
tools boolean -- is the tool panel for this window visible?
page view boolean -- is the window in page view?
database view browse view/find view/layout view/list view -- (for databases only) the view type for the database

Class insertion point: An insertion location between two objects
Plural form:
insertion points

ClarisWorks Suite: General terms for use with ClarisWorks

apply: Apply a user style to an object
apply reference -- the user style to apply
to reference -- the object to which to apply the style

arrange windows: Arrange windows, tiling or stacking them
arrange windows
by tiling/stacking -- how to arrange the windows
[direction horizontal/vertical] -- direction to tile windows

check spelling: Check the spelling of the of the specified text or object
check spelling
[of reference] -- the object or text to spell-check
[dialog boolean] -- display a dialog showing the misspelled words?
[Result: list] -- list of misspelled words

copy to clipboard: Copy the current selection to the clipboard
copy to clipboard

cut: Cut the current selection to the clipboard
cut

go to: Go to a specific slide
go to slide -- the slide to be displayed
[fade boolean] -- Specifies whether or not to fade when switching to the specified slide
[scaling boolean] -- Specifies whether to scale the slide to fit the screen
[center slide boolean] -- Specifies whether to center the slide on the screen
[cursor boolean] -- Specifies whether to make the cursor visible
[play movies boolean] -- Specifies whether to automatically play movies on the slide
[simultaneous boolean] -- Specifies whether to play movies simultaneously when automatically playing
[background RGB color] -- Specifies the color to use for the background of the slide
[border RGB color] -- Specifies the color to use for the border surrounding the slide

do script: Run the specified macro
do script plain text -- the name of the macro to run

find synonyms: Look up synonyms for the specified word in the thesaurus
find synonyms
for word -- the word to look up
[dialog boolean] -- display a dialog listing the synonyms?
[Result: synonym list] -- synonyms for the specified word

help: Display ClarisWorks' onscreen help
help integer -- topic number

insert: Insert a file into a document
insert alias -- the file to insert
[at location reference] -- the location at which to insert the file
[using translator string] -- the name of the XTND translator to use to import the document
[with fields plain text] -- the field order to use when inserting into a database (use "" to skip a field)

invoke assistant: Start an interactive session with a ClarisWorks assistant
invoke assistant plain text -- the name of the assistant to invoke

paste: Paste from the clipboard to the current selection
paste values/formulas/formats -- special things that can be pasted
[transpose boolean] -- transpose the data diagonally?

play: Start playing the specified object
play reference -- the object to play

reveal: Make the requested objects visible
reveal reference -- the object(s) to make visible
[in window reference] -- the window in which to display the objects

revert: revert to the last saved version of a document
revert document -- the document to be reverted

select: Select the specified object
select reference -- the object to be selected

sort: Sort an object by one or more of its elements. (Database or Spreadsheet)
sort reference -- the object to sort
[with key reference] -- the key element(s) on which to sort

[direction ascending/descending] -- the direction in which to sort

speak: Use PlainTalk to speak some text
speak plain text -- the text to speak
[using voice string] -- the name of the PlainTalk voice to use

start slides: Start the slideshow for the current document
start slides

stop: Stop playing the specified object
stop reference -- the object to stop playing

stop slides: Stop the slideshow, returning to the normal application state
stop slides

remove: Unapply a user style to an object
remove reference -- the user style to apply
from reference -- the object from which to remove the style

Class application preferences: preferences which apply globally throughout the application
Properties:
terminal speech boolean -- speak text in communication documents?
WYSIWYG fonts boolean -- display WYSIWYG font menu?
arrow Keys move caret/change cells -- action to take in spreadsheet entry bar when arrow keys are pressed
enter mode enter mode/return mode/tab mode -- action to take in spreadsheet when Enter is pressed
old version warning boolean -- display warning alert when opening a document created by an older version?
locked file warning boolean -- display warning alert when opening a locked document?
paint reduction warning boolean -- display warning alert when size of new paint document is reduced due to memory constraints?
converted file suffix boolean -- append "[v4.0]" to documents converted from older formats?
preview boolean -- create a preview for saved documents?
custom icon boolean -- create a custom icon for saved documents?
startup option do nothing/show new/show open -- action to take when launched
default font text -- the name of the default font
remember translator boolean -- when saving, set the default export translator to be the same as the import translator?
mail quote type at bottom/at top -- when quoting mail in a reply, the quoting etiquette to use
word services boolean -- enable word services in the Writing Tools menu?
quote indent plain text -- when quoting mail, the text with which to indent each paragraph
connection tools a list of string [r/o] -- connection tools available to the application
terminal tools a list of string [r/o] -- terminal tools available to the application
file transfer tools a list of string [r/o] -- file transfer tools available to the application
default connection connection -- default connection to use in new communication documents
default terminal terminal -- default terminal to use in new communication documents
default file transfer file transfer -- default file transfer to use in new communication documents

Class document preferences: preferences which apply to individual documents
Properties:
date format numeric date/short abbreviated date/short date/long abbreviated date/long date -- format to use when displaying dates (default for new documents)
fractional character widths boolean -- use fractional character widths when drawing text? (default for new documents)
smart quotes boolean -- use smart quotes? (default for new documents)
side handles boolean -- use side handles (for a total of 8) when displaying object selection? (default for new documents)
polygon autoclose boolean -- automatically close polygons? (default for new documents)
show invisibles boolean -- show invisible characters in text? (default for new documents)
color palette size 256 colors/81 colors -- type of palette to use to display color choices (default for new documents)
autosmooth boolean -- automatically smooth freehand? (default for new documents)
gradient drawing faster/better -- method to use for displaying gradients (default for new documents)
shift constraint integer -- the angle at which the shift key constrains the mouse (default for new documents)
character delay integer -- the number of 60ths of a second to delay per character when pasting text to a connection (default for new documents)
line delay integer -- the number of 60ths of a second to delay per line when pasting text to a connection (default for new documents)
save screen boolean -- save the screen to the scrollback before clearing? (default for new documents)
capture type port/screen -- location from which to capture text (default for new documents)
scrollback limit boolean -- limit the scrollback to a maximum size? (default for new documents)
scrollback maximum integer -- maximum size of the scrollback (units are specified by scrollback type) (default for new documents)
scrollback type lines/bytes/screens -- units for the maximum scrollback size (default for new documents)
open option open connection/wait for connection/do nothing -- action to perform when opening the communications document (default for new

documents)
transfer folder alias -- the default folder for received files (default for new documents)

Class footer: the document's footer
Plural form:
footers
Properties:
orientation left pages/right pages/all pages -- the orientation of the footer
<Inheritance> text [r/o] -- subclass of text

Class header: the document's header
Plural form:
headers
Properties:
orientation left pages/right pages/all pages -- the orientation of the header
<Inheritance> text [r/o] -- subclass of text

Class library: a library of graphic objects
Plural form:
libraries
Elements:
graphic object by numeric index, by name
Properties:
name string [r/o] -- the name of the library
file alias [r/o] -- the library's file
palette palette [r/o] -- the library's floating palette
<Inheritance> item [r/o] -- subclass of item

Class menu: A menu
Plural form:
menus
Elements:
menu item by numeric index, by name, as a range of elements
Properties:
name string [r/o] -- the name of the menu
id small integer [r/o] -- the menu id
<Inheritance> item [r/o] -- subclass of item

Class menu item: A menu item. Use "select" to perform a menu item action.
Plural form:
menu items
Properties:
name string [r/o] -- the name of the menu
index integer [r/o] -- the menu item number
enabled boolean [r/o] -- is the menu item enabled?
checked boolean [r/o] -- is the menu item checked?
check character plain text [r/o] -- the character used to check this menu item
<Inheritance> item [r/o] -- subclass of item

Class page: A page
Plural form:
pages
Properties:
index integer [r/o] -- the page number
<Inheritance> item [r/o] -- subclass of item

Class palette: A floating palette window
Plural form:
palettes
Properties:
bounds bounding rectangle -- the boundary rectangle for the window
closeable boolean [r/o] -- Does the window have a close box?
titled boolean [r/o] -- Does the window have a title bar?
index integer -- the number of the window
floating boolean [r/o] -- Does the window float?

modal boolean [r/o] -- Is the window modal?
resizable boolean [r/o] -- Is the window resizable?
zoomable boolean [r/o] -- Is the window zoomable?
zoomed boolean -- Is the window zoomed?
visible boolean -- Is the window visible?
position point -- upper left coordinates of the window
name string [r/o] -- the palette's name
<Inheritance> item [r/o] -- subclass of item

Class pane: A window pane
Plural form:
panes
Properties:
bounds bounding rectangle -- the bounds of the pane
<Inheritance> item [r/o] -- subclass of item

Class pattern: a pattern
Plural form:
patterns

Class print record: Printer-specific page setup information
Plural form:
print records
Properties:
<Inheritance> item [r/o] -- subclass of item

Class ruler: a ruler
Plural form:
rulers
Properties:
visible boolean [r/o] -- is the ruler visible?
ruler kind graphics ruler/text ruler [r/o] -- the type of ruler
unit lines/inches/millimeters/centimeters/picas/points [r/o] -- the unit of measurement of the ruler
divisions small integer -- the number of divisions per unit in this document's rulers
<Inheritance> item [r/o] -- subclass of item

Class ruler measurement info: a fixed value and its unit of measurement
Properties:
value real [r/o] -- the amount
unit lines/inches/millimeters/centimeters/picas/points [r/o] -- the unit of measurement applied to the value
<Inheritance> item [r/o] -- subclass of item

Class slide: A slide which may be displayed in the slide show
Plural form:
slides
Properties:
index integer -- the number of the slide
transition mode opaque/transparent/hidden [r/o] -- the way the slide is displayed relative to previous slides
<Inheritance> item [r/o] -- subclass of item

Class split: A split bar dividing two panes
Plural form:
splits
Properties:
position small integer -- the position of the split bar in the window
orientation horizontal/vertical [r/o] -- the orientation of the split bar
<Inheritance> item [r/o] -- subclass of item

Class style attribute: an attribute of a user style
Plural form:
style attributes
Properties:
class type class [r/o] -- the attribute's class
<Inheritance> record [r/o] -- subclass of record

Class stylesheet: stylesheet
Plural form:
stylesheets
Elements:
user style by numeric index, by name
Properties:
<Inheritance> item [r/o] -- subclass of item

Class synonym list: a list of synonyms
Plural form:
synonym lists
Elements:
list
Properties:
speech part noun/verb/adjective/adverb/pronoun [r/o] -- the type of word

Class tab stop: a tab stop
Plural form:
tab stops
Properties:
tab type left/right/center/align on -- the tab's alignment type
position real -- the tab's position in the ruler
alignment character plain text -- (for align-on tabs) the character on which to align
fill character plain text -- the character with which to fill the tab space
<Inheritance> item [r/o] -- subclass of item

Class texture: a texture
Plural form:
textures

Class user style: user-defined style
Plural form:
user styles
Elements:
style attribute by numeric index
Properties:
name string -- the name of the user style
style type basic style/paragraph style/outline style/table style [r/o] -- the style type
base style user style -- the user style this one is based on
incremental styles a list of style attribute -- attributes applied to an object in addition to the user style

Class XTND translator: an XTND file translator
Plural form:
XTND translator
Properties:
name string [r/o] -- the name of the translator
translator type text translator/graphic translator/spreadsheet translator/database translator/spreadsheet or database translator [r/o] -- the translator type
translation import only translation/export only translation/import and export translation [r/o] -- the translations supported
<Inheritance> item [r/o] -- subclass of item

ClarisWorks Text Suite: Terms for use with word processing

Class footnote: a footnote
Plural form:
footnotes
Properties:
label plain text -- the label associated with this footnote
index integer [r/o] -- the index of this footnote in the text
<Inheritance> text [r/o] -- subclass of text

Class paragraph: a paragraph
Plural form:

paragraphs
Elements:
character by numeric index, as a range of elements
footnote by numeric index
tab stop by numeric index
text as a range of elements
Properties:
index integer [r/o] -- the index of this paragraph in the text
level integer -- the outline level
left indent ruler measurement info -- the left indentation
right indent ruler measurement info -- the right indentation
first line indent ruler measurement info -- the initial indentation of the first line
line spacing ruler measurement info -- the space between the lines of a paragraph
space before ruler measurement info -- the space before a paragraph
space after ruler measurement info -- the space after a paragraph
label none/diamond label/bullet label/checkbox label/Harvard label/leader label/legal label/letter label/letter caps label/numeric label/Roman label/Roman caps label -- the outlining label type associated with a paragraph
justification left/right/center/full -- Justification of the text
<Inheritance> text [r/o] -- subclass of text

Class section: a section
Plural form:
sections
Elements:
character by numeric index, as a range of elements
footnote by numeric index
tab stop by numeric index
text as a range of elements
'cTxC'
Properties:
index integer [r/o] -- the index of this section in the text
<Inheritance> text [r/o] -- subclass of text

Class word: A word
Plural form:
words
Elements:
character by numeric index, as a range of elements
text as a range of elements
Properties:
index integer [r/o] -- the index of this word in the text
<Inheritance> text [r/o] -- subclass of text

ClarisWorks Database Suite: Terms for use with databases

hide: Hide a set of database records
hide reference -- the records to hide

search: search for a set of records, showing or hiding them
search database -- the database to search
[looking for record] -- records containing the search criteria
[omitting record] -- records containing the omission criteria
[matching plain text] -- a ClarisWorks formula specifying the records to be shown
[from all records/visible records] -- the set of records to search
Result: integer -- the number of records found

show: show a set of database records
show reference -- the records to show

Class database: a database
Plural form:
databases
Elements:

layout by name, by numeric index
field by name, by numeric index
record by numeric index, as a range of elements, satisfying a test
report by name, by numeric index
db search by name, by numeric index
db sort by name, by numeric index
request by numeric index, as a range of elements
Properties:
current record integer -- the current record
<Inheritance> item [r/o] -- subclass of item

Class db search: a canned database search
Plural form:
db searches
Properties:
name string [r/o] -- the name of the search
<Inheritance> item [r/o] -- subclass of item

Class db sort: a canned database sort
Plural form:
db sorts
Properties:
name string [r/o] -- the name of the sort
<Inheritance> item [r/o] -- subclass of item

Class field: a database field
Plural form:
fields
Properties:
name string [r/o] -- the name of the field
index integer [r/o] -- the index of the field
<Inheritance> item [r/o] -- subclass of item

Class layout: a database layout
Plural form:
layouts
Properties:
name string -- the name of the layout
show multiple boolean -- show multiple records at a time?
index integer [r/o] -- the record number
drawing area drawing area [r/o] -- the character's drawing area (only for embedded graphics)
<Inheritance> item [r/o] -- subclass of item

Class record: a database record
Plural form:
records
Elements:
field by name, by numeric index
Properties:
visible boolean [r/o] -- is the record visible?
index integer [r/o] -- the record number
id small integer [r/o] -- the record id
creation date date [r/o] -- the date/time the record was created
modification date date [r/o] -- the date/time the record was last modified
<Inheritance> item [r/o] -- subclass of item

Class report: a database report
Plural form:
reports
Properties:
name string [r/o] -- the name of the report
<Inheritance> item [r/o] -- subclass of item

Class request: a database request record
Plural form:

requests
Elements:
field by name, by numeric index
Properties:
index integer [r/o] -- the request number
<Inheritance> item [r/o] -- subclass of item

ClarisWorks Spreadsheet Suite: Terms for use with spreadsheets

recalculate: Recalculate a spreadsheet
recalculate spreadsheet -- the spreadsheet to recalculate

Class axis: axis
Plural form:
axes

Class cell: A cell
Plural form:
cells
Elements:
cell by numeric index, as a range of elements
row by numeric index, as a range of elements
column by numeric index, as a range of elements
Properties:
formula text -- the formula of the cell
format general/currency/percent/scientific notation/fixed/numeric date/short abbreviated date/short date/long abbreviated date/long date/short time/long time/short military time/long military time -- the cell format
lock read only/read write -- Indicates whether value or formula in the cell can be changed
name plain text -- the name of the cell (e.g., "A1")
color RGB color -- the cell's text color
font text -- the name of the font of the cell
size real -- the size in points of the cell text
writing code writing code [r/o] -- the script system and language of the cell text
style text style info -- the text style of the cell
fill color RGB color -- the fill color
fill pattern integer -- the fill pattern
alignment general/left/right/center -- justification of the text
decimal places integer -- digits of precision
commas boolean -- display numbers with thousands separators?
parentheses boolean -- display negative numbers in parentheses?
wrap boolean -- wrap text within a cell?
left border boolean -- draw a border on the left side of the cell?
top border boolean -- draw a border on the top of the cell?
right border boolean -- draw a border on the right side of the cell?
bottom border boolean -- draw a border on the bottom of the cell?
outline border boolean -- draw a border framing the range of cells?
user style record -- the user style (and incremental attributes) defining the cell's appearance
<Inheritance> item [r/o] -- subclass of item

Class chart: a graphic chart of spreadsheet data
Plural form:
charts
Elements:
axis
series
Properties:
range reference -- the spreadsheet range which is charted
chart kind bar chart/area chart/line chart/scatter chart/pie chart/pictogram chart/stacked bar chart/stacked area chart/XY line chart/XY scatter chart/high low chart/stacked pictogram chart -- the type of chart
title 'cChT' -- the title of the chart
legend 'cChL' -- the legend of the chart
in color boolean -- is the chart in color?
is shadowed boolean -- does the chart have a drop shadow?

three dimensional boolean -- are the chart bars three dimensional?
tilted boolean -- are the pies displayed tilted?
scale multiple boolean -- are multiple pies scaled based on their total data size?
square grid boolean -- does the X/Y grid have a square aspect?
series arrangement type class -- the arrangement of data within the spreadsheet for series (rows or columns)
row label boolean -- use numbers as labels in the first row?
column label boolean -- use numbers as labels in the first column?
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class chart title: a chart's title
Properties:
position top left/top center/top right/center left/center center/center right/bottom left/bottom center/bottom right -- the position of the title relative to the chart
orientation horizontal/vertical [r/o] -- the orientation of the title
is shadowed boolean -- does the title have a drop shadow?

Class chart legend: a chart's legend
Properties:
position top left/top center/top right/center left/center center/center right/bottom left/bottom center/bottom right -- the position of the legend relative to the chart
orientation horizontal/vertical [r/o] -- the orientation of the legend
is shadowed boolean -- does the legend have a drop shadow?
use symbol boolean -- should the legend display the series symbol?

Class column: A column
Plural form:
columns
Elements:
cell by numeric index, as a range of elements
row by numeric index, as a range of elements
column by numeric index, as a range of elements
Properties:
name plain text -- the name of the column
index integer [r/o] -- the column number
width integer -- the width of the column in pixels
<Inheritance> item [r/o] -- subclass of item

Class named range: a user-defined range of cells
Plural form:
named ranges
Elements:
cell by numeric index
Properties:
name string -- the name of the range
<Inheritance> item [r/o] -- subclass of item

Class row: A row
Plural form:
rows
Elements:
cell by numeric index, as a range of elements
row by numeric index, as a range of elements
column by numeric index, as a range of elements
Properties:
index integer [r/o] -- the row number
height integer -- the height of the row in pixels
<Inheritance> item [r/o] -- subclass of item

Class series: series
Properties:
picture picture -- the pictogram picture
repeating boolean -- does the pictogram repeat?
percent overlap small integer -- if the pictogram repeats, the percentage of it which overlaps
label data boolean -- should the series be directly labeled
position top left/top center/top right/center left/center center/center right/bottom left/bottom center/bottom right -- if the series is labeled, the

position of the label relative to the series
chart kind bar chart/area chart/line chart/scatter chart/pie chart/pictogram chart/stacked bar chart/stacked area chart/XY line chart/XY scatter chart/high low chart/stacked pictogram chart -- the type of chart

Class spreadsheet: A spreadsheet
Plural form:
spreadsheet
Elements:
row by numeric index, as a range of elements
column by name, by numeric index, as a range of elements
cell by name, by numeric index, as a range of elements
chart by numeric index
named range by name, by numeric index
Properties:
data bounds named range [r/o] -- the range that data occupies in the spreadsheet
<Inheritance> item [r/o] -- subclass of item

ClarisWorks Graphics Suite: Terms for use with graphics

Class arc: An arc
Plural form:
arcs
Properties:
arc angle small integer -- Angle of the arc in degrees
start angle small integer -- the angle that defines the start of the arc, in degrees
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class drawing area: Container for graphics and supporting information
Plural form:
drawing areas
Elements:
graphic object
Properties:
<Inheritance> item [r/o] -- subclass of item

Class gradient: a gradient
Properties:
gradient kind linear/circular/burst [r/o] -- the type of gradient
colors a list of RGB color -- the reference colors of the gradient (1 - 4)
angle integer -- the angle for linear or circular gradients
offset real -- flip position for linear gradients; 0.0 = center, 1.0 = edge
bounds bounding rectangle -- the center for burst or circular gradients, relative to {0, 0, 100, 100}
<Inheritance> item [r/o] -- subclass of item

Class group: Group of graphics
Plural form:
groups
Properties:
drawing area drawing area [r/o] -- the character's drawing area (only for embedded graphics)
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class graphic object: two-dimensional objects
Plural form:
graphic objects
Properties:
bounds bounding rectangle -- the smallest rectangle that contains the entire graphic object
fill color RGB color -- the fill color
fill pattern integer -- the fill pattern
fill gradient integer -- the fill gradient
fill texture integer -- the fill texture
pen color RGB color -- the pen color
pen pattern integer -- the pen pattern
pen width real -- the pen width

rotation integer -- the rotation of this object in degrees from horizontal
definition rectangle bounding rectangle -- the rectangle used to define the object; this is usually the same as the bounds except when the object is rotated
text wrap no wrap/regular wrap/irregular wrap -- the way in which text should wrap around an object
wrap gutter ruler measurement info -- the amount of space to allow between an object and the text wrapping around it
lock read only/read write -- indicates whether or not the object may be moved, deleted, or modified
user style record -- the user style (and incremental attributes) defining the object's appearance
<Inheritance> item [r/o] -- subclass of item

Class line:
Plural form:
lines
Properties:
end point point -- the ending point of the line
arrow style no arrow/arrow at start/arrow at end/arrow at both ends -- the arrow style
start point point -- the starting point of the line
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class movie: a QuickTime movie
Plural form:
movies
Properties:
original bounds bounding rectangle -- the rectangle that bounds the object at normal size
loop none/forward/back and forth -- how the movie should loop while playing
playing boolean [r/o] -- is the movie currently playing?
rate real -- the rate at which the movie plays
direction forward/backward -- the direction the movie plays
duration real [r/o] -- the duration of the movie (at a rate of 1.0)
current time real -- the current time position within the movie
volume real -- the sound volume of the movie when playing
modified boolean -- has the movie been modified since the document was last saved?
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class oval:
Plural form:
ovals
Properties:
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class paint frame: a pixel map within a drawing area
Plural form:
paint frames
Properties:
painting painting [r/o] -- the object's painting
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class picture: a QuickDraw picture
Plural form:
pictures
Properties:
original bounds bounding rectangle -- the rectangle that bounds the object at normal size
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class pixel: A pixel
Plural form:
pixels
Properties:
color RGB color -- the color

Class painting: A painting pixel map
Plural form:
paintings
Elements:
pixel by numeric index, as a range of elements
Properties:

<Inheritance> item [r/o] -- subclass of item

Class polygon: A polygon
Plural form:
polygons
Elements:
vertex by numeric index
Properties:
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class rectangle: A rectangle
Plural form:
rectangles
Properties:
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class rounded rectangle: A rounded rectangle
Plural form:
rounded rectangles
Properties:
corner radius small integer -- the radius of the arcs used to draw the corners
round ends boolean -- should the shorter sides of the object be drawn by a half circle? (overrides corner radius)
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class spreadsheet frame: a spreadsheet within a drawing area
Plural form:
spreadsheet frames
Properties:
spreadsheet spreadsheet [r/o] -- the object's spreadsheet
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class text frame: a text object within a drawing area
Plural form:
text frames
Properties:
text body text [r/o] -- the object's text
<Inheritance> graphic object [r/o] -- subclass of graphic object

Class vertex: a vertex of a polygon
Plural form:
vertices
Properties:
vertex location point -- location of the vertex
control point 1 point -- location of first control point
control point 2 point -- location of second control point
smooth boolean -- true if control points are tied together
autosmooth boolean -- true if control points are auto-generated

ClarisWorks Communications Suite: Terms for use with communications

match: Match a string or idle time in a communications document
match connection -- the connection on which to match
with condition record -- list of conditions to match
Result: integer -- result code designating the condition matched

receive: Receive a file
receive alias -- the location for the to be received
via file transfer -- the file transfer to use to receive the file(s)

send: Send a file or text using the specified communications document. In order to send a list of files, the document's file transfer must support batch transfers.
send anything -- the file(s) or text to send
via document -- the communications document to use to send the text or file(s)

Class condition record: a result code and a match condition: either a timeout or text
Plural form:
condition records
Properties:
result code integer [r/o] -- the result code returned upon successfully matching this condition
timeout integer [r/o] -- the number of seconds of idle time to match
match text plain text [r/o] -- the text to match
<Inheritance> item [r/o] -- subclass of item

Class connection: a communications toolbox connection
Properties:
status disconnected/connected/connecting/disconnecting/waiting/answering [r/o] -- the connection's status
name string [r/o] -- the tool's name
configuration string -- the tool's configuration
version version [r/o] -- the tool's version number
<Inheritance> item [r/o] -- subclass of item

Class file transfer: a communications toolbox file transfer
Properties:
status idle/sending/receiving [r/o] -- the file transfer's status
name string [r/o] -- the tool's name
configuration string -- the tool's configuration
version version [r/o] -- the tool's version number
batch boolean [r/o] -- can this tool send multiple files?
<Inheritance> item [r/o] -- subclass of item

Class terminal: a communications toolbox terminal
Properties:
text body text [r/o] -- the terminal's text
scrollback text [r/o] -- the terminal's scrollback text
name string [r/o] -- the tool's name
configuration string -- the tool's configuration
version version [r/o] -- the tool's version number
<Inheritance> item [r/o] -- subclass of item

Disk Copy 6.3: -50 Error When Making Image

When creating a disk image of a compact disc (CD) or hard drive, Disk Copy 6.3 reports it could not complete the operation due to a -50 error.
This article has been archived and is no longer updated by Apple.
This is a known issue with Disk Copy 6.3 only. When making an image from a volume that has data stored at the end of the volume, Disk Copy 6.3 will not complete the image operation and report a -50 error.

Workarounds:
1) Media that is not read-only can be optimized so that all free space is at the end blocks of the volume.
2) When saving a volume as a disk image, change the size of the image so that it is slightly larger.

This issue has been addressed in the latest version of Disk Copy 6.x, which can be downloaded from the Apple Software Updates Web site at http://www.apple.com/swupdates.

iMac: Infrared Communications

Does iMac support infrared communications? How does it work?
This article has been archived and is no longer updated by Apple.
Note: The infrared port was removed from the iMac beginning with the multi-colored versions introduced in January, 1999.

The iMac does support infrared communications via the Infrared (or IR) transmitter/receiver located behind a dark plastic cover next to the left speaker.

The infrared lens transmits infrared light in a 30-degree radius, pointing outward from the computer. The recommended minimum distance between devices is 1 meter.

The iMac transmits files using the IrDA protocol, which transmits data up to 4 megabits per second and is capable of using AppleTalk and TCP/IP protocols. The iMac infrared port is compatible with some PowerBook computers including the PowerBook 2400, 3400, G3 and PowerBook G3 Series computers. Other infrared capable Apple products are not compatible because they use a different infrared lens and transmitter.

For infrared to function properly with the iMac, the following items must be installed:

- Infrared Control Panel
- IrDALib Extension
- IrLanScanner/PPC Extension

Infrared Control Panel
The Infrared Control Panel provides information about an active Infrared connection as well as infrared type.

Note: The Infrared Control Panel will not open if one of the following conditions occur:

-IrDALib Extension, InLanScanner/PPC Extension, or Infrared Control Panel are missing, disabled, or corrupted
-The Infrared controller board is defective
-The iMac does not recognize the controller board

Additional information on IrDA compatibility can be found in the following Knowledge Base article:
Article 20928: **Macintosh Infrared: Is It IrDA Compatible?**
Published Date: Feb 20, 2012

Apple USB Mouse and Keyboard

This article discusses the Apple USB keyboard and mouse shipped with the iMac, Power Macintosh G3 (Blue and White) and Power Mac G4.

This article has been archived and is no longer updated by Apple.

Apple USB Keyboard

The Apple USB Keyboard and Mouse introduced with the original iMac were Apple's first USB devices. The USB Keyboard provides the functionality of past keyboards, while keeping pace with and following USB standards. Two USB sockets are located on each side of the upper half of the keyboard. These sockets allow the connection of other USB devices. Note: Any USB device connected to the Apple USB Keyboard must be either a self-powered device (a USB device with its own AC power supply), or a low-power device (a device that does not need a large amount of voltage to operate).

The Apple USB Keyboard has a soft power on/off button on the upper right half of the keyboard. Unlike the iMac Power On/Off button, the Apple USB Keyboard power on/off button does NOT light up when the iMac is powered on.

Apple USB Mouse

The Apple USB Mouse offers a radical new design. Unlike older Apple mice, the iMac mouse is a USB device. Physically, the Apple USB mouse is round, smaller than previous Apple mice, and sleek with a lower profile. The mouse ball is two-toned in color and heavier in weight.

The Apple iMac USB Mouse can be hot plugged into:

- USB ports on the Apple USB Keyboard
- USB ports on the iMac
- Any available Type A socket on other USB devices

Locking the Apple USB Mouse

To prevent the Apple USB Mouse ball from being removed, you can lock the mouse as described below:

1. Insert a straightened paper clip into the hole on the inner plastic ring.
2. Press down on the paper clip and turn the ring clockwise until it stops and clicks into position (usually at a slight angle to the rest of the mouse).
3. The mouse ring is locked when the ring clicks into a position at a slight angle to the rest of the mouse.
4. To unlock the mouse, reverse the process.

iMac: Sound Recording Options

iMac has the following sound recording options.
This article has been archived and is no longer updated by Apple.
The iMac has three different sound-in sources:

- the built-in microphone
- the microphone jack
- the CD-ROM drive

Audio output can be provided by three different methods:

- internal stereo speakers
- headphones or external speakers in the headphone jacks on the front of the iMac
- headphones external speakers connected to the Line output jack in the side panel of the iMac

Line output is a sound-out port that does not amplify the sound. If you compare the line-output port and the headphone port, the line-output port will have lower volume levels.

Recording Sounds - The Equipment Needed

The iMac can use a number of sources to record sound. The table shown below identifies the sound source, microphone compatibility, OS recording capability, and the connection type.

Sound-in Source	PlainTalk Microphone Compatible?	Omnidirectional Microphone Compatible?	Can OS Record From?	Connection Type
Built-In Microphone	Yes	No	Yes	Built-In
External Microphone	Yes	No	Yes	Headphone Plug
CD-ROM Audio	No	No	Yes	CD Audio Cable

CD-ROM Audio is the analog audio signal that is provided by CD audio disks, NOT sounds that may be part of CD-ROM titles.

The side microphone jack can use either a third-party microphone or an Apple PlainTalk microphone. There is a difference between a PlainTalk microphone and third-party microphones. PlainTalk microphones are amplified by the computer. They receive power for amplification from an 1/8 inch plug extension that makes contact with specific connections in the microphone port. That's why the plug on the PlainTalk microphone is longer than other external computer microphones. Remember that both types of plugs may be used in the side microphone jack.

The iMac has the ability to record sounds within a bandwidth of 44.100 KHz; it will not record sounds at 11 or 22 KHz bandwidths.

Note: iMac will support Apple Speech Recognition with version 1.5.4 of the English Speech Recognition software available from the Apple Software Updates web site at **http://www.apple.com/swupdates**.

Sound-Out Source	Amplified Signal?	Analog or Digital	Built-in Speakers Muted When Using...	Muted with Headphones?	Uses SRS?	Connection Type
Built-in Speakers	Yes	Analog	n/a	Yes	Yes	Internal Connection
Line-out Jack	No	Analog	yes	Yes	Yes	Headphone Plug
Headphone Jacks	Yes	Analog	yes	No	Yes	Headphone Plug

The Monitors and Sound control panel lets you select the source that you want to record from. The control panel displays the current recording quality, output port, and whether or not SRS 3D stereo sound is active. As shown above, SRS 3D sound works with any of the output sources.

iMac: System Software Reinstall Options

This article describes the options for reinstalling iMac system software.
This article has been archived and is no longer updated by Apple.
The iMac comes with two CDs that allow you to reinstall system software, the iMac System Software CD and the iMac Restore CD. Each CD is bootable.

iMac System Software CD - This CD contains installation files that will reinstall the iMac version of the Mac OS. To reinstall the system software, use the Installer application and follow the standard Mac OS 8.1 installer procedures. Installers for utilities and bundled applications are also present on this CD.

iMac Restore CD - The Restore CD contains an image of the iMac hard disk as it was shipped to you. A utility called Apple Software Restore allows you to restore the hard disk to that configuration. The Restore utility has a number of options to control formatting of the hard disk or saving of data and applications before using the Restore utility. Read the Restoring iMac Software text file to understand how to prevent accidental data loss.

To restore the iMac hard disk
If your computer came with both Mac OS 9.1 and Mac OS X installed on the hard disk, you should follow the restore procedure outlined in Article 60847 "**Apple Software Restore: How to Perform a Multiple Disc Restoration**"

Start the system with the Restore CD in the CD drive while pressing and holding down the C key. This action causes the computer to boot from the software on the CD-ROM instead of the hard disk. You will see that the CD icon in the Finder is then located above the hard disk icon on the desktop. Double-click on the CD icon and double click on the Apple Software Restore icon. After launching Apple Software Restore, you should see the following splash screen. Click the OK button to continue.

Apple Software Restore Options

Restore in Place
Click the Restore button to restore the configuration "Mac Restore CD" onto "Macintosh HD," Overlapping files on "Macintosh HD" will be replaced by the corresponding files in "Mac OS.img."

Erase Macintosh HD before restoring
Click the Restore button to restore the configuration "Mac Restore CD" onto "Macintosh HD," using Macintosh Extended volume format. "Macintosh HD" will be usable as a startup volume only on PowerPC computers. The contents of "Macintosh HD" will be erased before restoring

Default setting: If neither Restore in Place or Erase "Macintosh HD" is checked, you can use the Volume Format menu to choose Standard or Extended format. You will see this information in the "Descriptions" window:

Click the Restore button to restore the configuration "Mac Restore CD" onto "Macintosh HD," The existing contents of "Macintosh HD," will be moved to a folder named "Original Items."

The iMac Restore CD also contains a utilities folder that allows you to perform checks on the hard disk. The utilities folder contains a set of standard Apple troubleshooting tools and utilities.

Finally, there is a folder on the Restore CD called Configurations. This folder contains a disk image file which includes all the iMac's software that the Apple Software Restore utility copies to the hard disk during restoration.

iMac: How Printers Show Up In Chooser With USB Adapter

Since none of Apple's previous printers supported USB, will they work if I purchase a serial to USB adapter? What will the Chooser show when I select the driver for my printer?
This article has been archived and is no longer updated by Apple.
Some of Apple printer drivers may not recognize the absence of the serial ports on the iMac.

The following list identifies Apple printer drivers that will show the standard printer port and modem port, and those that will show <No Printer Port> and <No Modem Port>.

Serial Printer Driver
What the Chooser Shows

Color StyleWriter 1500
<No Printer Port>
<No Modem Port>

Color StyleWriter 2500
<No Printer Port>
<No Modem Port>

Color StyleWriter Pro
<Serial Port>
<Serial Port>

LaserWriter 300/LS
<Serial Port>
<Serial Port>

ImageWriter
<Serial Port>
<Serial Port>

StyleWriter 1200
<No Printer Port>
<No Modem Port>

Note: The Color StyleWriter 1500, 2500, and the StyleWriter 1200 are all recent drivers that recognize the absence of serial ports on the iMac. The Color StyleWriter Pro, LaserWriter 300/LS, and ImageWriter drivers cannot sense the absence of the serial ports and will still display a choice of connection ports. If users try to print with any of these printer drivers, the print job will spool and then give the error message that the printer cannot be found.

If you have installed a third-party USB-to-serial adapter, the behavior of these drivers may vary. Refer to the serial adapter documentation for more information.

USB: Basic USB Printer Troubleshooting

This article explains how to test the basic functionality of a USB printer.
This article has been archived and is no longer updated by Apple.
The following steps will verify the basic functionality of a USB printer connected to a USB capable Macintosh computer.

Before performing the troubleshooting steps, make sure of the following:

- Plug the printer into a USB port on the computer.
- Confirm that the USB printer is powered on.
- Confirm that the USB printer is selected in the Chooser.
- Close and reopen the Chooser and confirm that the USB printer is still selected.
- Verify that there are no extra blank selectable lines in the Chooser "Connect To" window. (Clicking on the blank area below the printer and modem ports should deselect what is active.)

Note: Successfully completing any THREE of the following procedures will show that the USB printer is working correctly. A number of procedures are offered to account for differences in setup, software, and available printer options.

- Print a one-page document which includes text and graphics from a word processor such as AppleWorks or Microsoft Word.
- Print a five-page document which includes multiple fonts and font sizes using either SimpleText or AppleWorks.
- Print test documents from your word processor using different printing options (odd/even pages, from/to pages, etc.).
- Print the Desktop.
- Print in grayscale.

If a known-good USB printer does not print, try the following steps:

1. Verify computer has correct driver installed. Check vendor's web site to download current driver.
2. Reset PRAM.
3. Verify printer is selected in the Chooser.
4. Run Apple System Profiler to see if it recognizes the USB printer is connected. If it does, it is a software issue.
5. Try another USB port. Make sure the printer is connected directly to the computer.
6. Check cables.

Mac OS 8, 9: Startup key combinations for troubleshooting

This article has been archived and is no longer updated by Apple.

Learn standard startup key combinations used for troubleshooting most Macintosh computers in Mac OS 8 and 9. Some functions may not be applicable for every Macintosh computer.

Reset the PRAM
Hold down the Command+Option+P+R keys during the restart sequence. The computer will beep for a normal startup and will beep again. When you hear the second beep, release the keys.

Turn Off Extensions
Hold down the Shift key at startup until you see the Welcome to Macintosh screen.

Rebuild the Desktop
Start or restart the computer while holding down the Command-Option keys.

Disable Virtual Memory
Hold down the Command key at startup. Do not release the key until startup is complete.

Extension Manager
Bring up the Extension Manager at startup by holding down the Space Bar.

Force Reboot
Force reboot by holding the Command + Control + Power key.

Startup From Bootable CD-ROM
Hold down the letter c key upon boot (lower-case only).

Eject floppy or other removable media
Hold down the mouse button on boot.

Power Macintosh G3: Tips for Downloading Images from Olympus Cameras

I have an Olympus digital camera and it seems to have difficulty establishing communications with my Power Macintosh G3 computer. Because of this I cannot download images to my computer.
This article has been archived and is no longer updated by Apple.
There are a number of methods to enhance the digital camera's ability to establish communications with the Power Macintosh, the main issue is related to high power consumption when making the initial connection.

Don't use alkaline batteries. They lose power very quickly when taking pictures and downloading images requires even more power. Batteries that are reported to be dead by the camera may show power when checked with a battery tester. The camera places high loads on the batteries and the internal battery circuitry will report a low or dead battery when it reaches a level which cannot support the camera. The batteries may be usable in other devices such as a flashlight or radio.

What to use instead of alkaline batteries? Get an AC adapter and use it whenever you download images. The adapter will supply sufficient power to the camera for downloading images without running the batteries down.

Use Nickel Metal Hydride (NiMH) rechargeable batteries as another alternative to alkaline batteries. The NiMH chemistry works well in high power devices such as portable computers and digital cameras.

Olympus technical support offers the following advice for downloading images to your Macintosh:

1. Boot the system up using the base extensions

2. Turn AppleTalk off via the AppleTalk control panel regardless of whether or not you attach the camera to the serial port that is assigned as the AppleTalk port. To disable AppleTalk from the AppleTalk control panel you must set your user mode to Advanced, then click the Options button.

   From the AppleTalk control panel, select the "Connect via" option to be something other than the port connected to the camera (that is, if you connect the camera to the printer port, select modem port).

3. Allocate as much memory as you can to the application.

4. With the camera off, initiate a download request from the software. Wait 2 seconds and then turn on the camera, this creates a surge of power which is necessary to initiate the connection with the Macintosh.

An alternate to the Olympus software is a shareware package called CamerAid which can be downloaded from the internet.

These are only suggestions, if further assistance is required contact Olympus tech support at 1-888-55-DIGITAL (1-888-553-4448).

Note: This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content and mention of this product should not be interpreted as a recommendation by Apple. Please contact the vendor for additional information.

Published Date: Feb 20, 2012

iMac: Changing Internet Settings and Applications

I went through Internet Setup Assistant and entered all my information. I can connect to the internet just fine, but I would like to use Netscape Navigator rather than Microsoft Internet Explorer as my default browser.
This article has been archived and is no longer updated by Apple.
There are two applications that determine the way your computer accesses the internet, Internet Setup Assistant and Internet Config.

Internet Setup Assistant
If you need to change your internet service provider (ISP) configuration details, you can use the Internet Setup Assistant located under the Apple Menu in the Internet sub-menu. This application automates the process of entering details such as: connection protocol, service name, domain name server address, router (gateway) address and other details.

Most of this information is stored in the TCP/IP control panel preferences as configuration information. You can make a backup of your configuration by opening the TCP/IP control panel, choosing the Configurations option under the File menu, selecting your active configuration and clicking the "export" button. This will save your configuration to a file that can later be imported, without the need to re-enter all your information.

Internet Config
General internet configuration information, such as the default browser, default homepage, helper applications and other settings may be changed using Internet Config application. Internet Config is located in the path: Macintosh HD: Internet: Internet Utilities: Internet Config.

The iMac uses Microsoft Internet Explorer as the default browser, but this setting may be changed using Internet Config. Other settings that determine how your computer routes information may also be changed in Internet Config. Some of the more common settings are:

- Email - email Address, email Account, email Password, SMTP Host, email Headers
- File Mappings - Extension (i.e. .html) to Application
- Helpers - Document type (i.e. sound file) to Application
- News - NNTP Host, News Username, News Password
- World Wide Web - Home Page

You can make a backup of these settings using the "Save As" option under the Internet Config File Menu. This backup of your Internet Preferences can later be retrieved without the need to re-enter all your information.

iMac and Mac OS 9: No Sound or Startup Chime Heard

This article describes a situation where no audio is heard from an iMac. Nothing is plugged into the sound out ports.
This article has been archived and is no longer updated by Apple.

Symptom:

At startup, no chime is heard, nor are any beep sounds or other audio sources.

Products affected:

iMac, Mac OS 9

Solution:

- Verify the system volume setting in the Sound portion of the Monitors & Sound control panel is not muted. The start-up chime on the iMac is controlled through software sound controls, allowing the volume of the startup chime to be adjusted.
- Verify the audio cable is properly connected if a RAM upgrade was recently performed. Following the RAM install directions in the Mac OS Info Center, look at Step 10 for a diagram depicting the audio cable.
- If the cable is connected correctly, you may consider having the computer inspected by an Apple-authorized service provider.

Mac OS: Help Center Missing From Help Menu

The Help Center and Mac Help may not appear in the Help menu if the Apple Guide extension is not installed or turned off, or if there is not enough memory installed in the computer.
This article has been archived and is no longer updated by Apple.

Symptom

Help Center and Mac Help are not available from the Help menu.

Solution

1. Make sure the Apple Guide extension is installed in the Extensions folder, or is turned on in the Extensions Manager control panel.
2. Make sure the computer has enough memory to load the Apple Guide extension. Even if the Apple Guide extension is installed it may not load if there is not enough memory installed in the computer. This may be the case if you start up the computer from a CD-ROM disc with virtual memory turned off.

iMac: Hole in I/O Door Not For Cables

I routed all of my cables through the hole in the I/O door on my iMac, but it is hard to open because there is not enough room for my finger. Should the cables not be routed through the hole?

This article has been archived and is no longer updated by Apple.

As pictured in step 5 of the tri-fold "Welcome to your iMac" pamphlet, the cables should be routed through the large gaps at the bottom of the I/O door. The large hole provides the only convenient means of opening the I/O door. Routing cables through the hole may also cause them to become disconnected when the I/O door is opened.

The iMac (Slot Loading) does not have a door over the I/O ports so this is not an issue.

Mac OS Setup Assistant: Desired Printer Not Displayed in List

I am using the Mac OS Setup Assistant to configure Mac OS for a network printer but it does not see the printer. The printer is in a different zone than my computer.

This article has been archived and is no longer updated by Apple.

Mac OS Setup Assistant which shipped with Mac OS 8.5, 8.5.1, and 8.6 may not list or allow you to select and configure the network printer you expected or have previously used. The Mac OS Setup Assistant only lists those network printers that reside in the same zone that your Macintosh resides in. If you wish to select a printer other than what is listed by Mac OS Setup Assistant you can:

1. Select one of the other printers as a temporary measure via the Mac OS Setup Assistant, then select your printer of choice in the zone of choice through the Chooser once you have completed the Setup Assistant. You may also select the printer with the Desktop Printer Utility that ships with Mac OS 8.5.

- **Note:** The Desktop Printer Utility, v1.0, that shipped with LaserWriter 8.5.1 only allowed you to choose a printer that resides in the same zone as does your Macintosh.

2. Quit Mac OS Setup Assistant, change the zone your Macintosh resides in, restart Mac OS Setup Assistant, then respond to the Mac OS Setup Assistant's questions including selecting the printer of choice.

- This assumes that you have different zones available to register in on the network cable segment your Macintosh is connected to (this is a different concept that zones listed in the Chooser).

- To view the different zones your Macintosh can register in, open the AppleTalk Control Panel. The available zones you may register your Macintosh in will display in the "Current zone" scroll bar.

Published Date: Feb 20, 2012

Mac OS Help: Required Extensions

When trying to run Mac OS Help, I have gotten the following error messages at different times:

"Help Viewer requires QuickTime 3.0 in order to run."

- and -

"Help Viewer requires AppleScript in order to run."

I have also found that Help Center and Mac OS Help are not available from the help menu.
This article has been archived and is no longer updated by Apple.
The Help Viewer application uses both AppleScript and QuickTime and will not launch if those technologies are not installed or functioning. Both the QuickTime extension and the QuickTime Power Plug extension are required for QuickTime to work. Both the AppleScript extension and the AppleScriptLib extension are required for AppleScript to work.

If the Apple Guide extension does not load, there will be no option for "Help Center" or "Mac OS Help" under the Help menu.

Extensions can fail to load if they're missing, damaged or if there is insufficient memory available to the system software. If you use the Mac OS 8.5 CD to start up a Power Macintosh with less than 24 MB of physical RAM, there is not enough RAM to for Apple Guide to load.
Published Date: Feb 20, 2012

Mac OS: Application Switcher Overview

This article discusses the Application Switcher, available with Mac OS 8.5 and Mac OS 9.

This article has been archived and is no longer updated by Apple.
The Application Switcher displays a list of running applications in a floating palette window called a miniwindow, similar to the application menu shown in the top right corner of the menu bar prior to Mac OS 8.5.

To open the Application Switcher miniwindow, drag all the way to the bottom of the Application menu, then drag beyond the menu. When the outline of a window appears, release the mouse button. The Application Switcher is now running. Click an icon in the Application Switcher miniwindow to bring that application to the foreground.

You can also use the Application Switcher to open documents by dragging a document icon onto the icon of an application in the Application Switcher miniwindow.

Application Switcher supports AppleScript to configure its appearance.

The Application Switcher can be anchored to a corner of your screen, show large or small icons, hide or show the application name, have a horizontal or vertical orientation, as well as other controls.

For a complete description of using the Application Switcher, see the Mac OS Help.

Mac OS 8.5: What's New?

What are the major changes in Mac OS 8.5?

This article has been archived and is no longer updated by Apple.

IMPROVED PERFORMANCE AND STABILITY

Faster copying over the network and to disks

Improved copying performance now lets you copy files over a network faster than ever. Copying to hard disks and removable disks such as Zip disks and CDs is also improved.

AppleScript improvements

With improvements in AppleScript, scripts can run up to three to five times faster. More control panels and tasks are scriptable; for example, you can now automate networking tasks.

You can also attach a script to a folder and launch the script by performing actions such as opening the folder or copying a file to it.

QuickDraw improvements

Improvements in QuickDraw graphics and text reduce the time it takes to display images on your screen and let you scroll faster.

Disk protection

You can now test and repair your startup disk or volume using Disk First Aid. If your computer is shut down improperly, Disk First Aid automatically checks your startup disk for problems when you restart.

INCREASED INTERNET INTEGRATION

Easy browsing of file servers

The new Network Browser lets you easily find and connect to AppleShare servers on a network. You can also use the Network Browser to create a list of favorite servers and quickly connect to these servers.

Quick Internet searches

The Search Internet section of the Find program now lets you quickly search the Internet using your choice of search engines. Each item in your search results is ranked by relevance and includes the item's URL and a summary. You can also link to the item directly from the search results window.

New multilingual capabilities

You can now display multilingual content in browsers and other Internet applications. This means you can view international Web sites using either Microsoft Internet Explorer or Netscape NavigatorTM.

Access to network time servers

The Date & Time control panel now lets you connect to a network time server so that your files always bear an accurate date and time. You can also have daylight-saving time set for you automatically. To get ready for the year 2000, set the date format to show the century.

Easy ways to manage Internet settings

The new Internet control panel lets you enter Internet preferences, such as your e-mail address, your default news server, the address of your default home page, and your default Web browser, in one central location that can be accessed by all your Internet-based applications. It also lets you create groups of Internet settings and quickly switch between them.

Internet location files

You can create files that point to locations on the Internet or on local area networks. For example, you can create a file that points to a web site, an AppleShare server, or an e-mail address. When you double-click an Internet location file, your favorite networking application takes you to a location on the Internet or local network, or opens a new e-mail message.

You create an Internet location file by dragging text that contains an Internet address (such as http://www.apple.com) into a Finder window or onto the desktop.

IMPROVED WINDOW NAVIGATION AND MANAGEMENT

New appearance features

- Title bar icon Resize columns
- Proportional scroll boxes Double scroll arrows

With new appearance features, you can

- use icons in the title bar of a folder or volume window to move or copy the folder or volume and all its contents
- change the width and order of columns
- tell how much of a window's content is visible by looking at proportional scroll boxes (The more space the scroll box fills in the scroll bar, the more content is visible.)
- scroll the contents of a window more easily using double scroll arrows
- smooth the appearance of text by turning on anti-aliasing

All the settings for customizing the look and feel of your computer's desktop are now located in the Appearance control panel. You use this control panel to set all system fonts, the background pattern or picture, and the new scrolling and anti-aliasing options. After you select your favorite settings, you can save them as a group of appearance settings.

Standard view options

In the Views section of the Finder Preferences window, you can specify a standard set of options for list, button, or icon views. The standard view options are automatically applied to every window, unless you've customized the window's view options.

New icon features

The icons of files (including applications, disks, and folders) now change appearance when you alter the files in certain ways.

Improved File and Program Management

New content searching for files

The "Find by Content" section of the Find program now lets you search the contents of files for one or more words. Before you can search the contents of a disk's files, you must create an index of the disk. If you have modified files on a disk since it was last indexed and you want to search the modified content, you need to update the index. It can take a while to create an index, so you may want to schedule a time when you're away from your computer to automatically create and update indexes.

New ways to switch between programs

You can "tear off" the Application menu and display it as a small window (called the "Application Switcher"). You can display the contents of the Application Switcher window in list view or icon view. You can use the Application Switcher to easily switch between open programs.

To display the Application Switcher drag all the way to the bottom of the Application menu, then drag beyond the menu. When an outline of a window appears, release the mouse button.

New ways to open and save files

Many application programs now provide Open and Save dialog boxes that give you more options when you're opening and saving documents. These dialog boxes let you

- open several files at once by holding down the Shift key as you select the files
- open and save documents on AppleShare servers on your network using the Shortcuts button
- connect to unmounted AppleShare servers using the Shortcuts button
- add the names of zones, servers, volumes, and folders that you use frequently to a list of favorite items using the Favorites button
- choose from a list of recently opened or saved documents using the Recent button

Easy access to favorite items

The Favorites folder in the Apple menu gives you convenient access to the documents, applications, zones, servers, volumes, and Internet locations you use most frequently. Favorite items are also available in the Network Browser and in the new Open, Save, and Choose dialog boxes.

The Favorites folder is marked with a red ribbon.

Intelligent onscreen help

Apple Help, the new onscreen help system you're using now, lets you search for and display information, connect to help sites on the Internet, and click links that automatically open files and do tasks.

Enhanced Info windows

Info windows for files now include pop-up menus that let you

- adjust the amount of memory assigned to an application program or desktop printer
- set file sharing options for an application, folder, or volume
- see if a printer is busy and how the printer is configured
- see which fonts are available for use with a printer

Media Integration

QuickTime capabilities

Apple's QuickTime technology lets you work with files in a variety of multimedia formats. QuickTime 3.0 offers the best in video, music, and voice compression technologies and lets you use your Web browser to automatically play movies at the highest quality setting possible for your computer and your Internet connection.

QuickTime VR lets you work with "virtual reality" movies. You can rotate objects, zoom in or out, look in any direction, and navigate from one scene to another. QuickDraw 3D allows you to manipulate three-dimensional graphics.

Built-in document translation

You can open most files on your computer by double-clicking their icons. When you try to open a document that was created in an application you don't have, your computer automatically identifies the file type of the document and tries to open it in an application you do have. Your computer also recognizes the most common types of DOS and Windows files and uses preassigned applications to open the files.

You can change the assigned applications or add new ones using the File Exchange control panel.

Better color matching

ColorSync is a color management system that ensures the colors you see on your monitor closely match the colors you print or scan. In Mac OS 8.5, you use the Monitor Calibration Assistant in the Monitors & Sound control panel to adjust your system for accurate color reproduction.

Text-to-speech capabilities

You can have your computer speak the alert messages that appear on the screen. You set your computer to speak alert messages using the Talking Alerts section of the Speech control panel by checking the "Speak the alert text" checkbox. Mac OS 8.5 by default has Speak the Alert Text set to on. In some application programs that support this feature, your computer can also read text contained in documents aloud.

Mac OS 8.5: Starting Up From Mac OS 8.5 CD

How do I start up my Power Macintosh from the Mac OS 8.5 CD?
This article has been archived and is no longer updated by Apple.
Before installing Mac OS 8.5, you should start up your computer using the Mac OS 8.5 CD. This ensures that any incompatible extensions on your computer will not cause issues during installation. To start up your computer from the CD:

1. Insert the Mac OS 8.5 CD into the CD-ROM drive.
2. Shut down your computer.
3. Hold down the C key on your keyboard while turning on your computer. Keep holding the C key until you see the "Welcome to Mac OS" message.

Note: PowerBook 1400 systems require that you hold down the Command-Option-Shift-Delete keys together to boot from a CD.
Published Date: Feb 20, 2012

Mac OS 8.5: System Requirements for Install and Use

What are the system requirements of Mac OS 8.5?
This article has been archived and is no longer updated by Apple.
In order to install and run Mac OS 8.5, you will need the following system configuration:

- One of the following Mac OS-based Apple computers with a PowerPC processor:
- iMac
- Power Macintosh G3
- Any Power Macintosh, PowerBook, or Workgroup Server computer with a 4-digit model number.
    - Mac OS 8.5 may not function with a Mac OS 8.5 compatible Apple Power Macintosh computer that has been upgraded with a non-Apple processor upgrade card. Please check with the card's manufacturer for compatibility information.
    - Computers upgraded with Apple's Power Macintosh 233-MHz Processor Upgrade Kit are supported.
    - The Power Macintosh Upgrade Card (supported in the Quadra 700), the Macintosh Processor Upgrade (supported in the 575), and all 680X0 processors are NOT supported with Mac OS 8.5.
- 150 MB to 250 MB of free disk space
- 16 MB of physical RAM, with virtual memory (VM) set to at least 24 MB
- The minimum amount of RAM will let the computer perform only at minimum performance. Installing additional RAM will increase the system performance.

With VM turned off there may be up to a 10 MB difference in RAM usage. This difference is normal and due to the decreased RAM requirements of the system software when VM is on (due to code-mapping).

Mac OS 8.5: Function of Installer

What are the functions of the Mac OS Installer?
This article has been archived and is no longer updated by Apple.
The Mac OS Install application, located on the software install CD, lets you install Mac OS 8.5 (or specific components) on your computer. It offers better installation performance with the ability to combine multiple software installations together into a single install process. Additionally, you can specify custom install options (at the beginning of the install process) within a single install. Customized removal of software can also be performed with the Install application.

You can save and load software installation sets, test and repair hard disk directory damage, update Apple hard disk drivers, and create an install report log listing the date, time, name, and location of all software installed.

Mac OS 8.5: What is Automatic Disk Repair?

This article discusses automatic disk repair.
This article has been archived and is no longer updated by Apple.
When the computer crashes or is shut down improperly, data corruption or disk directory errors may occur. The General Controls control panel option to warn when an improper shutdown has occurred will now test and repair startup volume disk directory automatically on restart from a crash or improper shutdown. To enable this feature, select the checkbox "Warn me if computer was shut down improperly" in the General Controls control panel.

On startup after a crash or improper shutdown, a message appears indicating that the startup disk is being checked by Disk First Aid. A progress bar will show the status of the disk directory repair, and when finished, display the results.

Automatic disk directory repair only repairs the startup volume. Additional disk volumes are not tested and repaired automatically. To test and/or repair these volumes, use the Disk First Aid utility located in the Utilities folder.

Published Date: Feb 20, 2012

Mac OS 8.5: Find By Content Pre-Requisites

What has to be done before Find by Content can be used for the first time?
This article has been archived and is no longer updated by Apple.
The Find by Content section of Sherlock lets you search the contents of files on your local volumes for one or more key words. Find By Content works by searching for key words contained within the text of each of the files. After indexing your files, you can search for information contained within the file without first having to open the file. This makes finding information contained within multiple files quick and easy.

Note: Find by Content and Search Internet requires QuickTime 3.

To access Find By Content, click its tab in the Sherlock window. You must index your hard disk volumes before you can search the contents of the files. Server volumes cannot be indexed. The Find button will remain disabled (gray) until indexing has been completed.

To begin indexing your volumes, click the Index Volumes button, select its name in the Index Volumes window, then click the Create Index button.

Click the Create button to begin indexing the volume. An Indexing Progress window will show the current status of the indexing. Depending on the number of files contained on the volume, indexing may take a significant amount of time to complete. Note that, for optimum performance and disk space usage, only the first 2000 unique terms of each document are indexed.

You can specify a schedule to be used for indexing volumes at a later time when you're away from your computer. The schedule also allows for periodic indexing to keep the index up to date. To set the indexing schedule, click the Schedule button

Select start time and the days of the week to perform automatic indexing, then click the OK button.

NOTE: You will need to select the "Use Schedule" check box for each volume you want to use automatic indexing.

After indexing is complete, you can enter keywords for information you want to find within the contents of files in the Find by Content window, then click the Find button. For example, typing the key word "Macintosh" might display a list of the following files that contain this word:

Search results are sorted by relevancy and can be sorted by name, kind, or size by clicking the column heading name. To open a file, double-click its name in the list.

To find files that are similar in content to a file in the search results list, first select the file, then click the Find Similar Files button. The contents of the file you selected will be used to search for other files with similar contents.

To summarize the contents of a file to the clipboard, hold down the Control key while clicking on the file name in the search results list. Select Summarize to Clipboard from the contextual menu that appears. The contents of the file will be summarized and displayed in the Finder's clipboard window:

Note: The Summarize to Clipboard feature works only on files whose type is TEXT.
Published Date: Feb 20, 2012

Mac OS 8.5: How Search the Internet Saves Time

How does Search the Internet save time when searching web servers?
This article has been archived and is no longer updated by Apple.
The Search Internet section of Sherlock provides the ability to quickly search the Internet using your choice of popular search engines. Additional Internet search sites can be easily added by dropping their files onto the System Folder. Search site files go into the Internet Search Sites folder.

Find by Content and Search Internet requires QuickTime 3.

The Search Internet feature is the fastest and easiest way to search Internet search engines since you search multiple sites with a single search.

To access the Search Internet section, click its tab in the Sherlock window. To perform an Internet search, type the keywords for the information you want in the Words field. Select the checkbox for each Internet search engines to use for the search, then click the Search button. For example, typing "PowerBook 1400 and memory" would perform a search on the selected Internet search sites for these keywords. The results of the search are presented in a window, ranked by relevance:

To sort the search results by Name or by Site, click the column heading. To view a summary of a link in the list, click its name. A short summary of the link is presented in the window below the search results. To open the link with your web browser software, click the link name in the summary window.

Internet search site files may be periodically updated for changes in search engines or to take advantage of newer features. When performing an Internet search with a search source file, an automatic check is performed to determine if an updated search source is available. If such an update is available, a window will appear:

To accept the update, click the Update button. You can also manually check for updates by selecting the Update Search Sites command in the Find menu.

Mac OS 8.5: What is Contained in Internet Control Panel?

What kinds of information goes into the Internet control panel?
This article has been archived and is no longer updated by Apple.
The new Internet control panel lets you enter Internet preferences, such as your e-mail address, your default news server, the address of your default home page, and your default Web browser, in one central location that can be accessed by all your Internet-based applications. It also lets you create groups of Internet settings that can be quickly switched between.

Settings in the Internet Control Panel are only functional for third-party applications that are designed to support Internet Config. Changing information in the Internet Control Panel may change similar information in one or more applications. Not all applications will use all of the information settings. See the documentation for each application for details.

Mac OS 8.5: What Email Information is Contained in Internet Control Panel?

What kinds of e-mail related information goes into the Internet control panel?
This article has been archived and is no longer updated by Apple.
The E-mail section is where your user name, password, mail servers and some common e-mail application settings are entered.

All information except the application settings must come from your Internet Service Provider (ISP) or your network administrator such as your account ID, Incoming Mail Server, password, Outgoing Mail Server, how you wish to be alerted to an incoming email, and your default email application.

Mac OS 8.5: No Disk Tools Diskette Included

Is there a Disk Tools disk available with Mac OS 8.5? If so, where?

This article has been archived and is no longer updated by Apple.
A Disk Tools disk is a floppy disk with a minimal system folder, Disk First Aid and Drive Setup. If your hard drive and CD drive aren't working, you can start up your computer with this disk to troubleshoot further. Also, some third-party disk-repair utilities or virus-protection programs may ask you to modify a copy of your disk tools disk to use their software.

No physical Disk Tools diskette is included with Mac OS 8.5, if you need one however, you can make one from the image included with Mac OS 8.5. To make a disk tools disk, double-click on the "Make Disk Tools floppies" DiskScript. It will walk you through making a Disk Tools disk from a blank, high-density floppy disk:

The Disk Tools floppy you make can serve as an emergency startup and utility disk, should you be unable to start up from the Mac OS 8.5 CD. The Disk Tools disk contains Drive Setup and Disk First Aid to aid you in your troubleshooting and disk formatting needs.

Mac OS 8.5: New Finder Window Features

Are there any new Finder window features in Mac OS 8.5?
This article has been archived and is no longer updated by Apple.
The Finder in Mac OS 8.5 has a number of enhanced features and performance improvements. The following list highlights many of these improvements:

List View

- Resizable and reorderable list views
- List views for each window are resizable. To resize a list column, place the mouse pointer in between the column headings until it changes to the resize cursor, then click and drag the column to the desired size.
- List view column headings can be reordered for each window. To reorder the column headings, click and drag the column heading to the left or right of another heading, then release the mouse button (NOTE: The name column cannot be reordered).
- New option in the Appearance control panel for "smart scrolling" adds proportional scroll boxes and double scroll arrows.

Icon View

- For a window with active scroll bars, doing a Command-Drag by clicking on any background area of the window allows the window to be scrolled in either direction. Scrolling in both the horizontal and vertical directions can be done simultaneously this way.

Mac OS 8.5: Function of Tabs in Preferences

What are the functions of the tabs in the Preferences window of the Finder's Edit menu?
This article has been archived and is no longer updated by Apple.
The Finder Preferences panel, located in the Finder's Edit Menu, consolidates many global Finder settings into a single interface. To access each group of settings, click its tab in the window.

General - Provides settings for enabling Simple Finder menus and commands, spring-loaded folders, and grid spacing.

Views - Provides global settings for each window view type (List, Icons, and Buttons).

Labels - Allows you to specify the color and name of each label that can be assigned to files and folders.

Mac OS 8.5: Title Bar Icon Features

What are the features of the title bar icons in the Finder?
This article has been archived and is no longer updated by Apple.
The window title bar now includes the folder icon next to its name. This icon can be used just as any folder icon can be used, without having to first switch to an icon view setting. For example, to create an alias of a folder, click on the folder icon and drag it to the desktop while pressing the Option and Command keys.

You can also copy folders between volumes, duplicate folders, and move folders between folders by using the title bar icon. The title bar icon can also be useful for quickly identifying the folder you are working with.

Mac OS 8.5: How to Fix Broken Aliases

This article discusses how to repair broken aliases.

This article has been archived and is no longer updated by Apple.
A new feature in Mac OS 8.5 lets you locate the file when an alias to it can no longer find the file. When opening an alias to a file that cannot be located, a message now appears with options:

Clicking OK will dismiss the message and leave the alias file as is.

Clicking the Delete Alias button will move the alias file to the Trash.

Clicking Fix Alias button opens a dialog box which allows you to locate the file and select it for use by the alias file. Once you have located the file, click the Choose button:

An alternate method to repair a broken alias is to select Get Info from the File menu and choose "Select New Original" from the General Information pane (see enhanced Get Info windows below).

Mac OS 8.5: Components and Features of Navigation Services Window

What are the components and features of a Navigation Services window?
This article has been archived and is no longer updated by Apple.
Mac OS 8.5 offers a new Navigation Services capability to the Finder and other applications. These services provide enhanced open and save dialog boxes that give you more options when opening and saving documents:

Original Open File Dialog Box:

Figure 1 Original Open File Dialog Box

New Navigation Services Open File Dialog Box:

Figure 2 New Navigation Services Open File Dialog Box

The Navigation Service file dialogs are NOT automatically used in all applications. Applications must be first rewritten to use the Navigation Services. Customers desiring Navigation Services in a third-party application should contact its developer to request this feature.

Mac OS 8.5 makes use of Navigation Services in the Network Browser, the Appearance and File Exchange control panels, and to fix broken aliases.

These new dialog boxes allow you to:

- View files in the dialog box similar to the Finder with disclosure triangles, sorting by name or by date, and in ascending or descending order.
- Display a file preview or thumbnail image.
- Depending on the application, you can switch to other applications while the dialog box is open.
- Resize the dialog box
- Open several files at once by holding down the Shift key as you select files. You can also select multiple files by holding down the Command key as you click. Note that some applications may only allow you to select one file at a time.
- You can drag and drop items into the dialog box. For example, in the Desktop Pictures open/save dialog box, dragging a folder to the dialog box will make that folder's contents appear in the dialog window. New Shortcuts, Favorites, and Recent Items buttons.
- Connect to unmounted AppleShare servers and open and save documents using the Shortcuts button.
  Note: The Connect to Server option mounts only AppleShare IP File Servers with a TCP/IP connection.
- Add the names of zones, servers, volumes, and folders that you use frequently to a list of favorite items using the Favorites button.
- Choose from a list of recently opened or saved documents using the Recent button.

For more information on the Shortcuts, Favorites, and Recent buttons, select Balloon Help from the Help menu and move the mouse pointer to each button.

Published Date: Feb 20, 2012

Mac OS 8.5: Appearance Control Panel Settings

What settings are available in the Appearance control panel?
This article has been archived and is no longer updated by Apple.
The Appearance control panel has been updated to provide additional features and controls for Appearance Manager 1.1. Each feature is accessible through one of six tabs in the Appearance window: Themes, Appearance, Fonts, Desktop, Sound, and Options.

Themes - the Themes tab provides the ability to configure the desktop appearance as a group of settings called a Theme. Selecting a theme will automatically adjust your system font, appearance, sound, desktop pictures and patterns, and options to the specified settings.

You can use the predefined Themes included with Mac OS 8.5, or create a custom Theme. To create a custom Theme, after selecting your appearance settings, click the Save Theme button. A window appears allowing you to name the Theme. After saving the Theme, to use its Appearance settings, click on your Theme in the Themes section of the Appearance control panel.

Appearance - the Appearance tab allows you to select a set of Appearance settings and specify highlight colors and color variations for menus and controls.

Appearance - this provides the overall look of menus, icons, windows, and controls. Use the Appearance pop-up menu to select an Appearance type. Mac OS 8.5 includes "Apple platinum" appearance. In the future, other appearances from Apple and other companies can be added by dropping its Appearance file into the System Folder.

Highlight Color - use this pop-up menu to select a color to be used when highlighting text.

Variation - use this pop-up menu to select color variations to be used when displaying menus and controls.

Fonts - the Fonts tab allows you to choose a font to be used for System menus, headings, text, labels, lists, and icons.

Large System Font - use this pop-up menu to select a font to be used when displaying system menus and headings. Mac OS 8.5 includes seven fonts to choose from: Charcoal, Chicago, Chisel, Textile, Techno, Capitals, and Sand. Additional fonts added to the Fonts folder in the System Folder are not available in this selection.

Small System Font - use this pop-up menu to select a font to be used when displaying explanatory text and labels. Mac OS 8.5 currently allows only the Geneva font to be selected.

Views Font - use this pop-up menu to select a font to be used with lists and Finder icons. Any font installed in the Fonts folder of the System Folder can be selected. Select the font point size to use through the size pop-up menu or type the size in the window.

NOTE: 9 point is the minimum that can be selected.

Smooth all fonts on screen - selecting this option enables anti-aliasing for all fonts displayed on the screen. Select the font smoothing minimum size through the Size pop-up menu or type the size in the window (NOTE: 12 point is the minimum that can be selected).

Desktop - the Desktop tab allows you to select a pattern or picture to be displayed on the Finder desktop.
Patterns - To select a pattern, click a pattern name in the window, then click Set Desktop.

Many patterns available in the Desktop section will not display correctly at monitor bit depths of 256 colors or less. In order to view the full effect of a pattern, select thousands or millions of colors.

If a desktop picture has already been selected, it will cover the pattern in the preview panel and the message "The pattern may be covered by the picture" is displayed. Click the Remove Picture button first, then the Set Desktop button to display the pattern.

Pictures - To select a Desktop picture, click the Place Picture button. You can select a picture file in graphics formats such as PICT, GIF, and JPEG. Click the Show Preview button to see a smaller (thumbnail) image of the selected file. Select the picture file you wish to use, then click the Open button. Once you have selected a picture, click the Set Desktop button.

Sound - the Sound tab allows you to select a set of sound effects to be used when actions take place.
Sound Track - choose a Sound track from the Sound track pop-up menu. Mac OS 8.5 includes the "Platinum Sounds" sound track.

Play sound effects for - select which sets of actions you wish to have sound effects. To enable or disable an action, click its checkbox.

Options - the Options tab allows you to specify settings for scroll arrows, scroll boxes, and window collapse.

Smart Scrolling - selecting this option will place two arrows on either end of a scroll bar and adds proportional scroll bar thumbs.

TA25751_Mac_OS_Appearance_Control_Panel_Settings.pdf

Double-click title bar to collapse windows - selecting this option will allow you to collapse windows by double-clicking the title bar of the window, similarly to clicking the collapse window icon.

Published Date: Feb 20, 2012

Mac OS: Key Commands for Application Switcher

This article describes the key commands for manipulating the Application Switcher, accessible through the application menu in the upper right-hand corner of the menu bar. Application Switcher is available with Mac OS 8.5, 8.6, and Mac OS 9.
This article has been archived and is no longer updated by Apple.
The Application menu, available in Mac OS 8.5, 8.6, and 9, can be viewed in a number of different formats. The name of the active application now appears next to its icon in the menu making it easy to determine which application is currently active. In addition, the application menu can be "torn off" and appear on the desktop as a floating window (miniwindow) displaying all applications running on the system:

- The Application Switcher miniwindow can be used to select or activate any program running on the system by simply clicking its name or icon in the Application Switcher miniwindow. You can also use the keyboard shortcut Command-Tab to switch between programs or use Command-Shift-Tab to switch between programs in reverse order. To change the keys used for this shortcut, see the link "Help me modify the keyboard shortcuts" in the Switching between open programs section in Mac OS Help.

  Options for the Application Switcher can be accessed by using the keyboard and mouse. Additionally, many functions can be scripted using AppleScript:

- **Hide Application** To hide an application, hold down the Option Key while clicking on a different application in the miniwindow.
- **Collapse the miniwindow** Click the collapse box in the upper right corner of the miniwindow (Note: available only while displaying in vertical orientation).
- **Resize the Application Switcher miniwindow** To resize the miniwindow, move the pointer to the edge of the right side of the miniwindow until the pointer changes, then click and drag the miniwindow to the desired size.
- **Open document** Drag and drop the document onto the compatible application name in the Application Switcher miniwindow.
- **Hide/Show application name** Click the zoom box to hide and show the application names.
- **Toggle between small and large icons** Hold down the Option Key while clicking the zoom box.
- **Toggle between vertical and horizontal orientation** Hold the Option and Shift keys down together while clicking the zoom box.

Note: Some features of the Application Switcher are available only via AppleScript. See Mac OS Help for more details on using AppleScripts with Application Switcher.

Mac OS 8.5: Date and Time Control Panel Features

This article has been archived and is no longer updated by Apple.

What are the features of the Date and Time control panel?

The Date & Time 8.1 control panel now provides an option for automatic Daylight Saving Time switching as well as the ability to use a network time server to synchronize the Macintosh clock.

Select Show Balloons in the Help menu to get more information about each section of the Date & Time control panel.

Automatic Daylight-Saving Time
Click the Set Time Zone button to choose the nearest city in your time zone.
Enter the current date and time in the Current Date and Current Time windows.
Click the Set Daylight Saving Time Automatically checkbox in the Date & Time control panel. The Macintosh clock will automatically be adjusted for Daylight Saving Time.

Network Time Server
Check the Use a Network Time Server checkbox.
Click the Server Options button.
Select a Network Time Server from the pop-up menu.

Select an option for automatic, timed, or manual time updating. Note that if you select manual, you will not receive a notification that the connection was successful until you click OK and note the last synchronization time in the window.

Click the Set Time Now button to connect to the Network Time Server and set the Macintosh clock. You must have an active TCP/IP connection to the Internet to in order to connect to a network time server. If you are not connected to the Internet, the error message "Unable to set the time. Make sure TCP/IP is set up correctly and try again" will appear when attempting to set the time. Note that the error message can be misleading. If your computer is not connected to the Internet, the problem is that you cannot connect to a Network Time Server when not connected to the Internet.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

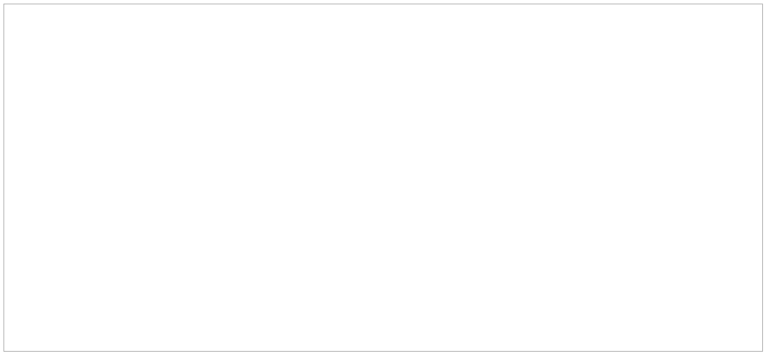
Mac OS 8.5: Energy Saver Control Panel Features

What are the features of the Energy Saver control panel?
This article has been archived and is no longer updated by Apple.
The Energy Saver 2.1 control panel now consolidates the functionality of the PowerBook, PowerBook Setup, and Auto Remounter control panels into the Energy Saver control panel. When opening the Energy Saver control for the first time, the following message is displayed:



This message will be displayed each time the Energy Saver control panel is opened until you specify settings. To change the Energy Saver settings, click the Specify Settings button. The Energy Saver settings window opens with a different interface depending if you are using a Desktop computer or a PowerBook computer.

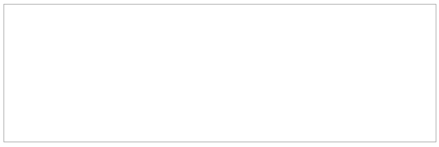
Desktop computer

PowerBook computer - Idle Sleep settings

PowerBook computer - Advanced Settings

NOTE: The Reduce processor speed option shown above is available for PowerBook G3 computers only.

The Energy Saver control strip module (PowerBook computers only) allows you to quickly switch between better conservation and performance settings, put the PowerBook into sleep mode, and open the Energy Saver control panel:



NOTE: Energy Saver is not compatible with or installed on NuBus-based Power Macintosh computers, such as the Power Mac 5200, 5300, 6100, 6200, 6300, 7100, or 8100.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Published Date: Feb 20, 2012

Mac OS: File Exchange Control Panel Features

This article describes the features of the File Exchange control panel, which was introduced with Mac OS 8.5.
This article has been archived and is no longer updated by Apple.
The File Exchange 3.0 control panel unites Mac OS Easy Open and PC Exchange capabilities into a single control panel. The control panel is divided into two sections: PC Exchange and File Translation. To access each section, click its tab in the File Exchange control panel.

Choose Show Balloons in the Help menu to get more information about each section of the File Exchange control panel.

- PC Exchange - the PC Exchange section provides the ability to open files from PC DOS disks with Macintosh applications, as shown below:

- Map PC Extension to Mac OS file types on PC disks - turn on this option to automatically map PC files to Mac OS file types based on its PC extension. If this option is not turned on, PC files will be treated as generic text files.
- Open unmapped files on any disk using mappings below - turn on this option to open unmapped files on any disk with the file mappings listed in the window (NOTE: QuickTime Exchange, located in the QuickTime Settings, maps media files before this option takes effect).
- PC SCSI Disks - turn on this option to automatically mount a PC SCSI disk when you start up the computer. If this option is turned off, you can click the Mount Now button to mount the PC SCSI disk after startup.
- Mappings - to add a PC file mapping, click the Add button. The Add Mapping window opens:

Type the .extension type in the Extension field, then select an application to map the file to. If you can't find the application in the application list, click the Select button to choose an application. Use the File Type pop-up menu to select the file type. To view the advanced options, click Show Advanced Options. When you have entered all of the information, click Add.

To remove a file mapping, select the mapping in the window, then click Remove. To edit a file mapping's settings, select it in the window, then click Change.
The PC Exchange section for File Exchange 3.0 cannot be used to identify SCSI ID numbers or drive ROMs and firmware revisions, as was available in previous versions of PC Exchange. This information is now available in Apple System Profiler 2.1.

- File Translation - the File Translation section of File Exchange allows you to specify settings for translating files from one file type to another.

NOTE: Previous versions of Mac OS included MacLinkPlus translation software from DataViz. This software provided software translation capabilities similar to File Exchanage and is no longer included with Mac OS 8.5.

- Translate documents automatically - turn on this option to enable automatic translation of documents when opened from the Finder or from dialog boxes.
- Always show choices when translating files - turn on this option to show the available choices when translating files instead of using the default translations.
- Don't show choices if there's only one - turn on this option to limit showing of available choices to more than one.
- Include applications on servers in translation choices - turn on this option to search connected server volumes for application choices. NOTE: selecting this option delays the display of translation choices.
- Translation Preferences - the file type and application to be translated to is shown in this window (see below). To add a translation preference, click Add:

Select the file type that you want to add a translation for, then click Continue . A list of available applications to translate the file to is displayed. Select the application you want to translate the file to, then click OK. To remove a translation preference setting, select it in the window, then click Remove.

For additional information on how to use this feature, click Help or open the Help Center (from the Help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, control panels and applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Mac OS 8.5: Sherlock Features

What are the features of the Sherlock application?
This article has been archived and is no longer updated by Apple.

The Find File application, previously located in the Apple menu, has been expanded and renamed Sherlock in Mac OS 8.5. It includes two additional features: Find By Content and Search Internet. In addition, Sherlock allows you to save search settings into a settings file which can be used to quickly perform searches.

Find File - The Find File section lets you search local disks and connected file server volumes for files by file name or by many other file attributes:

Figure 1, Sherlock Find File feature

To select the volume to be searched, use the Find Items pulldown menu. Use the pulldown menus to select volume to be searched, the file attribute type and search arguments. For additional search options, click the More Choices button. After specifying your search criteria, click the Find button. The results of the search are shown in a separate window. Click the name of the file to view the location on the volume in the window below the search results.

Double-click on a file name to open it. To move or copy the file, click and drag its icon from the search results window to the Finder desktop, volume, or folder location, and release the mouse button.

Find By Content - The Find by Content section of Sherlock lets you search the contents of files on your local volumes for one or more key words. Find By Content works by searching for key words contained within the text of each of the files. After indexing your files, you can search for information contained within the file without first having to open the file. This makes finding information contained within multiple files quick and easy.

Find by Content and Search Internet requires QuickTime 3.

To access Find By Content, click its tab in the Sherlock window:

Figure 2, Sherlock Find by Content feature

You must index your hard disk volumes before you can search the contents of the files. Server volumes cannot be indexed. The Find button will remain disabled (gray) until indexing has been completed. Depending on the number of files contained on the volume, indexing may take a significant amount of time to complete. Note that, for optimum performance and disk space usage, only the first 2000 unique terms of each document are indexed. To learn more about that limit, see technical document 106986, "**Mac OS: Find By Content Index Limited to 2000 Unique Terms**".

After indexing is complete, you can enter keywords for information you want to find within the contents of files in the Find by Content window, then click the Find button. Search results are sorted by relevancy and can be sorted by name, kind, or size by clicking the column heading name. To open a file, double-click its name in the list.

To find files that are similar in content to a file in the search results list, first select the file, then click the Find Similar Files button. The contents of the file you selected will be used to search for other files with similar contents.

To summarize the contents of a file to the clipboard, hold down the Control key while clicking on the file name in the search results list. Select Summarize to Clipboard from the contextual menu that appears. The contents of the file will be summarized and displayed in the Finder's clipboard window:

Note: The Summarize to Clipboard feature works only on files whose type is TEXT.

Search Internet - the Search Internet section of Sherlock provides the ability to quickly search the Internet using your choice of popular search engines. Additional Internet search sites can be easily added by dropping their files onto the System Folder. Search site files go into the Internet Search Sites folder.

Find by Content and Search Internet requires QuickTime 3.

The Search Internet feature is the fastest and easiest way to search Internet search engines since you search multiple sites with a single search.

To access the Search Internet section, click its tab in the Sherlock window:

Figure 3, Sherlock Search Internet feature

To perform an Internet search, type the keywords for the information you want in the Words field. Select the checkbox for each Internet search engines to use for the search, then click the Search button. For example, typing "PowerBook 1400 and memory" would perform a search on the selected Internet search sites for these keywords. The results of the search are presented in a window, ranked by relevance.

To sort the search results by Name or by Site, click the column heading.

To view a summary of a link in the list, click its name. A short summary of the link is presented in the window below the search results.

To open the link with your web browser software, click the link name in the summary window.

Internet search site files may be periodically updated for changes in search engines or to take advantage of newer features. When performing an Internet search with a search source file, an automatic check is performed to determine if an updated search source is available. If such an update is available, a window will appear:

Figure 4, Updated Search Sites Available window.

To accept the update, click the Update button. You can also manually check for updates by selecting the Update Search Sites command in the Find menu.

Save Search Criteria - After you have specified the search criteria for Find File, Find by Content, or Search Internet, you can save the search as a file. This file can be opened later to automatically perform the search. To save search criteria, select Save Search Criteria in the File menu. Enter the name and location to save the search criteria, then click the Save button. The search criteria is saved in a file and appears in the location you specified.

Sherlock Preferences - The Preferences allows you specify options to be used with the Sherlock application. The access the Preferences, select Preferences from the Edit menu:

Figure 5, Sherlock Preferences

Show current search status for Find File - selecting this option provides the search status in the Find File window.

Indexing options - select the Don't index items with this label to have the index ignore all folders and files using that label. NOTE: Be certain that all items you wish to have indexed on the hard disk are set to use a label other than the one you select.

System Responsiveness while indexing - if you choose to work with the computer while indexing files, you may find the system performance to be slow. In this case, adjust this setting to the More Responsive setting to help improve system performance.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Mac OS 8.5: Internet Control Panel Features

This article explains the features of the Internet control panel.
This article has been archived and is no longer updated by Apple.
The new Internet control panel lets you enter Internet preferences, such as your e-mail address, your default news server, the address of your default home page, and your default Web browser, in one central location that can be accessed by all your Internet-based applications. It also lets you create groups of Internet settings that can be quickly switched between.

Settings in the Internet Control Panel are only functional for third-party applications that are designed to support Internet Config. Changing information in the Internet Control Panel may change similar information in one or more applications. Not all applications will use all of the information settings. See the documentation for each application for details.

To access the Internet control panel, select Internet in the Control Panels folder. When first using the Internet control panel, the default Internet setting is named "untitled". To rename this set, select Rename Set from the File menu:

Figure 1, Rename Set window.

Type a new name for the set and click the Rename button.

To add a new set, select New Set from the File menu. Type the name for the set, then click the Save button.

To switch between active sets, select the set from the pull-down menu:

Figure 2, My Settings pull-down menu of Internet control panel.

There are five sections of settings within a set: Personal, E-Mail, Web, News, and Advanced. To begin editing these settings, click the disclosure triangle next to Edit Sets:

Figure 3, Personal settings.

For help with editing information, select Balloon Help from the Help menu. Move the mouse pointer to each section for an explanation of the type of information you can enter or edit.

Personal - The personal section is where you enter information about yourself that will be used by Internet applications to identify you to other users. When you click the Edit Sets disclosure triangle, the following window is displayed:

E-mail - The E-mail section is where your user name, password, mail servers and some common e-mail application settings are entered. All information except the application settings must come from your Internet Service Provider (ISP) or your network administrator:

Figure 4, Email settings.

Web - The Web section is where you enter some common web browser settings:

Figure 5, Web settings.

News - The News section is where you enter information used to access a news server. This information is used by your news reader application to retrieve news groups and postings:

Figure 6, News settings.

Advanced - The Advanced section allows you to enter more advanced settings. To access the Advanced settings, select User Mode from the Edit menu, then selected the Advanced setting. The Advanced section tab appears:

Figure 7, Advanced settings.

The Advanced section contains settings for File Transfer (FTP), Helper Apps, Fonts, File Mapping, Firewalls, Messages, and Hosts. For help with changing the Advanced settings, select Balloon Help from the Help menu and move the mouse pointer over each section.

After you have completed editing settings for a set, select Save Settings from the File menu.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Apple Help Features

What are the features of Apple Help? How do you navigate in Apple Help?
This article has been archived and is no longer updated by Apple.
Apple Help, new with Mac OS 8.5, is an on-screen help system that lets you search for and display information about Mac OS and its associated technologies like AppleScript. Apple Help includes the Help Viewer application which reads HTML-based help files, connects to other help sites on the Internet, and provides links that automatically open files and perform tasks. Apple Help can be enhanced with custom help files and, since it's searchable and its files are stored on the hard disk, it's the fastest and easiest way to locate information about Mac OS.

Apple Help requires QuickTime 3.

To open Apple Help, select Help Center from the Help menu. The following window opens:

You can quickly access Apple Help for specific topic by using an item's contextual menu. To do this, hold down the Control key while clicking on the item, and select Help from the contextual menu that appears.

The Help Center window displays the available help files. Mac OS 8.5 includes AppleScript Help and Mac OS Help. To view Mac OS Help, click its link in the Help Center window:

To view information about a topic, click its name in the left column. Additional information about that topic appears in the right column of the window. Click the information you want to view and it appears within the Help Viewer window.

The Previous and Next page buttons at the top left side of the window allow you to navigate the help viewer information. Clicking the Home button opens the Help Center and displays the available help information.

To search for a particular topic, type the topic or keywords in the search field at the top of the window. For example, if you wanted to get more information about accessing the Internet, you could type "How do I access the Internet?" and click the Search button. After a few moments, a list of search results appears sorted by relevancy:

Apple Help can assist you in performing the tasks described in the topic information. Where you see the words "Open the <item> for me," you can click the link to have Apple Help open the file. Likewise, where you see the words "Help me...", you can click the link to have Apple Help assist you step-by-step through the task described. For example, clicking the link "Show me how to configure my TCP/IP settings" opens the Apple Guide with instructions on how to perform the task:

Published Date: Feb 20, 2012

Mac OS 8.5: Network Browser Features

What are the features of the Network Browser application?
This article has been archived and is no longer updated by Apple.
The new Network Browser lets you easily find and connect to AppleShare servers on an AppleTalk network. You can also use the Network Browser to create a list of favorite servers and quickly connect to these servers.

To open the Network Browser, select Network Browser from the Apple menu. The Network Browser window opens showing a list of the network zones available:

Figure 1, Network Browser window.

Depending on the network you are connected to, the lists of available zones may not appear as shown. If you are connected to a network that does not have a network router, you may not see any zones listed. You will only see the devices connected to your computer's AppleTalk connection.

To access file servers in the Network Browser, double-click on the zone icon or click the zone's disclosure triangle. Click the disclosure triangle for the file server you want to see a list of volumes available. The file server's sign-in dialog appears allowing you to connect to the server. Then click the volume icon that you wish to open from the list:

Figure 2, Selecting a volume icon.

The Network Browser window has five buttons at the top part of the window: Shortcuts, Favorites, Recent, Previous, and Next:

Figure 3, Network Browser window buttons

Shortcuts - Connect to your AppleTalk network or to an AppleShare IP file server:

Figure 4, Network Browser shortcuts options

Selecting Connect to Server opens a window allowing you to specify the address of the AppleShare IP file server.

Favorites - Add the names of zones, servers, and volumes that you use frequently to a list of favorite items using the Favorites button:

Figure 5, Network Browser Favorites options

Recent - Choose from a list of AppleShare volumes you have recently visited:

Figure 6, Network Browser Recent options

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Mac OS 8.5: Memory Control Panel Features

What is new about the memory control panel?
This article has been archived and is no longer updated by Apple.
Memory control panel

Select Show Balloons in the Help menu to get more information about each section of the Memory control panel.

Disk Cache - in the default setting, disk cache memory is calculated automatically when the computer starts up to provide optimum application performance. The Disk Cache size changes depending on the amount of RAM installed in the computer and allocated to a RAM disk, if any.

You can use a custom disk cache setting when your computer task requires a finely tuned Disk Cache setting. To select a custom disk cache setting, click the Custom setting button. The following message is displayed:

Raising the disk cache setting above the optimum level may decrease system performance. In most cases, this setting will not need to be changed and should only be changed when specific recommendations have been given by the software or hardware product developer. Apple does not have specific recommendations about custom settings.

Click the Custom button to proceed. Be certain that any Disk Cache setting you choose is appropriate for the amount of memory installed in your computer. If you find that you do not have enough memory to launch applications, you may need to lower this setting. After entering the custom Disk Cache settings, you will need to restart the computer for the new settings to take effect.

Startup Memory Tests - In cases where there is a significant delay in starting up the computer, disabling the startup memory tests may help.

NOTE: This option is normally hidden until you press and hold the Command and Option keys while opening the Memory control panel. The startup memory tests are designed to ensure that the memory is fully functional in the computer. You should disable the startup memory tests only if you are experiencing a long delay in starting up the computer.

Mac OS 8.5: Multilingual Internet Access Features

What does are the features of Multilingual Internet Access?
This article has been archived and is no longer updated by Apple.
Multilingual Internet Access provides the software you need in Mac OS 8.5 to display text from one or more of the following language families: Roman, Arabic, Devanagari, Gujarati, Gurmukhi, Hebrew, Japanese, Korean, Simplified Chinese, and Traditional Chinese, using any WorldScriptTM-aware application. Multilingual Internet Access also allows text editing for the following language families: Roman, Arabic, Devanagari, Gujarati, Gurmukhi, and Hebrew.

Installing Multilingual Internet Access

You can only install Multilingual Internet Access on Mac OS 8.5. You may add Multilingual Internet Access to a clean install by clicking Customize in the Mac OS 8.5 installer and selecting the desired options, or you may add Multilingual Internet Access to an existing Mac OS 8.5 system.

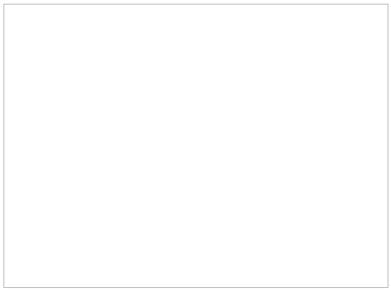
The Customized Installation option for Multilingual Internet Access offers five more language packages than the Recommended Installation option, and you may install the language packages of your choice. However, you will not be offered a language package that is the same as the primary language of your Mac OS system.

Recommended Installation - The Recommended Installation will install the software needed to display text in Japanese, Korean, Simplified Chinese, and Traditional Chinese.

Customized Removal - The Customized Removal allows you to remove language support individually. For the language support you wish to remove, it deletes the related fonts from the Fonts folder. However, it will not remove WorldScript I or WorldScript II, nor will it remove script resources. If you use applications that are not compatible with WorldScript, you might want to temporarily disable the WorldScript extensions by using Extensions Manager or by manually removing them from the Extensions folder and restarting your computer.

The Keyboard Menu

After installing Multilingual Internet Access, you will see the Keyboard Menu next to the Application menu:



The Keyboard Menu allows you to switch from one keyboard language to another. Select the language that corresponds to the language of the keyboard you are using. Select Customize Menu to open the Keyboard control panel.

Browsing Web Sites

Using your web browser, you can view web sites in different language encodings:

NOTE - The title bar does not display readable characters unless you have the appropriate language kit installed. This is normal.

To switch between different language character sets, select the language through the browser's menu:

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Mac OS 8.5: Unicode Support

What parts of Mac OS 8.5 include Unicode support?

This article has been archived and is no longer updated by Apple.
Unicode is an international industry standard used to encode written characters. It's a double byte universal character coding scheme that supports all modern day writing systems and has been accepted as an ISO standard. This standard makes it possible to encode all of the characters used for written languages throughout the world in one table.

Mac OS 8.5 better supports Unicode keyboard and text services with the following enhancements:

KeyCaps 8.0.2

- Modification of the Key Caps Application to Support Unicode Keyboard Layouts

Keyboard 8.1

- Provides support for a change to Font and Keyboard Script Synchronization. Keyboard Control Panel version 8.1 will also provide support for Unicode.

QuickDrawText/Font Manager

- Add anti-aliased (smooth) text
- Fixed bugs and thus improved stability
- Improve performance, especially for 2-byte fonts. 2-byte fonts are character fonts such as Chinese, Japanese, Korean, Hebrew, and Arabic fonts.
- Moved WorldScript II patch into system to improve stability, performance, and memory requirements of 2-byte systems.
- Now possible to draw double-byte text without WorldScript II, so CJK systems work when booted with extensions off.

Text Services Manager 1.5

- Support for one-byte scripts used in emerging markets such as Thailand and India. Input methods for languages other than Japanese, Korean, and Chinese can now be added.
- Support for Unicode input including Unicode keyboard layouts and Unicode input methods. Enabling Unicode input support is a key requirement for ATSUI.
- Addition of event protocol support requested by AppleTech for the Kotoeri input method and by other developers. This protocol will pave the way for text services such as spell checkers, tokenizers and stemmers, which need to analyze words contextually.
- Integration of inline support, which is currently provided by a collection of software patches. This will improve reliability.
- These features will provide significant user experience improvements for the markets which require single-byte input methods and will add value specifically for publishing because it will support text entry in Thai, Indic languages, etc.

Apple Type Solution for Unicode Imaging (ATSUI)

- ATSUI is a new application programming interface (API) that lets applications draw Unicode text and provides advanced typography in a QuickDraw graphics environment. ATSUI will also provide DataFork Font Support.

Published Date: Feb 20, 2012

Mac OS 8.5: AppleScript 1.3 Features

What are the features of AppleScript 1.3? Where in the Mac OS is there more info about AppleScript?
This article has been archived and is no longer updated by Apple.
AppleScript 1.3 provides the following improved performance and usability features:

Performance and Usability

- Native PowerPC code - AppleScript has been completely rewritten in native PowerPC code. As a result, scripts can now run as much as five times faster (depending on the task being scripted).
- Dictionaries - The dictionaries for the Finder, many other system software components, and the Mac OS scripting additions (Standard Additions file) have been consolidated, cleaned up and organized. Items have been organized by functional groups, making it easier to understand a component's scriptable functionality.
- Scripts folder - The new Scripts folder inside the System Folder provides a central, stable location for your scripts. AppleScripts dropped onto the System Folder are automatically placed in this folder:

- The Folder Action Scripts folder inside the Scripts folder contains the folder actions scripts included with the Mac OS.

New scriptable system software components - The following system software components are now scriptable:

- Control panels - Appearance, Apple Menu Options, File Exchange, Location Manager
- Extensions - Application Switcher, ColorSync Extension
- Applications - Apple Help Viewer, Apple System Profiler, Desktop Printer Manager, Disk First Aid, Find, Network Setup Scripting

New scripting additions and features - Most Apple-supplied scripting additions (file type "osax") are now unified into one file, the Standard Additions file. Scripting additions expand the capabilities of AppleScript, providing additional commands that you can use in your scripts. The Standard Additions file includes these new features: Using the Clipboard, Pausing a script, Displaying lists, Mounting remote volumes, Speaking text, Summarizing text, and Timed dialog boxes.

Unit types - You can now convert data expressed as units of measure - including length, weight, volume, area, and temperature - between different measurement systems.

Internet suite - For advanced scripters, AppleScript 1.3 includes standard-event terminology for processing Common Gateway Interface (CGI) requests from an HTML form. (A CGI is a helper application for server software that processes the information sent from an HTML form.) Previously, the only way to write AppleScript CGIs scripts was to use the raw Apple event codes. The new suite provides the appropriate terminology.

Folder Actions - Folder actions allow you to run AppleScripts when you interact with a folder in any of the following ways: Open a folder, Close a folder, Add items to an open folder, Remove items from an open folder, and Move or resize a folder window.

By using folder actions, you can make tasks you do frequently take place automatically. For example, you can specify that when a file is placed in a folder, it's always copied into another folder as well. If a folder has folder actions attached to it, the folder's icon displays a small script icon badge:

To assign a folder action to a folder, press and hold the control key while clicking on the folder. Select Attach a Folder Script from the contextual menu that appears.

Mac OS 8.5: Remote Access 3.1 Features

What are the features of Remote Access 3.1?
This article has been archived and is no longer updated by Apple.
Apple Remote Access 3.1 client software replaces Open Transport PPP in Mac OS 8.5. Note that the Open Transport PPP control panel and extensions will be removed upon installing Mac OS 8.5. The capabilities provided through the PPP Control Panel are now provided through the Remote Access control panel.

In addition, Apple Remote Access 3.1 includes Remote Access Status, available in the Apple menu. Remote Access Status allows you to access the connection settings established in the Remote Access control panel, as well as view the current status of the connection. For more details on Apple Remote Access 3.1, see the Apple Remote Access 3.1 Read Me.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Published Date: Feb 20, 2012

Mac OS 8.5: Open Transport 2.0 Features

What are the features of Open Transport 2.0?
This article has been archived and is no longer updated by Apple.
The new features of Open Transport include:

- Implementation of the Dynamic Host Configuration Protocol (DHCP) will be improved to support a number of requested features, including Client Identification, retention of the lease on a given IP address across boots, improvement of user feedback in the event that the DHCP server is unavailable, display of the time remaining on a lease, allowing the user to "re-lease" an address, support of RFC 2131, and provision of an API to allow third-party-developers to access DHCP fields unused by Open Transport.
- Support for the Simple Network Management Protocol (SNMP). SNMP allows network managers to administer services, configure devices, and monitor usage on complex, multivendor networks. Apple has selected the Simple Network Management Protocol (SNMP) to meet this customer requirement. SNMP is an industry-standard protocol for network management defined by the Internet Engineering Task Force (IETF).
- Program-to-Program Communications, and particularly AppleEvents, which to date have been available only over AppleTalk protocols, supported over TCP/IP.
- Multilink multihoming, the capability of running several network interfaces simultaneously with potentially several network addresses on each interface, is implemented for TCP/IP protocols. Note that this capability requires software to take advantage of it (such as a web server or other server software).
- Apple Remote Access 3.1 replaces OT/PPP as part of the system release.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Published Date: Feb 20, 2012

Mac OS 8.5: PlainTalk 1.5.3 Features

What are the features of PlainTalk 1.5.3?
This article has been archived and is no longer updated by Apple.
PlainTalk is a collection of software components that enables Macintosh computers to respond to spoken commands and speak written text. PlainTalk makes use of two enabling technologies: Speech Recognition and Text to Speech.

Speech Recognition
The Speech Recognition (SR) aspect of PlainTalk is a continuous-speech system that allows you to simply speak commands to the computer without exaggerated diction or volume. Those commands are executed as if you had used the mouse or keyboard for input. PlainTalk SR is dialect independent, requiring no adjustment for changes from user to user.

Speech Recognition gives you the ability to streamline operations by simply invoking commands by speaking their names. Writing speech commands is accomplished through two different methods:

AppleEvent enabled applications can use commands written with AppleScript. Non-AppleEvent enabled applications can use commands built by using a macro utility like QuickKeys from CE Software.

Text to Speech
The Text to Speech (TTS) aspect of PlainTalk gives the computer the ability to read text-based information aloud via speech synthesis through the computer's speaker. Multiple voices at various sound quality levels are supported through the use of Macintalk system extensions.

Text to Speech enables new capabilities such as audible proofreading or, in combination with the telephony capabilities that GeoPort provides, listening to computer recitation of your E-mail messages from remote locations.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.
Published Date: Feb 20, 2012

Mac OS 8.5: Disk First Aid Features

What are the features of Disk First Aid 8.5.1?
This article has been archived and is no longer updated by Apple.
You can now test and repair your startup disk or volume using Disk First Aid 8.5.1 without first starting up from a different volume. In addition, Disk First Aid 8.5.1 provides the following enhancements:

- Automatically tests and repairs the startup volume on startup after an improper shutdown or crash occurs.
- Verifies and repairs many kinds of damage caused by use of older disk utilities that are not compatible with Mac OS Extended (HFS Plus) volumes.
- Supports AppleScript for verify and/or repair a volume.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Mac OS 8.5: Drive Setup 1.6 Features

What are the features of Drive Setup 1.6?
This article has been archived and is no longer updated by Apple.
The Drive Setup utility provides drive initialization, driver update, and testing services for Apple hard drives. Drive Setup 1.6 provides the following enhancements:

- Drive Setup can now reinitialize a drive maintaining the former partition scheme and formats
- Warns the user before updating a newer driver with an older driver.

For additional information on how to use this feature, click the Help button or open the Help Center (from the help menu) and type the name of the feature. Balloon Help can also answer questions about window contents, window controls and menu items in the Finder, Control Panels and Applications, where supported. To turn on Balloon Help, choose "Balloon Help" from the Help menu in the Finder.

Network Assistant 4.0: Error Loading the ACD1.DRVR Driver with FaxSTF Installed

I was installing the Apple Network Administrator Toolkit on an iMac and I got the following error message upon restart:

"The STFInit system extension had an error loading the ACD1.DRVR driver file. Please make sure it is in the Drivers folder of your STF folder."

Can you help?
This article has been archived and is no longer updated by Apple.
There appears to be a conflict between Apple Network Administrator Toolkit or Apple Network Assistant and the FaxSTF software.

To resolve the situation, follow these steps to move the Network Assistant Startup extension from the Extensions folder to the root level of the System Folder:

1. Open the System Folder.
2. Open the Extensions folder. Both folders should now be open and their windows visible.
3. Drag the file named "Network Assistant Startup" from the Extensions folder to the System Folder's opened window.
4. Restart your computer.

The error message should be gone and Network Assistant will continue to function normally.

iMac: Changing Default Home Page Using Internet Config

When I launch my web browser, it tries to open a web page which is no longer available. How can I change the default page which my browser accesses?

This article has been archived and is no longer updated by Apple.

The iMac comes preconfigured to use Internet Config which contains default settings for the internet applications pre-installed on your iMac. To modify the default home page for your browser, open Internet Config and select World Wide Web. You can then change the default home page to the page of your choice.

Also, you can change the default home page from within your browser application by unchecking "Use Internet Config" in the Preferences section.

Published Date: Feb 20, 2012

iMac: Modifying Logic Board Voids Warranty

Various iMac web pages refer to or describe modifications to the iMac logic board to support an external display or other non-iMac compatible external peripherals. What impact would these modifications have on my warranty?
This article has been archived and is no longer updated by Apple.
Apple, Inc. does not support modification to the iMac logic board other than for approved upgrades such as memory.

Modification of your iMac logic board, or any other Apple board, voids the Apple Limited Product Warranty for that board. Accordingly, you can expect your service provider to charge you for service to that board, if it requires service after modification.

Mac OS 8.5: What Is SNMP?

I notice that Mac OS 8.5 includes a component called SNMP. What is it, and what can I do with it?
This article has been archived and is no longer updated by Apple.
This article discusses the following questions about OT/SNMP:

- What is SNMP?
- How would I use SNMP?
- What do I need to get started with SNMP? (system requirements; third-party software needed)
- Known issues
- Where can I get more information?

What is SNMP?

SNMP (Simple Network Management Protocol) was originally developed by the Internet Engineering Task Force to manage large TCP/IP networks containing hardware from different vendors. SNMP has since been broadened to run independently of any network protocol, and is now a standard for managing devices on a multi-vendor network.
SNMP is a network management system that consists of SNMP management software running on a computer called a **console**, and SNMP **agent** software installed on each network computer. The agents installed on a networked computer collect management information-called **variables** -from the computer and relay this information to the management console.

The variables that can be managed by an SNMP agent are defined in a database called a **MIB** (Management Information Base). A MIB specifies what each variable does and whether it can be modified. Within a MIB, variables may be organized into **tables** (collections of variables) and groups. For example, a hardware group describes the physical parts of the computer, such as the expansion cards in the computer and the type of SCSI (Small Computer System Interface) devices connected to the computer. An interface table (iftable) group would contain information about the network interfaces on a machine, hardware addresses (when applicable), network speed, and status.

The administrative relationship between a console and one or more networked computers is called a **community**. A community is identified by a unique name, which authenticates a console as a valid member of the community. Once a console is authenticated, each managed computer must then determine the type of **access privileges** (read/write, read only, or no access) the console has to the variables on that computer. This collection of variable access privileges is called the **community view**.

Mac OS 8.5 includes the agent side of SNMP network management system (custom install required), allowing the Macintosh computers to be managed by a third-party console. Included with the Mac OS 8.5 customer install is the SNMP Administrator, which runs on each networked Macintosh, and collects a variety of information from the individual SNMP agents and relays this information to the console.

The SNMP Administrator program can be used to import or export a community, and to change access privileges to the data in the MIBs being collected.

How would I use SNMP?
SNMP is often used to manage large, multi-vendor environments. Data from network entities can be collected and analyzed to provide insight for troubleshooting and network management. A network administrator might use SNMP to gather routing tables and traffic statistics on routers or bridges. They could also set up traps, i.e., configure the console so that a specific event (such as a server going down) would set off an alarm (alerts sound, e-mail, a page).

From a Macintosh agent, the network administrator could gather information about the system software, the hardware, the TCP/IP connections, and the AppleTalk connections. SNMP is a very powerful tool, but it would require a good deal of knowledge about networking to be able to interpret some of the information it returns.

What do I need to get started with SNMP?
To use SNMP on your network, you would need SNMP agent software on your workstations (OT/SNMP for your Macs), a third-party SNMP console, and network connectivity between them.

Installing OT/SNMP
Included with Mac OS 8.5 is the installer for the SNMP Agent software, which includes some extensions and the SNMP Administrator application. This software can be installed by doing a custom install, selecting the Mac OS component to custom install, and then again doing a custom install (rather than the default "recommended installation") of the Mac OS. When you select a custom install of the Mac OS, go under "Networking" and select SNMP.

Additional note: When using OT/SNMP, you must set TCP/IP to initialize at system startup time. To do so, go into the TCP/IP control panel, go into "Advanced" mode (Command-U), select "Options" and Deselect "Load only when needed." Then restart the workstation.

System Requirements:
The OT/SNMP software requires:

- Mac OS version 7.5.5 or greater
- OT 1.1.1 or greater; OT 2.0 or newer required for AppleTalk MIB II access
- A minimum of 16 MB of RAM
- 8 MB of available disk space.
- 68030 or greater
- CFM 68K required on 680x0 computers

SNMP Console
You'll also need some sort of console--SNMP Management software--that will collect, display and help you analyze the data that are collected. SNMP Management Software can run on a variety of platforms, but there are a few available for the Macintosh.

Dartware, LLC has a demo version of its InterMapper SNMP console that monitors network equipment and alerts managers to problems on the product's web site: http://www.dartware.com/intermapper/

Dartware also has a SNMP query tool called SNMP Watcher posted at their web site: http://www.dartware.com/snmpwatcher/

Neon Software also offers a product called LANsurveyor and has a demo version available on their web site:
http://www.neon.com/

To locate other third-party software developers who offer SNMP Management Software do an Internet search or search the Macintosh Products Guide at http://guide.apple.com/ .

Known Issues
The TCP/IP stack must be initialized at system startup time for the SNMP agent software to load on a computer. Use the "Options" button in the TCP/IP control panel (visible when in "Advanced" mode) to Deselect the "Load only when needed" option.

OT/SNMP replaces earlier versions of SNMP agent software for the Mac, called MacSNMP, which shipped as a component of "AppleTalk Connection Kit for the Macintosh" and "TCP/IP Connection Kit for the Macintosh." Extensions and applications using the MacSNMP APIs are not supported and must be revised to use OT/SNMP APIs.

Where Can I Get More Information?
Details about the SNMP specification and the MIB's are found in RFC's (Request for Comments).
Some RFC's related to SNMP include:

- RFC 1213, "Management Information Base for Network Management of TCP/IP-based internets: MIB-II"
- RFC 1243, "AppleTalk Management Information Base"
- RFC 1643, "Definitions of Managed Objects for the Ethernet-like Interface Types"
- SNMP Version 1 Specification
- RFC 1155, "Structure and Identification of Management Information for TCP/IP-based Internets"
- RFC 1157, "A Simple Network Management Protocol (SNMP)", RFC 1157.

See the following article for additional 3rd party SNMP software:
Tech Info Library Article 9780: "**Neon Software, Inc.**"

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

The following Tech Info Library article can help you search for a particular vendor's address and phone number:

Mac OS 8.5: About Mac OS 8.5 Read Me

The following is the About Mac OS 8.5 Read Me:

Notes About Mac OS 8.5

- AppleScript and Mac OS 8.5
-
- Creating Desktop printers for Non-AppleTalk Printers
-
- Monitor Resolution changes after Mac OS 8.5 install
-
- Slow screen redrawing
- Unusual or inconsistent appearance

Notes About Compatibility

- America Online (AOL) Customers
- Anti-Aliased Text and Mac OS 8.5
- Apple CD-ROM extension and non-Apple CD-ROM incompatibilities
- Apple HD SC Setup program
- Apple language kits and Mac OS 8.5
- Applications that install QuickTime
- At Ease and Mac OS 8.5
- Command-Tab shortcut and Third Party Applications
- Connectix Virtual PC and Mac OS 8.5
- Desktop Printer Extension and Mac OS 8.5
- Dr. Solomon's Virex and Mac OS 8.5
- Iomega 6.0.1 driver and Virtual Memory
- FM Radio application and Appearance sounds
- Some programs refuse to open

Notes About Internet Access

- International Internet access

Notes About PowerBook Computers

- Password Security protects one partition only
- PowerBook 3400/G3 Modem

Notes About Printing

- Reinstalling printer drivers
- Switching between a LocalTalk network and a serial printer

Miscellaneous Notes

- Drive Setup and Energy Saver
- QuickTake 150 software installs old version of QuickTime PowerPlug extension
- QuickTake Image Access
- Using Acrobat PDF documents
- Using Monitors & Sound with add-on devices

This article has been archived and is no longer updated by Apple.

About Mac OS 8.5

This document provides information about Mac OS 8.5 that supplements the information in your installation manual and on-line help. For up-to-date news and compatibility information, please see the Mac OS Late-Breaking News web site at **http://www.apple.com/macos/latebreaking/**

Notes About Mac OS 8.5

*** AppleScript and Mac OS 8.5**

Mac OS 8.5 incorporates many new scriptable features and changes the behavior of some existing features. These changes may require some scripts to be updated.

*** Creating Desktop printers for Non-AppleTalk Printers**

Use the Desktop Printer Utility to create Desktop printers for non-AppleTalk Printer such as Infrared and LPR (TCP/IP). Double click on the utility, select the printer type and the correct PPD file for the printer by clicking on the change button. For LPR printers, you need to provide the Domain name or IP address as well as the Queue name of the printer or server. Close the dialog to save and create the desktop printer.

*** Monitor Resolution changes after Mac OS 8.5 install**

After performing a clean install of Mac OS 8.5, your monitor resolution may have changed from its previous settings. You can change your monitor resolution back by using the Monitors & Sound control panel.

*** Slow screen redrawing**
If a desktop picture is redrawn slowly after closing a window, your computer might be running low on memory. Set the Appearance control panel to display a pattern, instead of a picture, to speed up the redrawing process.

*** Unusual or inconsistent appearance**
Some applications may exhibit unusual or inconsistent cosmetic anomalies when used with Mac OS 8.5. These should not impact the performance of the application. Contact the manufacturer of the program to see if an updated version of the program is available.

Notes About Compatibility

*** America Online (AOL) Customers**
To enjoy QuickTime content on the web while using America Online, simply drag a copy of the file "QuickTime plugin" into the AOL Plug-ins folder (located in the same folder as the AOL application) and relaunch AOL.

*** Anti-Aliased Text and Mac OS 8.5**
If you turn on "Smooth all fonts on screen" in the Appearance control panel, you may notice some visual anomalies in some applications. This might include problems in the appearance of highlighted text (particularly when your highlight color is black), text that switches back and forth between smoothed and unsmoothed, or text that is not drawn correctly in front of a colored background. Contact your application vendor for updates to address these problems. You can reduce the anomalies in highlighting by choosing a light highlight color.
The width of text on the screen may be different when smoothing is turned on, which may cause line breaks in your documents to change.

*** Apple CD-ROM extension and non-Apple CD-ROM incompatibilities**
If your computer or CD-ROM drive is not manufactured by Apple, or you have an Apple CD-ROM drive and you use a non-Apple driver, incompatibilities may result. For your CD-ROM drive to function correctly, remove the file named *Apple CD / DVD* from the Extensions folder, and reinstall the third party software which supports your CD-ROM drive. Please contact the developer of the third party software to see if you have the latest version.

*** Apple HD SC Setup program**
After you install Mac OS 8.5, you cannot use the obsolete Apple HD SC Setup program to initialize your Apple hard drive. Use the Drive Setup program supplied with Mac OS 8.5 instead.

*** Apple language kits and Mac OS 8.5**
Apple's language kits require an updater for full functionality with Mac OS 8.5. If you have language kits installed on an older system you are updating, or if you install a language kit after installing Mac OS 8.5, be sure to run the Language Kit Updater, located in the CD Extras folder.

*** Applications that install QuickTime**
Some applications replace the version of QuickTime installed by Mac OS 8.5 with an earlier version when they are installed. This will cause problems with other parts of the system that require features of the newer version of QuickTime. If this occurs, you will need to re-install QuickTime from the Mac OS 8.5 CD by selecting "Add/Replace" in the installer, and then doing a custom install.

*** At Ease and Mac OS 8.5**
Some of the Mac OS 8.5 control panels can't be enabled for At Ease users and won't appear in At Ease Setup. You should use these control panels in the Finder before running At Ease. Also, note that At Ease does not support file sharing. Do not turn on file sharing when using At Ease or your computer may freeze.

*** Command-Tab shortcut and Third Party Applications**
The keyboard shortcuts to switch back and forth between applications are Command-Tab and Command-Shift-Tab. These shortcuts may conflict with some third party applications. An assistant for changing this keyboard shortcut can be found in the on-line Mac OS Help within the "Files and Programs" chapter, under "Switching between open programs."

*** Connectix Virtual PC and Mac OS 8.5**
Connectix Virtual PC 2.0 and 2.0.1 are not compatible with Mac OS 8.5 and users should update to version 2.1 or later. The 2.1 updater is available as a free download for all Virtual PC 2.0 owners on the Connectix web site: **http://www.connectix.com/html/updates.html**.
Connectix Virtual PC 1.x users should upgrade to version 2.1 or later for Mac OS 8.5 compatibility.

*** Desktop Printer Extension and Mac OS 8.5**
The Desktop Printer Extension file is incompatible with Mac OS 8.5. It may cause your computer to freeze when starting up. Restart with the shift key held down and remove the file from the Extensions folder, then restart. See Figure 1.

Figure 1 Desktop Printer Extension file.

*** Dr. Solomon's Virex and Mac OS 8.5**
Dr. Solomon's Virex versions 5.8.1 and earlier are not compatible with Mac OS 8.5 if the Virex "Scan Files When Opened" option is turned on.

For more information on upgrading to Virex 5.9, contact McAfee, the publisher of the software at http://software.mcafee.com/

*** Iomega 6.0.1 driver and Virtual Memory**
Mac OS 8.5 includes support for the use of removable media (like the Iomega Jaz drive) for Virtual Memory; however, the currently shipping version of the Iomega driver included with this release does not support the use of an Iomega drive for Virtual Memory. A new driver, Iomega driver version 6.0.2, is under development and will support this new feature. The 6.0.2 driver should be available for free download at **http://www.iomega.com** in September 1998.

If you wish to install Mac OS 8.5 onto a Zip or Jaz disk, you should change the backing volume used by Virtual Memory to a non-removeable volume. To do this, disable extensions while restarting the first time by holding down the shift key. Open the Memory control panel and turn on Virtual Memory. The Memory control panel will let you set the VM backing volume to a volume that is compatible with VM.

*** FM Radio application and Appearance sounds**
You may find that launching the FM Radio application after turning on Appearance Sounds disables sound. This can be remedied by turning off Appearance Sounds before launching the FM Radio application and turning them back on after the application is running.

***Some programs refuse to open**
A small number of application programs will not open if the system font is not set to Chicago. Use the Appearance control panel and change the large system font to Chicago then open the program again. Contact the manufacturer of the program to see if an updated version is available.

Some programs may require additional memory when used with Mac OS 8.5. If a program will not open, select the program's icon, choose Get Info from the File menu and increase its minimum memory allocation by 300K. See the Memory topic in Mac OS Help for more information.

Notes About Internet Access

*** International Internet access**
If you don't already have an account with an Internet service provider, you can obtain one using the Internet Setup Assistant, or you can choose one from the list in the International Internet Access file in the Internet Extras folder on the Mac OS 8.5 CD. Read this information before using the Internet Setup Assistant.

Notes About PowerBook Computers

*** Password Security protects one partition only**
The Password Security control panel asks for a password in order to start up the computer. If you have formatted your internal hard disk so it has more than one partition, only the startup partition will be password-protected. Additionally, if more than one partition has a System Folder, the PowerBook may start up from a non-protected partition.

*** PowerBook 3400/G3 Modem**
To function properly, ethernet on the PowerBook 3400 and PowerBook G3 (but not the G3 Series), requires the PowerBook 3400/G3 Modem extension.This extension is installed by the Mac OS 8.5 installer and should not be removed, even if other modem software is installed. Removing this extension will prevent you from making ethernet connections.

Notes About Printing

*** Reinstalling printer drivers**
If you perform a clean installation of Mac OS 8.5, and an icon for your printer is not available in the Chooser, you may need to reinstall the software that came with your printer. If you have a StyleWriter, StyleWriter II, or StyleWriter 1200, you can use the StyleWriter 1500 driver that comes with Mac OS 8.5 instead of installing your original printer software. If you have a Color StyleWriter 2200 or Color StyleWriter 2400, you can use the Color StyleWriter 2500 driver instead. After performing a clean install of Mac OS 8.5, you will need to re-install fonts and ink jet watermarks.

*** Switching between a LocalTalk network and a serial printer**
If you use the same port to alternately connect to a LocalTalk network and a serial printer, the port is not always correctly released after you turn off AppleTalk to use the printer. If you have trouble printing after turning AppleTalk off, restart the computer.

Miscellaneous Notes

*** Drive Setup and Energy Saver**
When using Drive Setup to perform an extended operation, such as testing the disk, initializing the disk with a low level format, or zeroing all data, use the Energy Saver control panel to set the hard drive sleep setting to *Never*. This will prevent errors caused by the hard drive spinning down before Drive Setup completes the operation.

*** QuickTake 150 software installs old version of QuickTime PowerPlug extension**
Mac OS 8.5 includes a new version of the QuickTime PowerPlug for computers with PowerPC microprocessors. The QuickTake 150 Installer replaces it with an older version (version 2.0). To install the QuickTake 150 software, first remove the newer version of the QuickTime PowerPlug

extension from the Extensions folder (within the System Folder) then install the QuickTake 150 software. After installation is finished, drag the PowerPlug file back to the Extensions folder replacing the older one.

*** QuickTake Image Access**
When you are copying pictures from a QuickTake 100 or QuickTake 150 camera to your computer, make sure all the pictures you want have finished copying before you erase the contents of the camera. Previously, you couldn't erase the camera until copying was completed. Mac OS 8.5 can perform other tasks while copying files so it's possible to accidentally erase the pictures before they have been copied from the camera. You cannot recover a picture once it is erased from the camera.

*** Using Acrobat PDF documents**
Some of the manuals included with Mac OS 8.5 are in Adobe Acrobat format. These files have *pdf* at the end of their names. To view or print these documents you must install Adobe Acrobat Reader, located in the Adobe software folder on the Mac OS 8.5 CD.

*** Using Monitors & Sound with add-on devices**
If you have a video or sound device that cannot be accessed using the Monitors & Sound control panel, use the Monitors control panel, or the Sound control panel, installed in the Apple Extras folder. Unless you specifically need to use these, the unified Monitors & Sound control panel should be used instead.

Mac OS 8.5: International Internet Access Read Me

The following is the International Internet Access Read Me document.
This article has been archived and is no longer updated by Apple.

Internet Setup Assistant

The Internet Setup Assistant can help you configure your computer to access the Internet through an Internet service provider (ISP) or through a network with an Internet connection.

If you already have an account with an ISP or you are accessing through a network:

1. Double-click the Internet Setup Assistant icon located in your Internet folder.
2. Click Yes to the question "Would you like to set up your computer to use the Internet?"
3. Click Yes to the question "Do you already have an Internet Account?"
4. Enter the information from your ISP or network administrator.

If you need to set up a new account with an ISP:

1. Contact an ISP in your region. A list containing some of the available ISPs is below.
2. Identify yourself as a Mac OS 8.5 customer.
3. Double-click the Internet Setup Assistant icon located in your Internet folder.
4. Click Yes to the question "Would you like to set up your computer to use the Internet?"
5. Click No to the question "Do you already have an Internet Account?"
6. Enter the information from the ISP. A summary of the information needed is below.

ISP Information

Ask the ISP for the following information to set up an Internet configuration. This information is also contained in the ISP Information Form located in the Internet Extras folder on the Mac OS 8.5 CD. You may want to fax this form directly to the ISP.

ISP local phone number (also known as the local point of presence, or POP)
account name (also known as login name or user id)
account password
DNS address (such as 12.222.6.78)
Domain name (such as isp.com) [optional]
e-mail address (such as name@isp.com)
e-mail password
e-mail account (such as name@pop.isp.com)
e-mail host computer (such as smtp.isp.com)
newsgroup host computer (such as news.isp.com) [optional]

Available ISPs

The following is a partial list of ISPs with Mac OS experience. Although many ISPs provide their own software for Internet access, Apple recommends that you use the Internet software included with Mac OS 8.5. Inclusion of an ISP on this list does not imply endorsement by Apple, Inc. or its subsidiaries.

Country	ISP	Phone
Colombia	Openway	(571) 629 0811
	Latinonet	(571) 312 2682
	Internet de Colombia	(571) 635 3088
	Colomsat	(571) 312 7288
Costa Rica	Inter@merica	(506) 256-5811
	Info@merica	(506) 257-7828
	Radiografica Costarricense S.A. (RACSA)	(506) 287-0087
Ecuador	Access Internet	593 2 674116
Indonesia	Meganet	(62) 21-521-2928
Malaysia	TMnet	(60) 3-733-1515
	JARING	(60) 3-966-5000
Mexico	Compuserve	(5) 629-8199
	INFOSEL	(5) 726-0070

	Internet Directo	(5) 241-2222 Ã³ sin costo 91-800-77634
	Mexico en red	(5) 639-3060
	MPSNet	(5) 639-6075
Peru	RCP	(511) 241-0308
Philippines	Mozcom	(63) 810-1760
Puerto Rico	Datacom Caribe	(787) 753-1771

Mac OS 8.5: Using English Text-to-Speech Read Me

The following is the Using the English Text-to-Speech Software Read Me.
This article has been archived and is no longer updated by Apple.
Using the English Text-to-Speech Software Version 1.5.3

With the English text-to-speech software installed, many Macintosh programs including SimpleText can read English text and the contents of many alert dialog boxes out loud. SimpleText comes with this computer and is already installed on your hard disk. (You are probably reading this document using the SimpleText program.)

The instructions in this document tell you:

- what you need to use this software

- how to install the software

- how to try out the software using SimpleText

- how to choose the default voice

- how to annotate text to improve intelligibility or add emotion

- some technical details, including what Text-to-Speech software is installed

- how to solve common problems

What you need to use the English Text-to-Speech 1.5.3 software.

To use this software, you need the following software and hardware.

- a Power Macintosh computer

- Mac OS 8.5

- at least 300 kilobytes of RAM in addition to what the rest of your system software takes

- at least 12 megabytes of available space on your hard disk

Installing the software.

To install the English text-to-speech software, follow these steps.

1. Print these instructions before you start. You will not be able to view them on screen during the installation.

2. If you have been using an earlier version of text-to-speech software, see the note at the end of this section.

3. Double-click the Installer that's in the same folder as this document.

4. Click "Continue", then click "Install". The installation takes a few minutes.

5. When you see a message reporting that the installation was successful, click Restart.

After the computer restarts, you can start using the text-to-speech software.

Note for users of older English text-to-speech software. Installing English Text-to-Speech software version 1.5.3 may remove some or all of your older English Text-to-Speech voices. You can restore those voices by downloading the older version of the English Text-to-Speech software from http://www.apple.com/speech, but only the text-to-speech software that came with Mac OS 8.5 has been tested by Apple to run on this version of the operating system. MacinTalk 2 and its associated voices (Ben, Boris, Brenda, Mariel, Marvin, Mr Hughes, Otis, Robovox, Votron, and Xero) are no longer supported. For a corresponding but more intelligible sound, we recommend trying Trinoids or Zarvox.

Trying out the Text-to-Speech software.

Follow these steps to try out text-to-speech software:

1. Open any SimpleText document. (This document will work well.)

2. Click anywhere in the text to make sure nothing is selected.

3. Choose "Speak All" from the Sound menu. (If you cannot hear anything, you may have the sound turned all the way off. Check in the Monitors and Sound control panel.)

4. If you want the computer to stop reading, choose Stop Speaking from the Sound menu.

You can also try the following:

- To read a portion of the file, select the words you want to read, then choose Speak Selection from the Sound menu.

- To have the computer speak in a different voice, select a voice from the Voices sub-menu in the Sound menu, then choose the Speak All or Speak Selection command from the Sound menu.

- To use the text-to-speech features of other programs, see the instructions that came with those programs.

Choosing the default voice.

You can use the Speech control panel to use your favorite voice as the default voice for all your programs. To set the default voice, follow these steps.

1. Open the Apple menu and choose Control Panels.

2. Open the Speech control panel by double-clicking its icon in the Control Panels window.

3. Open the Options pop-up menu at the top of the Speech control panel and choose Voice.

4. To change the default voice, choose the voice you want from the Voice pop-up menu. To hear what the voice you chose sounds like, click the speaker button.

5. To change the rate at which the default voice speaks, move the Rate slider.

6. Close the control panel.

Memory Constraints

If there is not enough memory available to hold a voice, then this software will not speak. The voices with "high quality" in their names have the most natural and intelligible sound, but take up the most memory. To see the memory requirements of the voices, view their sizes in the Voices folder, which is in the Extensions folder. To see how much memory you have available, click the desktop and then select "About This Computer" in the Apple menu.

Turning Talking Alerts on or off.

You can use the Speech control panel to turn Talking Alerts on or off. When this feature is on, your computer will read aloud the contents of alerts. (An alert appears, for example, when your printer runs out of paper.) To turn on the Talking Alerts feature, follow these steps.

1. Open the Apple menu and choose Control Panels.

2. Open the Speech control panel by double-clicking its icon in the Control Panels window.

3. Open the Options pop-up menu at the top of the Speech control panel and choose Talking Alerts.

4. To have your Macintosh speak a phrase like "Alert!" or "Hey!" when an alert appears, click the "Speak the phrase" check box to select it, and choose the phrase you want to be spoken from the adjacent popup menu.

5. To have your Macintosh speak the content of an alert when one appears, click the "Speak the alert text" check box to select it.

6. To adjust how long your Macintosh waits after an alert appears before speaking the alert text, adjust the slider beneath the "Speak the alert text" check box.

7. To test how Talking Alerts will behave with your chosen settings, click the speaker icon to the right of the slider.

To interrupt and cancel the computer's speaking, click the mouse or type a key.

Tip: You can edit or add to the phrases spoken when alerts appear. To do this, select "Edit Phrase List in the popup menu adjacent to "Speak the phrase:" And for extra interest, if you select "Next in the list" (in the same popup menu), then each time an alert appears a different phrase from the list will be spoken. You can make sequences of phrases which work together, such as following "It's not my fault" with "It's still not my fault".

How to annotate texts to improve intelligibility or add emotion

You can use punctuation and embedded commands to improve how the synthesizer speaks text. For example, select the following two texts and compare how they are spoken by the "Victoria, high quality" voice. We recommend that you turn up your volume and close your eyes to make this comparison.

There are big computers that are difficult to use there are small computers that are difficult to use And then there's Macintosh.

There are [[emph +]] big computers that are difficult to use, there are [[emph +]] small computers that are difficult to use. And then [[emph -]] there's: Macintosh!

For more details about how to use these commands, search for "Speech" in Apple Help.

Technical details.

The software that enables your computer to speak has these components:

- Speech Manager, a system extension

- one or both of these English speech synthesizers, which are system extensions that convert text to speech

- MacinTalk 3 for standard speech

- MacinTalk Pro for high-quality speech

- several voice files, each identified with one particular synthesizer

in the Voices folder in the Extensions folder

- the Speech control panel

- Speech Preferences, in the Preferences folder

The Installer removes older versions of Apple's Text-to-Speech software that won't run properly under Mac OS 8.5.

Troubleshooting (problems and solutions).

- My Macintosh won't speak.

- Turn up the speaker volume in the Monitors and Sound control panel.

- If this doesn't work you may not have enough memory for the voice you have selected. Use the Speech control panel to select "Fred", which is the smallest voice, then click the speaker button. If you hear speech, you did not have enough memory available. Try closing some applications or windows, or selecting a different voice.

- The Installer program says there's a problem with the hard disk.

- Re-install your system software, then try installing the English Text-to-Speech software again.

- The Installer program displays other error messages.

- Make sure you restart the computer with the Mac OS 8.5 CD as the startup disk.

- I had an older version of text-to-speech software, then did a custom installation of the new software, but some of my older voices disappeared.

- The custom installation you chose erased the older version of the software that can use MacinTalk 2 voices. You can re-install that old software by doing a custom installation from the English Text-to-Speech 1.4.1 installer.

Last update: 16th July, 1998.

Speech (n): Vocal articulation of thoughts and ideas.

Apple: What a User Group Can Do For You

This article describes how an Apple user group can be of benefit.
This article has been archived and is no longer updated by Apple.
What a User Group can do for you.

Looking for assistance with your computer or software? Wondering how to connect with other Mac users in your neighborhood?

Find a Mac User Group near you! User Groups are your connection to the Apple community around the world. Joining an Apple user group puts you in touch with a network of Apple users in your neighborhood and gives you access to important information and support resources.

Whether you're a beginner learning how to customize your desktop or a pro working on a killer application, chances are there's a user group near you that can help. So go ahead! Make the connection and join a local user group for their next meeting.

To find a User Group in your area, visit the User Group Locator at **http://www.apple.com/usergroups/**.

Mac OS 8.5: Open Transport 2.0 Read Me - Part 1

This document contains the Open Transport 2.0 Read Me part 1.

For part two of this read me, refer to article 58136: "**Mac OS 8.5: Open Transport 2.0 Read Me - Part 2**".
This article has been archived and is no longer updated by Apple.

Introduction

This Read Me document contains late-breaking information about Open Transport compatibility, add-on software, and solutions to known problems with third-party software. For instructions about how to use the Open Transport control panels (AppleTalk and TCP/IP), use the Help Center, or open one of the Open Transport control panels and click on the help icon. For additional technical information about Open Transport, see the "Open Transport 2.0 Technical Info" file that came with Open Transport.

Dialup network connectivity - TCP/IP

Native dialup network connectivity - AppleTalk

Native dialup network connectivity - TCP/IP

Tips for SLIP and PPP configurations

Known limitations and other issues

What's new in Open Transport 2.0 - general

* Open Transport 2.0 now supports AppleScript. Through the use of Network Setup Scripting (NSS) Macintosh owners can use AppleScript to configure all of the features of network communications currently available in the AppleTalk, Infrared, Modem, Remote Access, and TCP/IP control panels. These control panels continue to operate, with updates in this release. NSS will operate locally and remotely, offering powerful automation capabilities to end users and network administrators.

* Open Transport's implementation of the Dynamic Host Configuration Protocol (DHCP) has been Improved to support a number of requested features:

Client Identification.

Retention of the lease on a given IP address across reboots.

These changes address concerns about OT's DHCP compatibility with Windows NT DHCP servers.

The Open Transport DHCP implementation has been enhanced to now support RFC 2131.

Temporary generation of an IP address when no DHCP server is available (See OT 2.0 technical info document for more information).

* When using the new DHCP Client ID feature, the Client ID is entered into a new field in the TCP/IP control panel.

* Support for the Simple Network Management Protocol (SNMP) is available for Open Transport. Support for the version 2 Management Information Base (MIB II), instrumentation for AppleTalk and TCP/IP protocols and transports, administrative tools, and system agent support for the PCI bus is now provided. See the Open Transport SNMP Read Me on your Mac OS 8.5 CD for additional information.

* In the 2.0 release of the TCP/IP control panel, a feature has been added to simplify inputting the IP address and subnet mask for static IP addressing. Users can enter an IP address in standard "dot" notation in the "IP Address" text box, and immediately follow it with a slash ("/") and a number ranging from 1 to 32 indicating the number of contiguous one bits in the subnet mask, counted from the high-order bit. For example, if a user's IP address was "198.162.22.10", and the appropriate subnet mask was "255.255.255.252", the user could enter "198.162.22.10/30" in the "IP Address" text box. Once the box was tabbed past, the corresponding values would be entered into the "IP Address" and "Subnet Mask" text boxes. (This form of notation is supported in IPv6).

Bugs Addressed

* Open Transport 2.0 addresses an issue in which copying a large number of files from a mounted server could cause the server connection to time out and the client system to crash.

* This release fixes a problem where incorrect DNS lookups could crash OT DNR.

* A bug in which rejected TCP connections could induce a relatively lengthy delay on the system initiating the connection has been fixed.

* Open Transport 2.0 now fixes several problems with the OT Printer Access Protocol (PAP) Server:

OT PAP server would only allow 31 connections.

OT crashes after PAP spooler closed, after statechange error occurs.

Crash when trying to print more than one document on LaserWriter software version 8.0

PAP server written to handle multiple connections will stop processing incoming data under some circumstances when there are multiple simultaneous connections.

* This version of Open Transport addresses cases where sleep could cause a crash or unexpected system behavior.

* Open Transport 2.0 has improved support for third party LocalTalk devices.

* This release includes multiple fixes to improve compatibility, performance and stability on servers using AppleShare IP 5.0.2 and beyond.

* Additional bug fixes are included to the Open Transport to address problems with DHCP functionality, SNMP functionality, and to increase overall performance.

Network interface options

Open Transport supports PCI bus, NuBus, communications slot, and PC Card network interface cards, as well as built-in LocalTalk, Ethernet, and Token Ring network adapters. For supported computers without expansion options, Open Transport 2.0 also supports a SCSI-attached network adapter. Third party network interface options available for Open Transport include Fast Ethernet, ATM, and FDDI.

General compatibility

Open Transport is compatible with:

- existing applications that use AppleTalk as specified by Apple, Inc.
- existing applications that use MacTCP as specified by Apple, Inc.
- existing devices (such as printers) that you select in the Chooser
- existing NuBus network interface cards for the Mac OS

Computers running Open Transport can be added to an existing AppleTalk or TCP/IP network without upgrading other computers on the network.

Apple product compatibility update

* At Ease version 2.x or 3.x may encounter problems when starting up with Open Transport. At Ease Update 1.0 will update non-Workgroup versions of At Ease 2.x or 3.x to include Open Transport compatibility. If you are using At Ease for Workgroups, you should upgrade to version 3.0.2 or later. Both can be found on Apple Software Update sites on the Internet and selected online services.

* Apple has exited the market as a vendor for Token Ring products. Apple has no plans for any new Apple-branded Token Ring products for Mac OS. The company also does not plan to offer any additional driver updates or hardware/software fixes for Apple's NuBus or PCI Token Ring cards. We will not be testing or shipping legacy Token Ring software in our new releases of Mac OS.

Even though no further products, updates, or fixes are planned, Apple continues to recognize that selected Mac OS users have an ongoing requirement for Token Ring products. Towards this end, Apple has been closely working with Madge to ensure the availability of 3rd party Token Ring products that are compatible with the latest Apple hardware and the Mac OS operating system. Madge Token Ring products are available through authorized Madge resellers. Visit their web site at **http://www.madge.com** for more information.

* Apple LocalTalk Bridge 2.1 is compatible with Open Transport. (See known incompatibilities for more information)

* Apple Remote Access (ARA) Multiport Server 2.1, ARA Client 2.0.1 and later, and ARA Personal Server 2.0.1 and later are compatible with Open Transport 1.1 and later.

* Apple PCI-based Workgroup servers (Application, AppleShare, and Internet) are compatible with Open Transport 1.1 or later.

* Computers running the current versions of Apple IP Gateway and AppleTalk Internet Router must not be updated to Open Transport; these products are based on classic networking. These products do, however, interoperate with computers using either classic or Open Transport networking. Apple has not yet announced plans regarding future versions of these products.

* Apple's MacTCP Ping is not fully compatible with Open Transport; no update is planned.

* ZapTCP is a classic networking tool and is neither compatible nor needed with Open Transport. Functionality similar to ZapTCP is built into Open Transport.

Dialup network connectivity - AppleTalk

For dialup connectivity to AppleTalk networks, Open Transport supports Apple Remote Access version 2.0.1 or later.

Dialup network connectivity - TCP/IP

For dialup connectivity to TCP/IP networks (including the Internet) Open Transport supports third-party extensions known as "MDEVs." Serial Line Interface Protocol (SLIP) and Point to Point Protocol (PPP) connectivity are provided in this manner. Not all versions of all MDEVs are compatible with Open Transport 1.1 and later.

Open Transport 1.1 and later recognizes and is compatible with the following MDEVs. When properly installed they appear in the "Connect via" pop-up menu in the TCP/IP control panel.

* FreePPP - version 1.0.5 or later

FreePPP is shareware and can be found on the Internet, typically at "info-mac" mirror sites in the comm/tcp/conn directory.

FreePPP versions prior to 2.5 may experience problems when running with virtual memory turned on (including RAM Doubler). If you have problems using FreePPP with VM, either update to FreePPP 2.5, or temporarily turn VM off. The current version of FreePPP is 2.6.

* MacPPP - version 2.1.4 or later (MacPPP 2.5 or later is recommended)

MacPPP versions prior to 2.5 may experience problems when running with virtual memory turned on (including RAM Doubler). If you have problems using MacPPP with VM, either update to MacPPP 2.5, or temporarily turn VM off. An Open Transport-compatible version of MacPPP (MacPPP 2.5) is included in the Open Transport Extras folder. For more information, please refer to the MacPPP Read Me document.

* InterPPP II - version 1.1 or later

InterPPP II is a commercial software product. It has been replaced by CONNECT4ppp which is part of tcpCONNECT4. tcpCONNECT4 can be purchased from VisionSource at 800.326.7427.

* MacSLIP - version 3.0.4 or later

MacSLIP is commercial software developed by Hyde Park Software. For availability and ordering information in the U.S., contact TriSoft at 800-531-5170 or 512-472-0744.

* Sonic PPP - version 1.0.2 or later

SonicPPP is commercial software developed by Sonic Systems, Inc. For availability and ordering information in the U.S., contact Sonic Systems at 408-736-1900 (voice) 408-736-7228 (fax). For more details see the Sonic Systems Web page at <http//www.sonicsys.com/>.

* NTS PPP - 2.0 or later

NTS PPP is commercial software developed by Network Telesystems, Inc. For availability and ordering information in the U.S., contact Network Telesystems at 408-523-8100 (voice) 408-523-8818 (fax).

* LAN TunnelBuilder is a Virtual Private Network technology from NetworkTelesystems, Inc.

* SAT/SAGEM PPP - 1.02b1 or later

SAT/SAGEM PPP is commercial software developed by SAT/SAGEM. For availability and ordering information in the US, contact SAT/SAGEM at 408-446-8690 (voice) 408-446-9766 (fax).

* LeoTCP - 2.0.1 or later

LeoTCP is commercial software developed by Hermstedt GmbH. For availability and ordering information in the U.S., contact Hermstedt USA at 1-800-828-5522 (voice). In Europe contact Hermstedt GmbH at +49 621-76500 (voice) +49 621-7650100 (fax).

* T-Online CSLIP - version 1.0.3 or later

T-Online CSLIP is commercial software developed by Computer Consulting GbR. For availability and ordering information in Europe, contact

format network & communication at 49-2206-95840. For more details, contact format network & communication at info@format.de.

* University of Michigan ISDN - 2.0.6 or later

In addition to these, there are a number of other MDEVs (examples include those from Pacer, FCR, and Tribe) which are indistinguishable from one another to Open Transport. When installed, these appear in the "Connect via" pop-up menu as "TCP/IP PPP."

* AOL Link

AOL Link is commercial software developed by America OnLine. It is part of the America OnLine client software that is available from AOL's ftp site and allows use of MacTCP or Open Transport compatible TCP/IP applications while connected to AOL. The latest version of the AOL client is on the AOL ftp site at **ftp://ftp.aol.com/**.

* CompuServe PPP is a commercial PPP implementation specifically designed for connecting to CompuServe. You can obtain it from the CompuServe web site at **http://www.compuserve.com/**.

Native dialup network connectivity - AppleTalk

* Apple Remote Access - version 3.0 or greater

Open Transport supports extensions that use the STREAMS architecture. Apple Remote Access 3.0 takes advantage of these capabilities. ARA 3.0 is available in retail packages in a Client and Personal Server version. ARA 3.0 supports AppleTalk and TCP/IP protocols concurrently over a PPP connection and is also compatible with ARA 2.x family clients and servers.

Native dialup network connectivity - TCP/IP

* Apple Remote Access - version 3.1

ARA 3.1 offers the same features as OT/PPP for dialup access to a TCP/IP network.

* OT/PPP - version 1.0 or later

Open Transport supports extensions that use the STREAMS architecture. OT/PPP is available on the Apple Software Update sites on the Internet and requires Open Transport 1.1.1 or later.

Mac OS 8.5: Open Transport 2.0 Read Me - Part 2

This article contains the Open Transport 2.0 Read Me part 2.
For part one of this read me, refer to article 58135: "**Mac OS 8.5: Open Transport 2.0 Read Me - Part 2**".
This article has been archived and is no longer updated by Apple.

Tips for SLIP and PPP configurations

* Some MDEVs are known to be incompatible with other MDEVs. If you experience problems, remove unused MDEVs so that only the MDEVs you need are installed on your computer at a given time. If you still encounter problems, you may have to reduce the number of MDEVs installed to one to prevent conflicts.

* Users who dial into a TCP/IP network or Internet Service Provider (ISP) may have been assigned a router (gateway) address that is not a part of their local subnet. This was an accepted but technically invalid configuration for MacTCP. Open Transport users should not enter a value for the router address or subnet mask; Open Transport/TCP generates correct values for these fields automatically. In unusual circumstances, these supplied values can be overridden using the Administration mode of the TCP/IP control panel.

* If BootP is used over SLIP or PPP for interface configuration, and if BootP returns additional default router addresses, Open Transport will automatically add those addresses to the list of default routers.

* When Open Transport is installed on a computer that previously had MacTCP configured for a server configuration, the initial configuration method-the selection in the "Configure" pop-up menu in the TCP/IP control panel-is set for the use of a BootP server. This default may not be the appropriate choice for you; please verify.

If your computer was previously configured for MacTCP "server" addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:

1. Open the TCP/IP control panel.

2. Choose Using PPP Server or Using SLIP from the Configure pop-up menu.

3. Close the TCP/IP control panel, and save changes when prompted.

4. Try connecting again.

If your computer was previously configured for MacTCP "manual" addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:

1. Open the TCP/IP control panel.

2. Choose Manual from the Configure pop-up menu.

3. Verify that the correct IP address is entered in the Address field.

4. Close the TCP/IP control panel, and save changes when prompted.

5. Open the configuration utility supplied with your SLIP or PPP software, and verify that it also reflects the correct IP address in the appropriate location. Refer to the documentation supplied with your SLIP or PPP software for further information on how to enter an IP address, and how to save an updated configuration.

6. Try connecting again.

Note: In MacPPP's ConfigPPP control panel, this setting is entered in the IPCP dialog box. Refer to the documentation that came with MacPPP or FreePPP for additional information.

Known limitations and other issues

* Open Transport 2.0 has been qualified with Mac OS 8.5 only, using Open Transport 2.0 with any other version of the Mac OS may result in anomalous behavior.

* When TCP/IP is set to "Load only when needed" (in the control panel's Options window), "pinging" an Open Transport workstation will fail if a TCP/IP application is not currently being used. To make sure your computer is "pingable" at all times, turn off the "Load only when needed" option (open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X) and restart your computer. The Options button is available in Advanced and Administrator user modes.

* When TCP/IP is set to "Load only when needed" (in the control panel's Options window), the first TCP/IP application opened will cause Open Transport to load into memory. Some older applications don't cause Open Transport to load, and then report errors similar to those encountered when MacTCP is not installed. If this is a problem, turn off the "Load only when needed" option (open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X) and restart your computer.

* Generally, you should turn on the "Load only when needed" option in the TCP/IP control panel when using a modem. If TCP/IP is always loaded ("Load only when needed" is not checked), your modem may attempt to initiate a dialup connection at startup. Some MDEVs require more system heap memory than is available at startup, which may cause the computer to hang. Also, some Internet service providers charge by connect time, so you may be charged for the connection, even if you weren't using it.

* The preferred method to make AppleTalk active or inactive is to use the AppleTalk control panel. Using the Chooser or control strip to make AppleTalk inactive may not completely deactivate AppleTalk.

* The TCP/IP control panel is able to obtain and utilize multiple gateway and name server addresses from DHCP and BootP servers. However, it will currently display only the first one, and then only in Basic user mode. This should be addressed in a future release.

* If you use MacSLIP, you should likewise not configure the MacSLIP control panel to initialize MacSLIP at system startup time. As stated above, this may require more system heap memory than is available at startup, which may cause the computer to hang.

* If you are experiencing problems when using MacSLIP with virtual memory on, increasing your virtual memory size may give you better results. (Use the Memory control panel to increase virtual memory.)

* Some MacTCP-based applications will not function correctly unless the MacTCP DNR file is in its original location at the root level of the System Folder.

* You should only specify use of 802.3 framing in the TCP/IP control panel if you have been directed to do so by your network manager, or if you are sure that all other stations on your network segment, including your IP router(s), are also configured to use 802.3 and not Ethernet version 2.0 framing.

* Claris Emailer version 1.1 v3 or later and Claris Emailer Lite version 1.1 v4 or later is compatible with Open Transport 1.1.2 and later. Earlier versions of Claris Emailer may not be compatible with Open Transport's "Load only when needed" configuration option. If you experience a system crash 2-3 minutes after quitting Emailer, turn off the "Load only when needed" option. (Open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the X.)

* MacTraceRoute Ethenet LAP does not work on computers running Open Transport. There are a number of Open Transport native traceroute programs, including:

IPNetMonitor **http://www.sustworks.com/**,

WhatRoute **http://crash.ihug.co.nz/~bryanc/**,

and Mac TCP Watcher **http://www.stairways.com/**

* NFS/Share versions 1.4.4 or later are compatible with Open Transport. NFS/Share is now part of Intragy Access from Ascend **http://www.ascend.com/**.

* When using Netware Client version 5.11 configured for NetwareIP service, the first login may yield a Netware Configuration error message. To avoid this error, open the NetwareIP control panel and change the value under Domain SAP Server (DSS) Retry Attempts from 1 to 2. You can also change Open Transport TCP/IP control panel to always load TCP/IP into memory (open the TCP/IP control panel, click the Options button, and click the "Load only when needed" box to remove the X).

* eXodus 5.2.2 and later versions are compatible with Open Transport.

* Versions of Anarchie prior to 1.6 have a data corruption problem when used with Open Transport. Make sure you are using Anarchie 1.6 or later.

* If an Apple Remote Access (ARA) user is on a non-routed, extended (Ethernet) network, and there are devices on the local network with the same network number as devices on the remote network, the user won't be able to see the local devices. This problem can be fixed by installing a router. Another work around is to clear the PRAM on the ARA computer. (Hold down the Command, Option, and PR keys simultaneously while starting up the computer). Clearing PRAM causes the computer to start up with a new network number, which should not conflict with the remote network number.

* Daemon 1.0.0 & Daemon Killer 1.0 are not compatible with Open Transport.

* MudDweller 1.2 is not completely compatible with Open Transport. You can open new connections, but the "reconnect" choice does not work correctly.

* The system will crash during launch of NetPresenz if Open Transport TCP/IP is configured to use MacIP and the selected zone has no MacIP server.

* Current versions of VersaTerm SLIP are not compatible with Open Transport.
* Problems can occur with old versions of the KeyServer package from Sassafras Software when TCP/IP is configured to"Load only when needed" (in the control panel's Options window). Contact Sassafras for the latest revisions at **http://www.sassafras.com**.

TA25781_Mac_OS_Open_Transport_Read_Me_Part_.pdf

* To use the CSI Hurdler serial card with Open Transport, contact CSI to get a copy of their preference file patch. This will enable the card to be compatible with Open Transport 1.1.2 or later.

Open Transport 2.0 Technical Information - Part 1

This article comprises the Read Me for Open Transport 2.0 Technical Information, part of Open Transport Extras version 2.0.3. This software was released by Apple 10 May 1999 and is available for downloading from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Requires Mac OS 8.6 (English-North American).

This article has been archived and is no longer updated by Apple.
This document contains technical information about Open Transport that may be useful to network managers and administrators. You do not need to read this document in order to use Open Transport.

Refer to article 60355: "**Open Transport 2.0 Technical Information - Part 2.**" for the second part of this article.

Performance

Introduction

Open Transport is modern networking and communications system software for the Mac OS. It is based on industry standards and brings a new level of networking connectivity, control, and compatibility to Mac OS computers, while preserving built-in support for easy-to-use networking. Open Transport 2.0 is supported on system software version 8.5 or later. No other system software versions are supported.

For more important information about system requirements, compatibility, and known incompatibilities and limitations, read the "Open Transport 2.0 Read Me Parts 1 &2" documents.

Files added by the Open Transport installer

Open Transport installs the AppleTalk and TCP/IP control panels into the Control Panels folder inside the System Folder of your startup disk. The Open Transport Installer also adds the following files to the Extensions folder inside the System Folder:

Shared Library Manager

Shared Library Manager PPC

These extensions implement a shared library mechanism on 68K and PowerPC Mac OS computers, respectively. Both extensions are required on PowerPC-based computers in order to support both emulated and native shared libraries.

OpenTransportLib

Open Transport Library

These shared libraries implement core Open Transport services on both 68K and PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptAppleTalkLib

Open Tpt AppleTalk Library

These shared libraries implement Open Transport AppleTalk services on both 68K and PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptInternetLib

Open Tpt Internet Library

These shared libraries implement Open Transport TCP/IP services on both 68K and PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

CFM 68k Support File Name

This file adds support for CFM 68k. It is not installed by Mac OS 8.5 or on PowerPC-based computers.

Network Setup Scripting

Network Setup Scripting (NSS) is a faceless background application that receives and processes AppleEvents that can change or report network configuration parameters.

Network Setup Extension

This is the shared library that implements a database of network configuration data. The same data that is available in the AppleTalk, Modem, Infrared, Remote Access, and TCP/IP Preferences

files (Prefs) is available via NSE.

SNMP File name

This extension implements SNMP for Open Transport. SNMP can be configured using the SNMP Administrator Application. SNMP can be disabled by deleting this extension or disabling it using the Extensions Manager control panel.

Open Transport AppleTalk Features

Static and dynamic AppleTalk address allocation

Open Transport AppleTalk supports static assigned (manually administered) protocol addresses as well as the dynamic addressing provided by AppleTalk Address Resolution Protocol (AARP). Static addressing allows AppleTalk nodes to be managed using the protocol address as a unique and stable identifier.

It is important that all nodes on each individual AppleTalk subnet (a given cable segment assigned a unique network number or network number range) be administered consistently-either all with dynamic addressing or all with preassigned static addresses. This avoids a potential conflict when a new dynamic node acquires an address assigned to manually-addressed node that is not connected or is off line. Administrators can enforce the addressing policy for a subnet by locking the addressing mode. As a precaution, Open Transport AppleTalk checks for duplicate protocol addresses on the LAN even when static addressing is configured.

Use of parameter RAM

Under classic AppleTalk, AppleTalk's on/off state, the selected network interface, the previous network (protocol) address, and the previous AppleTalk zone name are saved in persistent memory (parameter RAM) for reuse at startup. To ensure backward compatibility, this information is

still stored and retrieved on systems using Open Transport AppleTalk. However, the following differences are found with Open Transport:

* At startup, Open Transport reads the current AppleTalk configuration file to determine if AppleTalk should be turned on or off. This value overrides the value saved in parameter RAM. The user is not explicitly notified when this occurs.

* If the network interface specified in the current AppleTalk configuration file is locked and the specified port is not available or cannot be initialized, Open Transport will not automatically switch the port back to LocalTalk. Instead, AppleTalk will remain off. The user sees a dialog box with this information.

Open Transport TCP/IP features

Open Transport brings a workstation-class implementation of TCP/IP protocols to Mac OS. As with MacTCP, Open Transport TCP/IP is a full 32-bit stack. Open Transport TCP/IP adds support for:

- Dynamic path MTU discovery, for more efficient network use in heterogeneous network topologies.
- Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration management.

DHCP is an Internet Engineering Task Force (IETF) standards-track protocol. (RFC 2131)

- IP multicast, for participation as an MBone client for applications written to the native Open Transport API.
- Simultaneous TCP connections for applications written to the native Open Transport API are limited only by installed memory and processor power, for increased functionality as an Internet or other TCP/IP network server.
- A new, more robust and standards-compliant domain name resolver (a caching stub DNR).
- Support for developer access to raw IP services, as well as TCP and UDP.
- Ethernet Version 2.0 and IEEE 802.3 framing, for better interoperability with a wider range of TCP/IP hosts.
- Implicit and explicit domain name search paths, for increased control of domain name resolution.
- Use of multiple IP routers with fail-over, for increased robustness in mission-critical applications.
- TCP wildcard source port assignments start at 2048, increasing from that point.

DHCP server support

Apple's implementation of DHCP conforms to RFC 2131. To date, Open Transport TCP/IP has been tested with the following DHCP server implementations:

- Competitive Automation (**http://www.join.com**)
- FTP Software (**http://www.ftp.com**)
- Hewlett Packard HP-UX (**http://www.hp.com**)
- Microsoft Windows NT Advanced Server (**http://www.microsoft.com**)
- Silicon Graphics (**http://www.sgi.com**)
- Sun Solaris and SunOS (**http://www.sun.com**)
- TGV (**http://www.tgv.com**)

DHCP address lease support

Open Transport TCP/IP supports DHCP address leases. Open Transport TCP/IP automatically attempts to renew any address lease that reaches its renewal interval (by default, the renewal interval is reached when the lease is halfway completed). The renewal interval may be configured to a different value by making changes to the configuring DHCP server. Renewal is attempted regardless of how many times the lease has already been renewed. Lease rebinding is also supported. Should an interface's IP address lease expire, the interface is closed down.

Open Transport TCP/IP now supports the DHCP Client ID option, and now will use the remainder of a previous but unexpired lease on a given IP address across reboots. There has been an improvement in the user feedback in the event that a DHCP server is not available. There have been improvements to the DHCP functionality to offer better support of Windows NT DHCP servers.

Self-assigned DHCP Addresses

A new feature has been added to the Open Transport TCP/IP DCHP implementation.

In Open Transport 1.3.1 and earlier, when a client first opened a TCP/IP endpoint in DHCP mode DHCP sent out a DHCPDISCOVER broadcast packet looking for any DHCP server on its local network, or accessible to its local network via a DHCP/BootP relay agent. If a DHCP server was not available the TCP/IP stack unloaded and the client endpoint failed to open, returning an error message to the client.

The new behavior with Open Transport 2.0 and later is that if a DHCP server is not available, after about a 16-20 second wait, DHCP will generate a temporary configuration and use it to configure the TCP/IP stack.This temporary configuration consists of an IP address randomly chosen in the range 169.254.0.0 to 169.254.254.255 inclusive and a subnet mask of 255.255.0.0. (i.e. one of 65,535 possible IP addresses are

chosen at random to minimize address collision.) There will be no DNS server or gateway address included with the temporary configuration.

The above configuration is given a total lease time of 10 minutes and a renewal time of 5 minutes. When the renewal time of 5 minutes expires, the DHCP module has been changed to try to again find a DHCP server and if it does find one it will reconfigure TCP/IP to use the new configuration. If it fails to find a server it again sets its renewal timer for another 5 minutes and will continue to use the same temporary IP address.

It should be noted that the first DHCP server the client will send the DHCPRequest broadcast packet to is the server which provided the last configuration. If the server which provided the last configuration fails to answer, the client will resort to broadcasting DCHPDISCOVER, looking for a DHCP server. If it fails to find a server, the client will then auto configure itself with a temporary IP address.

In most cases there's either a DHCP server available when a machine starts or there is never one available. The above strategy allows users to use auto configured IP addresses on private

networks where there is never a DHCP server. This means the ability to use services like AppleShare/IP out of a box without configuring anything. It however does not address how one finds or browses for services by name as with a DNS server provided functionality. (This feature is included in Windows 98)

Windows NT advanced server support

With Open Transport 1.1 and later, Mac OS clients are interoperable with the Windows NTAS DHCP server on LAN links. However, Mac OS clients cannot acquire configuration information from an NT DHCP server across a dialup (PPP) link because there is not yet an accepted industry standard for DHCP over dialup. The NT implementation is based on proprietary Microsoft extensions. Mac OS clients cannot acquire configuration information nor register with a Microsoft WINS server. WINS is also dependent on Microsoft extensions to TCP/IP (requiring NetBIOS support).

Apple has implemented a protocol independent API for locating services on networks, known as Network Service Location (NSL). This API is included as part of Mac OS 8.5. NSL is based around a plug-in architecture and one of the bundled plug-ins implements Service Location Protocol (RFC 2165), which allows for cross-platform dynamic registration and look-up of names on an IP network.

BootP support

Open Transport 1.1 and later fully supports Bootstrap Protocol (BootP). Versions of Open Transport prior to 1.1 failed to accept a BootP Reply sent to the unicast (subnet broadcast) address, (for example, xxx.xxx.xxx.255. Replies sent to the all-nets broadcast address (for example, 255.255.255.255) were handled properly.

Local Hosts file support

Open Transport TCP/IP supports a Hosts file that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. The Hosts file is normally stored in the Preferences folder in the active System Folder. When Open Transport TCP/IP is initialized, it reads the Hosts file (if any). As in MacTCP, the supported Hosts file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Open Transport TCP/IP is more stringent regarding the content and format of the Hosts file than was MacTCP, which permitted violation of the FQDN requirement for <domain-name>. For instance, the format:

charlie A 128.1.1.1

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP ("charlie" could potentially exist in any or all of the configured domains). To accomplish the same effect, use this format instead:

charlie CNAME myhost.mydomain.edu

myhost.mydomain.edu A 128.1.1.1

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu, and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

You can create a Hosts file with any text editor or word processor (the Hosts file must be stored in text format). If you use a Hosts file, keep it as short as possible, and include only entries that will be accessed frequently. This reduces the memory required to cache the DNS information and minimizes the need to maintain and update Hosts files as system information changes.

Open Transport TCP/IP automatically uses a Hosts file stored the Preferences folder of the active System Folder. If no Hosts file is found in the Preferences folder, Open Transport TCP/IP searches the active System Folder for a Hosts file. You can specify a particular Hosts file to use with a specific configuration. For example, one Hosts file might be set up for a user connecting via Ethernet, and another set up for when that user connects via modem.

Single Link Multi-homing System Setup

Open Transport 1.3 introduced Single Link Multi-homing, a mechanism by which Open Transport can support multiple IP addresses on the same

hardware interface. Synonyms for this feature include IP Aliasing, Secondary IP address Support, IP Masquerading, "Multihoming", IP Multinode support. This is useful for sites like Internet Service Providers (ISPs), that want to give each of their clients a distinct IP address, without requiring separate computers for each address. Web server software packages, or server plug-ins that utilize this feature can offer virtual domain support that supports all web browsers. You will need to contact your application developer to see if they are supporting this new feature of Open Transport. This feature is only available with Open Transport 1.3 and later.

You configure a system to use multiple IP addresses as follows:

1. The TCP/IP Control Panel must be set for manual addressing.

2. You create a text file with the required name "IP Secondary Addresses" and put it into the Preferences folder in the System Folder.

Each line of the IP Secondary Addresses file contains a secondary IP address to be used by the system, and an optional subnet mask and router address for the secondary IP address. If there is no subnet mask entry, then a default subnet mask for the IP address class will be used. If there is no router address entry, then the default router associated with the primary address will be used.

Each secondary address entry must be prefixed by "ip=". Each subnet mask entry must be prefixed by "sm=". Each router address entry must be prefixed by "rt=". Lines proceeded by a ; are ignored. An example of the contents of the IP Secondary Addresses file follows.

'ip=' for ip address, 'sm=' subnet mask, 'rt=' router address. There should be no commas in this line as shown between entries.

Note: No space in 'ip=192.168.22.200'

IP address Subnet Mask router addresses

---------- ---------- ----------

ip=192.168.22.200 sm=255.255.255.0 rt=192.168.20.1

ip=192.168.22.201 rt=192.168.20.1

ip=192.168.22.202

The order of the entries is important. The "rt=" entry must follow the "sm=" entry if used.

When Open Transport activates TCP/IP, the primary address will be obtained from the TCP/IP Control Panel setting. Open Transport then looks for the IP Secondary Addresses file in the Preferences folder to determine if additional addresses should also be configured. If there are duplicate IP address entries in the IP Secondary Addresses file, the duplicate addresses will be ignored. When Open Transport binds a TCP/IP connection, if there is an address conflict with either the primary or any secondary addresses with another host, Open Transport will present an error message using a dialog box and unload Open Transport/TCP from memory. The error dialog will display the conflicting IP address, the hardware address of the conflicting machine and note that your TCP/IP network interface has been shut down.

To resolve the conflict, quit all of the TCP/IP applications on both conflicting machines, reconfigure TCP/IP on one of the machines so there is no longer an address conflict, then relaunch your TCP/IP applications.

MacTCP "server" addressing support

Open Transport TCP/IP supports both Bootstrap Protocol (BootP) and Reverse Address Resolution Protocol (RARP) configuration methods. MacTCP Server mode addressing was a combination of BootP and RARP. When Server mode was selected, MacTCP used BootP to attempt to acquire an IP address. If that failed, MacTCP tried RARP. Whichever protocol was successful was stored as a preference, and was used first the next time the computer started up. In Open Transport, you must choose BootP or RARP explicitly.

MacTCP "dynamic" addressing

Open Transport does not support MacTCP "dynamic" addressing. MacTCP dynamic mode addressing was based on an Apple-proprietary extension to TCP/IP protocols. It applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks, making it very easy to set up a Macintosh-only standalone TCP/IP network. Use of this dynamic addressing method in other scenarios, however, could create additional work for a network administrator.

The Internet community (IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Open Transport TCP/IP supports the industry standard DHCP.

MacIP support

MacIP is a protocol specification developed for carrying TCP/IP traffic on AppleTalk-only networks, originally LocalTalk networks. MacIP is today frequently used with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services.

Use of MacIP typically requires a gateway, which strips off the AppleTalk encapsulation and places the IP packet on the TCP/IP LAN. When packets are sent back to the MacIP end-node, the gateway replaces the AppleTalk encapsulation. MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network.

Open Transport supports MacIP in the TCP/IP control panel. Once selected, TCP/IP data is encapsulated in AppleTalk packets, and is sent through the selected network interface.

PPP connectivity

PPP (Point to Point Protocol) connectivity for Open Transport is currently based STREAMs modules or on the use of third-party software extensions known as "MDEVs." Early versions of some MDEVs may not be compatible with Open Transport. For information about MDEV compatibility, see both parts of the "Open Transport 2.0 Read Me" document.

STREAMs based PPP solutions are available from Apple and selected 3rd parties. Open Transport/PPP and Apple Remote Access 3.0 both use STREAMs. For more information about PPP see both parts of the "Open Transport 2.0 Read Me" document.

Memory requirements

The actual memory requirements of Open Transport vary depending upon the networking services in use at a given time. Factors contributing to differences in memory requirements include:

- Open Transport provides "mixed-mode" applications support, making it possible for both PowerPC native and 680x0 applications to use native networking on PowerPC-based computers.
- Open Transport includes both the new implementations of networking and the libraries required to provide backward compatibility support for the older AppleTalk and MacTCP programming interfaces.
- Open Transport requires less memory on systems with virtual memory enabled.

Application compatibility guidelines

Apple has defined three levels of interoperability with Open Transport. The first, "Open Transport Compatible," is used to describe network applications originally developed for classic AppleTalk or MacTCP programming interfaces that now take advantage of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the Open Transport control panels. However, they will not realize a significant performance increase on Power Macintosh systems, nor can they take advantage of Open Transport's transport-independence capabilities.

Open Transport Ready applications have adopted the new Open Transport APIs. They are PowerPC native, in addition to running on 680x0-based Macintosh systems. Open Transport-ready applications benefit from the new control panels and may also realize a significant performance boost when running on PowerPC-based computers.

The highest category of interoperability is Open Transport Enhanced. In addition to adopting the new Open Transport APIs and being Power PC native, these applications can be dynamically configured to support AppleTalk, TCP/IP, or serial communication.

Applications that rely on undocumented APIs or examine private data structures in AppleTalk or MacTCP may not be fully compatible with Open Transport. Updated versions of these software products will be required for full compatibility.

Performance

Open Transport is designed to take advantage of the PowerPC processor. For maximum performance, however, networking applications must also take advantage of the PowerPC processor, and should adopt the new Open Transport programming interfaces.

Some Mac OS networking applications use the classic networking programming interfaces. These applications can still be used with Open Transport, and may perform somewhat better. Networking applications that are PowerPC-native but not Open Transport-ready may yield better performance, but still fall short of the maximum potential performance because they make use of Open Transport backward compatibility rather than its full capabilities.

Performance improvements will be greater with protocols that use larger datagram sizes. For example, TCP/IP users will see greater improvements than AppleTalk users, because AppleTalk has a fixed and limited datagram size. On high-speed datalinks such as fast Ethernet, FDDI, and ATM, the performance of the network interface card (NIC) driver code is also a significant factor.

Overall performance also depends on the amount of RAM available. Larger packet sizes and higher throughput place increased demand on the buffering system of Open Transport. If Open Transport becomes low on memory, throughput decreases to accommodate the limitation.

Mac OS 8.5: Printing PDF Files in the Background

I have noticed .PDF files print in the foreground. Installed on my Macintosh are Mac OS 8.5, LaserWriter 8.6, and Adobe Acrobat Reader 3.0 (3.01).
This article has been archived and is no longer updated by Apple.
Printing .PDF files in the background from Adobe Acrobat Reader and LaserWriter 8.6 is possible after installing and enabling Adobe Type Manager (ATM), in the Control Panels folder.

Although ATM ships with Acrobat Reader, it does not get installed automatically. Therefore, locate ATM in your Adobe Acrobat 3.0 folder and either drag it on top of the System Folder or directly into the Control Panels folder, then reboot your Macintosh. Note the default setting for ATM is active; however, if ATM is set to off, you will not be able to print in the background until you open the ATM Control Panel and set it to on.

If you need a current copy of Acrobat Reader and ATM, they are on the Mac OS 8.5 CD (CD Extras: Acrobat Reader).

iMac: CD Firmware Update Disables CD Access Light

Installing the iMac CD Firdware Update will disable the CD-ROM drive access light.
This article has been archived and is no longer updated by Apple.
When Apple began shipping iMac computers, the amber activity light on the iMac CD-ROM drive was enabled. Initial customer feedback showed that this light was not necessary and detracted from the iMac cosmetically.

When the iMac CD Firmware Update was developed, this light was intentionally disabled via the new firmware to prevent this light from shining through the translucent plastics of the iMac. This was a cosmetic consideration and will not affect any functionality of the CD-ROM drive.

You should only use this update if you are experiencing loud vibrations from a BADLY unbalanced disc. If this behavior is not occurring, then this update is not needed. This application is not required for any other Macintosh systems or CD-ROM drives.

Mac OS: Cannot Disable RAM Disk

I am trying to disable a RAM disk in the Memory control panel but the On/Off radio buttons are dimmed.
This article has been archived and is no longer updated by Apple.
You can not turn off a RAM Disk when File Sharing is enabled because the disk is shared. Your Memory control panel will show the On/Off selection grayed out as shown below in Figure 1. Follow these steps to discard/disable your RAM disk:

1. Check to see if File Sharing is turned on. If so, turn it off.
2. Make sure the RAM Disk is empty by dragging any items in it to the Trash and emptying the Trash.
3. Turn off the RAM Disk in the Memory Control Panel.

Figure 1: Memory control panel.

Turning off virtual memory

DVD discs play better with virtual memory turned off. If you have problems playing a DVD disc, try turning off virtual memory. To turn off virtual memory, use the Memory control panel.

Using the Apple DVD Player Controller

If a button on the Apple DVD Player Controller is not working as you expected, keep these points in mind:

- The Controller provides some features that DVD discs may not use.
- You can only use the Next Chapter, Previous Chapter, Scan Forward, Scan Backward, Step, and Slow Motion buttons while a disc is playing.
- You cannot navigate a disc while it is paused or stopped.

To move the DVD Controller, you can drag any part of the Controller except a button.

Delays starting a DVD disc

You may notice a short delay when you start playing a DVD disc because the drive is spinning up the disc.

Using parental control

Using the Preferences dialog box, you can set the Parental Control preference to any Motion Picture Association of America (MPAA) rating: G, PG, PG-13, R, NC-17. If a DVD disc supports the parental control feature, you cannot play the disc if its MPAA rating is for a more mature audience than the rating you selected in the Preferences dialog box.

If parental control is turned on, some DVD discs display a message to which you must respond to play the disc.

Some DVD discs may not play unless you set the Parental Control preference to the MPAA rating of the disc. For example, a G-rated disc may not play even though the Parental Control preference is set to PG-13. To play the disc, set the Parental Control preference to the rating of the DVD disc.

Continuing after the FBI warning appears

Some DVD discs use a still picture for the FBI warning. If a disc appears to pause when the FBI warning appears, press the Return or Enter key to continue playing the disc.

Selecting language preferences

Many DVD discs provide the soundtrack and subtitles in several languages. You can select the default language for the soundtrack and subtitles by choosing Preferences from the Edit menu.

Your default language preferences for the soundtrack and subtitles become effective when you start playing the disc again or when you quit and open Apple DVD Player again.

Because the soundtrack and subtitle languages provided on DVD discs can vary, the default language you select may not be available on a specific disc. In this case, use the disc's interactive menus to select a soundtrack or subtitle language.

Leaving the DVD disc menus showing

If you leave the interactive menus of a DVD disc showing for more than 10 minutes, you may need to start the disc again.

Selecting disc menu options using the keyboard

Some DVD discs do not support making selections in the disc's interactive menus using the mouse. Buttons in the disc's menus may not highlight when the mouse passes over them or they may not respond to mouse clicks. If you cannot use the mouse to make selections in a disc's menus, use the arrow keys to highlight a button, then press the Return or Enter key to select it.

Opening Apple DVD Player Help

If you have 32 megabytes (MB) of random-access memory (RAM) installed in your computer, you may need to turn on virtual memory to open the Apple DVD Player Help. To turn on virtual memory, use the Memory control panel.

Improving viewing quality

For the best viewing quality for your display, choose Normal Size from the Video menu.

If you choose Fill Screen from the Video menu, you may have acceptable viewing quality as well.

With widescreen titles, the black bars above and below the image are normal, even if you choose Fill Screen.

Viewing quality is optimized for screens that are 800 x 600 pixels or larger and display 256 or more colors.

If you are using a Power Macintosh G3 computer, choose the "Best for Video" option from the TV Mirroring portion of the Control Strip for the best display of DVD video on a television.

Using the entire display

To use the entire display to view a DVD disc, choose "Present Video on Screen" from the Video menu then choose Fill Screen.

If you are using a Power Macintosh G3 computer, choose the Overscan option from the TV Mirroring portion of the Control Strip to obtain the largest possible image on your television.

Connecting your computer to another monitor, television, or stereo receiver

DVD discs are designed to work only on your computer's display, or a television or NTSC monitor attached to the video output port on your computer. If your Macintosh has either an RCA (composite) or S-Video NTSC output port, you can display DVD discs on an external monitor or television that has a composite or S-Video input port.

Note: You need to provide the necessary cables to connect your computer to an external monitor or television.

The optimum resolution for viewing DVD video on a television is 720 x 480 pixels.

If you are using an external monitor, you cannot view the disc on both the primary and the external monitor at the same time.

Using external speakers

Because soundtracks for theatrical release movies are mixed for presentation in theaters, they have a wide dynamic range and the difference in volume between dialog and sound effects may be extreme. To fully appreciate the soundtrack of such a movie when viewing it on a DVD disc, you should use an external speaker system connected to the audio output port (stereo mini-jack) or, if available, the RCA audio jacks on your computer.

Note: You need to provide the necessary cables to connect your computer to external speakers or a stereo system.

You can control the volume of the audio output port using the DVD Controller or the Control Strip.

The RCA audio outputs are for use with a stereo receiver or other audio device with its own volume control. You cannot control the volume of the RCA audio outputs using the DVD Controller or the Control Strip.

You may find that stereo headphones connected to the audio output port provide an acceptable listening experience.

The audio output port (stereo mini jack) of the Macintosh can be connected to your TV or stereo receiver if it has audio input jacks.

Turning off sleep

If your computer goes to sleep while playing a DVD disc, the Apple DVD Player will quit when you wake up your computer. You must open the application again and start playing the disc from the beginning, not from where you left off when the computer went to sleep.

To prevent this, you may want to turn off sleep. To turn off sleep, open the Energy Saver control panel and move the option labeled "Put the system to sleep after it has been idle for" to Never.

Receiving error messages while playing a disc

DVD discs are susceptible to problems due to scratches, dust, and imperfections in disc manufacture. In addition, differences in disc authoring can result in errors in disc navigation. If you see an error message when playing a disc or experimenting with the features of a particular DVD disc, make sure the disc is clean and free of scratches. If you continue to see the same message, use the disc's interactive menus to select options.

In addition, some delay is normal when playing dual layer DVD discs if the disc changes to a track on a different layer.

Compatibility issues for Power Macintosh G3 users

If you are using a Power Macintosh G3 computer, you may experience compatibility problems between the Apple DVD-Video and Audio/Video Card and other hardware and software installed in your computer.

Apple Remote Access 2.1 software

Apple/Global Village modems can be slow to shut down with the Apple Remote Access 2.1 software. If the software is set to answer calls on a Apple/GV 56k modem, up to twenty seconds may be added to the time of a shutdown command. That delay goes up to over a minute if the modem is not installed.

Apple Telecom software

Installing Apple Telecom software for GeoPort/Express modems will remove the Internal Modem sound source option from the Control Strip. Removing the Apple Telecom software will not restore this option.

PlainTalk software

Apple's PlainTalk speech recognition software is not compatible with the Apple DVD-Video and Audio/Video Card.

Mention of third-party products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Apple assumes no responsibility with regard to the performance or use of these products.

USB Printers: Serial Port in Use or -192 Error

After installing the printer software for a USB printer;

- An alert may occur during startup stating that the software needed to use the device could not be found
- An alert that AppleTalk is active and the serial port is in use may occur after selecting the printer icon in the Chooser
- A -192 error (resource not found) may occur when trying to print

This article has been archived and is no longer updated by Apple.
These symptoms are common when attempting to use serial printer software with a USB printer.

Manufacturers, such as Epson America, frequently provide both kinds of software for their USB printers that support both kinds of connections.

Though Macintosh computers with USB ports, such as the iMac and Power Macintosh G3 (Blue and White), do not have serial ports, serial printer software can nevertheless be installed.

Users are advised to carefully examine the instructions accompanying their printer software to ensure that it is appropriate for a USB printer connection, not a serial one. If in doubt, contact the manufacturer, who will typically make both types of printer software available on the Internet. Be careful to download only the USB version, not the serial version that may be listed adjacent to it.

Important: The serial port in use alert is a very good sign that the wrong type of printer software is in use, but the other alerts may also stem from other causes, such as damaged, missing, or partially installed printer software.

iMac: Warranty Implications of Expansion Card Installation

What is Apple's policy on the installation of expansion cards into iMac?
This article has been archived and is no longer updated by Apple.
Several third-party developers have recently introduced iMac expansion cards. This has prompted questions about Apple's policy regarding the installation of cards into iMac, and if the use of these cards might void the customer warranty.

Apple will not provide repairs under warranty to iMacs that have been damaged due to the installation of any expansion card (including SDRAM and SGRAM cards), whether the card was installed by an authorized service technician or the customer.

Currently, the only cards that may be installed in iMac are SDRAM memory and SGRAM video memory cards in the iMac memory slots. Besides these two slots, there is an additional slot that was used by Apple during iMac development (often referred to as the mezzanine slot). This slot is for Apple use only. Apple has not published the specifications for this slot and is not recommending that any company develop products that rely on it.

Mac OS 8.5: Sherlock Error Accessing Browser

When using Sherlock to find information on the internet, I get an error when I click on any of the returned web links. The error states: An unexpected error occurred attempting to access your browser.

My browser works fine if I use it separately. What could be causing this error?

This article has been archived and is no longer updated by Apple.
There are a few possibilities for the root cause of the error. Before trying the following steps, ensure that the Internet Config 2.0 extension is installed in your Extensions folder. Then verify that you have selected the appropriate browser in the Internet control panel under the Web tab. If those two items are verified, then follow these troubleshooting steps:

1. Boot using your Mac OS 8.5 CD.

2. Delete the Find preferences in the Preferences folder inside your system folder.

3. Reboot from the hard drive and retry a Sherlock search. If the problem persists, continue on.

4. Reboot from the Mac OS 8.5 CD and do a custom install of Sherlock.

5. Reboot from the hard drive and retry a Sherlock search. If the problem persists, continue on.

6. Reboot from the CD, delete the Internet preferences from the Preferences folder inside your system folder and reboot. By deleting the Internet preferences, you will have to reconfigure some basic internet preferences such as your default browser, signature files, etc. As such, this should be your last step.

iMac, Cube, G4: Restarts Instead of Shutting Down

This article describes conditions that may cause an iMac, Power Mac G4 Cube or Power Mac G4 computer to restart instead of shutting down.
This article has been archived and is no longer updated by Apple.

Symptom

The iMac, Power Mac G4 Cube or Power Mac G4 computer may restart instead of shutting down.

Solution

This could be caused by a USB device attached to the computer, an extension conflict, or an item in either the Startup Items or Shutdown Items folder.

Follow these steps to verify:

Disconnect all USB devices (including keyboard and mouse and any USB hubs) and power down the computer as follows:

- iMac - use the front power on/off button to power down.
- Power Mac Cube - hold down the power button for about 5 seconds to power down.
- Power Mac G4 - remove the keyboard and connect a known good Apple Pro Mouse and shutdown the computer via the special menu.

- If the computer shuts down without restarting, it is likely the fault of one of the USB devices. Connect each USB device one by one and repeat the shutdown process until you identify which USB device is causing the fault. After identifying the suspect USB device, contact the vendor of the USB device for further instructions on resolving the issue.

-If the computer continues to restart even after disconnecting all USB devices, then it could be caused by an extension/control panel conflict, or an alias in the Startup Items or Shutdown Items folder. Remove any items in the Startup Items or Shutdown Items folder. Restart the computer and shutdown to see if this was the issue. if the computer continues to restart then make sure the issue is not caused by and extensions conflict.

See article 30929: "**Mac OS: Extension Conflict Troubleshooting/Extensions Manager Features**"

- If the computer continues to restart, then it could be related to the computer. In this case, start up from the Software Install CD included with your computer. Once your computer has finished starting up, shutdown the computer.

If the issue goes away, reinstall your system software. If the issue continues, reset the PRAM by holding "Command-Option-P-R" on startup. For additional information on resetting the PRAM, see article 2238: "**How to Reset PRAM and NVRAM**".

If you are still unable to resolve the issue, contact Apple or an Apple Authorized Service Provider for additional assistance.

iMac: CD Firmware Update Required For Some M6709LL/B Models

The CD Firmware Update is still required for some early M6709LL/B (Rev. B) iMac.
This article has been archived and is no longer updated by Apple.
If you are experiencing loud vibrations from the internal CD-ROM Drive when using certain CD titles, only then should you should install the update. After you run the update, the amber drive activity light will be disabled.

This update is available online from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Apple Modem Updater 2.0: Confirming Installation

This article explains how to verify that the Apple Modem Update 2.0 was installed properly.
This article has been archived and is no longer updated by Apple.
The instructions in this article can be used to confirm the installation of the Apple Modem Update for all iMac, PowerBook G3 Series or later, and Power Macintosh G3 (Blue and White) or later computers.

There are three methods for verifying the update was installed.

Method 1

1. Open the Apple Modem Updater application program again.

2. If the modem ROM was updated, it returns the following message in the status window: "This updater contains the same firmware as the modem. Check www.apple.com/support for a more current version of Apple Modem Updater.

Method 2

1. Open Apple System Profiler.

2. The System Profile tab contains an item named Network Overview. Click the Network Overview disclosure triangle to reveal the modem information.

3. If the Apple Modem Update has been successfully installed the modem version information should show "V2.300-V90."

Method 3

Using a terminal program, enter the following command and press the Return key.

```
ati3
```

If the modem's firmware has been updated, the following information is returned:

```
V2.300-V90_2M_DLS

OK
```

If the modem firmware has not been updated, the following is returned:

```
V2.100-V90_2M_DLS

OK
```

or

```
V2.200-V90_2M_DLS

OK
```

Note: Apple Remote Access is included with Mac OS and can be used if you do not have a terminal program. For information on using Apple Remote Access for this purpose, please see article 24775: "**Remote Access: Using the Terminal Window to Send AT Commands**"

About iMac Firmware Update 1.1

This article contains the Read Me for the iMac Firmware Update 1.1, as well as other relevant information. This software was released by Apple on 18 December, 1998 and is available for downloading from the Apple Software Update web site at **http://www.apple.com/swupdates**.
This article has been archived and is no longer updated by Apple.

What is iMac Firmware Update?

iMac Firmware Update is based on customer feedback, and increases the reliability of iMac booting. It is being provided to every iMac customer as preventive maintenance. The iMac Firmware update upgrades the Open Firmware boot ROM code using a simple application downloadable from Apple's web site.

Who needs the iMac Firmware Update?
Every iMac customer should install this update. This update will only install on iMac computers.

What are the requirements for installing iMac Firmware Update?
This update can be installed on any iMac worldwide. Currently, the instructions for installing are available only in U.S. English but localized installers will be available soon for other languages, including International English, Spanish, German, French, Swedish, Italian, Japanese. Steps were taken to make this update as simple as possible so that most iMac customers worldwide could download and install this version.

What specifically does iMac Firmware address?
The update provides three enhancements:

1. Enhanced file system support
The new firmware supports all of the extent and extent overflow fields of the HFS/HFS+ file structure. Without this, it was possible for the Mac OS ROM file to stored in the extent and extent overflow fields of the HFS/HFS+ file structure which would prevent the iMac from starting up. In cases where this occurs, all of the data on the hard disk is still preserved, but the iMac won't be able start up from the hard disk until the iMac Firmware updater is run. This issue is extremely rare, but certainly important to address.

2. Dual-image boot ROM
The iMac Firmware update installs a second boot ROM image within the flashable ROM. Should there ever be a future firmware update, the second image serves as a backup should the firmware update fail. Although a firmware update failure is highly unlikely, providing the second image would allow the iMac to start up.

3. Hardware protection
After installing the iMac Firmware Update, Rev/A iMac computers will be hardware protected against unintentional firmware updates. Like iMac Rev/B units, the NMI Programmer button or Interrupt button will need to be depressed (using a paperclip) prior to starting up iMac to enable the firmware to be updated. This prevents a firmware update from occurring unintentionally.

How do I obtain the iMac Firmware Update?
Apple is providing iMac Firmware Update at no charge through the Internet. It can be downloaded from the Apple Software Update web site at **http://www.apple.com/swupdates**.

Will Apple be delivering iMac Firmware Update on CD-ROM?

No. Customers should obtain the update through Apple's Software Updates web site.

How large is the downloadable iMac Firmware Update file?
The update is provided in compressed format and incorporates a self-check mechanism to verify that the file has been downloaded completely and without error. The compressed downloadable file is about 1 MB in size.

How to Install the Firmware Update

The following instructions are included in the Read Me file for the Firmware Update. Depending upon if you have a /A or /B iMac, there is one key difference in how you install the update: /B iMac customers must use a paper clip to depress the iMac Programmer's button for approximately five seconds after restart. A long tone will sound at which time the Programmers button may be released.

Note: After you upgrade the firmware, the PRAM will be reset which may require you to reset some iMac preferences. Refer to the Mac OS Help for details about what items will need to be reset. For example, you need to open the Startup Disk control panel and reselect your hard disk.

1. Double-click the iMac Firmware Updater icon to start the update.

2. Read the onscreen instructions and follow them carefully.

3a. On a /A configuration, a message will appear explaining that your iMac's firmware needs to be updated. Click the Update button and follow any further on-screen instructions.

Figure 1, Update message for /A configuration

3b. On a /B configuration, a message will appear saying you need to shut down your computer and insert the end of a straightened paper clip into the Programmer's button hole, follow steps 4-8 to complete the update process.

Figure 2, Update message for /B configuration

4. Click Shut Down in the dialog box to shut down your computer.

5. Open the port cover door on the right side of your iMac and insert the end of a straightened paper clip into the Programmer's button hole, the lower of the two small button holes.

Figure 3, Location of Programmer's button hole

6. Continue to hold the paper clip in the hole and press the Power button on your iMac, or on the Apple USB keyboard to start up your iMac.

7. When you hear a long tone, remove the paper clip. A progress bar will appear at the bottom of the screen as the update takes place.

8. After successfully applying the firmware update the iMac will, upon restart, momentarily display a flashing question mark transposed on a folder icon. Once the iMac has fully restarted, use the Startup Disk control panel to set the internal hard drive as the startup disk. This action is necessary to prevent delays during the startup process.

Error Checking Prior to the Installation

A number of conditions are required before the update will be performed. Failure to meet these conditions will result in an error condition indicated by on screen dialog boxes. Conditions which will prevent successful installation of the update are:

- If the updater file has been moved outside of the folder containing the update installer
- If the updater is used on a computer other than an iMac
- If a Mac OS error #123 occurs
- If the volume is locked
- If the firmware is not recognized
- If the hard drive has less than 2.5 MB of free space

Any of these conditions will generate an error dialog box which offers the user the appropriate option to recover from the condition.

Conditions that May Cause the iMac Firmware Updater to Fail

There are other conditions that may cause the updater to fail.

- If power is removed during the update, the Boot ROM may become corrupted and not retrievable. The processor board will have to be replaced.
- If a /A configuration is restarted using the paper clip by mistake, the update will not complete. Power must be pulled for 15 seconds and the update attempted again.

Note: The open firmware command line is not used in this firmware update process. Any attempts to update iMac's firmware using the command line mode may lead to BOOT ROM corruption and require that the processor board be replaced. Modifications of the iMac open firmware using the command line mode is not supported and any resulting damage to the processor board may not be covered under warranty.

How to Determine If a System Has Already Been Updated

The Firmware Update installer will verify that the update is required before installing it and will display a dialog if the update is not required. If you are unsure if your systems have been updated, simply run the Update installer.

Power Macintosh G3 (Blue and White): Isochronous Protocol Support on USB?

What is Isochronous protocol and does Power Macintosh G3 support it on the USB bus? What are the differences between iMac USB support and that of Power Macintosh G3?
This article has been archived and is no longer updated by Apple.
Power Macintosh G3 will not initially support isochronous transfers, though it is possible in the future.

Pronounced eye-sock-ra-nuss, it refers to processes where data must be delivered within certain time constraints. For example, multimedia streams require an isochronous transport mechanism to ensure that data is delivered as fast as it is displayed and to ensure that the audio is synchronized with the video.

Power Macintosh G3 (Blue and White): Video Adapter Necessary for Headless Operation

This article discusses headless operation of a Power Macintosh G3 (Blue and White).
This article has been archived and is no longer updated by Apple.
If you are planning to run your Power Macintosh G3 headless, you should use the video adapter, part number 590-1120-A, which was included in your accessory kit. This spoofs the video card into thinking a video display is attached. When the time comes to connect a display, simply connect it to the adapter, or remove the adapter and connect the display directly to the card, as appropriate.

Be aware that if your display requires an ADB connection for full functionality, you must shut down the computer, connect the display and ADB cables, then restart the computer. A display which uses USB likely does not require a restart because USB is a hot-swappable technology.

Power Macintosh: Differences Between DVD-ROM, DVD-RAM, and DVD-RW

This article explains the differences between DVD-ROM, DVD-RAM, and DVD-RW.
This article has been archived and is no longer updated by Apple.
DVD-ROM, as its name implies, is a "read-only memory" format. Your computer can read a disc's contents, but it cannot save data to one.

DVD-RAM (DVD random-access memory) and DVD-RW (DVD rewritable) are both rewritable mediums. Both DVD-RW and DVD-RAM are rewritable DVD standards that have been published by the DVD Forum, a group of more than 200 industry-leading corporations (http://www.dvdforum.org/).

See technical document 42718 "**SuperDrive: About Rewriteable DVD Discs**" for additional discussion of DVD-R, DVD-RW, DVD-RAM, and DVD+RW.

Obtaining Ethernet Status With Apple System Profiler

You can use Apple System Profiler to determine the status of your computer's Ethernet connection.

This article has been archived and is no longer updated by Apple.
Apple System Profiler version 2.1.2 (and later) has the ability to indicate Link up or down, Half or Full duplex, as well as 10 megabit or 100 megabit connection speed.

The Network overview section in the main Apple System Profiler window has a field labeled Link that gives this information.

Note: If the Ethernet port is not connected to a live Ethernet connection, Apple System Profiler indicates Link down, and all other options are indicated as n/a.

Power Macintosh G3 (Blue and White): Storage Options and Support

This article discusses the options and specifications for storage devices in Power Macintosh G3 and Power Macintosh G3 (Blue and White) computers.
This article has been archived and is no longer updated by Apple.
The Power Macintosh G3 has a total of 5 locations, or bays, for storage devices. The two externally accessible bays in the front panel are designed for a ZIP drive and a CD-ROM drive. There are three internal locations on the bottom of the enclosure for hard drives. Power is supplied for all three drive bays, but only the startup drive has a data cable supplied.

The Power Macintosh G3 computer does not include a floppy drive.

Logic Board Drive Connectors
There is an Ultra DMA/33 (ATA-4) interface to support the startup drive only, and an ATA-3 interface for CD-ROM and Zip drives. The enclosure includes data and power connectors for the Ultra DMA/33 (ATA-4) startup drive, an optional internal ATAPI CD-ROM, or DVD-ROM drive, and an optional internal ATAPI ZIP drive.

Later revisions of the Power Macintosh G3 (Blue and White) provide support for dual IDE drives. They can be identified by the presence of a U bracket installed in the rear most drive bay which allows two hard drives to be mounted in that single bay.

The ATA-3 channel supports two ATA devices. The devices are configured in a ATA Device 0/1 configuration. The ATAPI CD or DVD-ROM, and Zip drive, when installed, occupy both device locations on the ATA-3 channel. The ATAPI CD or DVD-ROM, depending on which is installed, is Device 0 (master), and the Zip drive is Device 1 (slave).

The Ultra DMA/33 bus supports PIO Mode 4, DMA Mode 2, and Ultra DMA Mode 2 data transfers. The ATA-3 bus supports PIO Mode 4 and DMA Mode 2 data transfers.

Ultra DMA/33 Hard Drive
The logic board supports an internal hard drive that uses the standard Ultra DMA/33 (ATA-4) interface. The internal hard drive has a 40-pin connector and a separate 4-pin power connector. An 80-conductor high-density cable with a 40-pin connector is attached to the main logic board. A separate ground is provided on the 80-conductor cable for each of the signals on the 40 pin connector to provide improved signal quality. The power cable is attached directly to the power supply.

ATAPI CD-ROM Drive
The Power Macintosh G3 computer has a 24X-speed internal ATAPI CD-ROM drive. The CD-ROM drive supports the worldwide standards and specifications for CD-ROM and CD-digital audio discs described in the Sony/Philips Yellow Book and Red Book. The drive can read CD-ROM, CD-ROM XA, CD-I, and PhotoCD discs as well as play standard audio discs.

The CD-ROM drive has a sliding tray to hold the disc. The drive features a mechanism that supports 4X, 8X, 12X, and 24X data transfer rates and a data buffer that further enhances performance. The CD is configured as device 0 in an ATA Device 0/1 configuration.

Optional ATAPI Zip Drive
The Zip drive is an ATAPI drive and is connected as device 1 in an ATA Device 0/1 configuration on the ATA-3 channel of the main logic board.

Optional DVD-ROM Drive
The optional DVD-ROM drive is fully compatible with existing CD-ROM media. The drive supports CD-ROM at 32x speed maximum and DVD at 5x constant linear velocity (CLV). The DVD-ROM drive supports the following disc formats:

* DVD-ROM (One- or two-layer, one- or two-sided)
* CD-ROM (Modes 1 and 2), CD-ROM XA (Mode 2, Forms 1 and 2), CD-Audio, Photo CD, CD-RW, CD-R, CD-Extra
* CD-I (Mode 2, Forms 1 and 2), CD-I Ready, CD-I Bridge
* Video CD

Optional Ultra2 SCSI (LVD) Drive
An Ultra2 SCSI low-voltage differential (LVD) drive and Ultra2 SCSI PCI controller card are available as a configuration option. The Ultra2 SCSI interface provides data transfer rates of up to 80 MB per second.

Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White) Expansion Ports: Description

What external expansion ports are available on the Power Macintosh G3?
This article has been archived and is no longer updated by Apple.

Figure 1: Power Macintosh G3 (Blue and White) ports.

Line Voltage
The power supply is not self-configuring for different input voltages. The voltage switch is delivered preconfigured for the input voltage of the region in which the unit is originally purchased. If the computer is moved to another location where the input voltage is different, the voltage switch must be adjusted to accommodate the voltage change. The switch has two positions that support voltage ranges of 100 to 130 V or 220 to 270 V.

Monitor Power
The monitor power socket is not switched. Any time power is connected to the power supply, power is available on the monitor power socket. A monitor that does not support energy saving features that is connected to the monitor power socket will not power off when the computer is shut down. Monitors that do not support energy saving features have to be switched manually.

10/100 Ethernet

Figure 2: 10/100 Ethernet marking

The Power Macintosh G3 computer has an auto-switching 10 or 100 Megabit Ethernet. This port only accepts twisted pair Ethernet cables (also called 10 Base-T).

USB Ports and Devices

Figure 3: USB Ports and Devices marking

The USB ports take the place of the serial I/O ports found on earlier Macintosh computers. Software shims have been implemented in the system software to allow existing applications that use ADB devices to work with USB devices. The Power Macintosh G3 computer uses a USB keyboard and mouse similar to the USB keyboard and mouse introduced with the iMac computer. USB game controllers are supported by the InputSprocket component of the Apple Game Sprockets software architecture. InputSprocket software and information about the InputSprocket APIs can be found at: http://developer.apple.com/dev/games/

FireWire

Figure 4: FireWire marking

The Power Macintosh G3 has two FireWire ports for connecting high speed peripherals such as cameras, scanners, disk drives, or home entertainment systems. At 200 Mbps, it is up to 20 times faster than an Ethernet network connection. Here are some other benefits:

- Ability to daisy chain up to 63 devices to your Mac or PC (with connecting cable lengths of up to 14 feet).
- Hot-pluggable so you do not have to turn off a scanner or CD drive to connect or disconnect it, and you do not need to restart your computer once you have made the connection.
- FireWire devices are easy to connect (you do not need device IDs, jumpers, dip switches, screws, latches or terminators).

Apple Desktop Bus (ADB)
One ADB port is included, for attaching ADB devices such as keyboards and mice.

Sound In/Sound Out
There is a sound in port and a sound out port. These ports can be used to connect with external microphones and speakers.

No SCSI Ports
The Power Macintosh G3 computer does not include built-in internal or external SCSI device connectors. Adding an internal or external SCSI device requires the use of a SCSI PCI card. Ultra2 SCSI (LVD) devices and PCI controller cards will be available as options at the time of purchase.

No LocalTalk Serial Ports
The Power Macintosh G3 computer does not include RS-422 serial ports found on earlier Macintosh models. I/O for external devices is provided by two USB ports. USB adapters are available from third parties to support Macintosh compatible legacy serial devices.
Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White): Sound Capabilities

This article discusses the sound capabilities of the Power Macintosh G3.

This article has been archived and is no longer updated by Apple.
The Power Macintosh G3 is not configured as a typical AV style Power Macintosh in that it does not have RCA jacks for sound in and out, nor additional video in and out ports. Instead, it relies on external FireWire devices for providing advanced audio/video capabilites.

Here are the details relating to the sound capabilities of the Power Macintosh G3 logic board:

Sound System
The sound system for the Power Macintosh G3 computer supports 44.1 kHz 16-bit stereo sound output and input, available simultaneously.

Like other AV class Macintosh computers, the sound circuitry and system software can create sounds digitally and either play the sounds through the speaker inside the enclosure or send the sound signals out through the sound output jack. The Power Macintosh G3 computer also records sound from several sources: an analog sound source connected to the line-level sound input jack, analog sound from the modem card connected to the internal modem connector, or a compact disc in the CD-ROM player. With each sound input source, sound playthrough can be enabled or disabled.

Sound Output
The Power Macintosh G3 computer provides one 3.5-mm mini jack for sound output on the back of the enclosure. The output jack is connected to the sound amplifier; the mini jack is intended for connecting a pair of headphones or amplified external speakers. Inserting a plug into the sound output mini jack disconnects the internal speaker. The enclosure has one built-in speaker.

The Burgundy IC provides the stereo sound output to both the internal speakers and the sound output jack. The sound output jack has the following electrical characteristics:
* output sound signal to noise ratio (SNR) <90 dB unweighted (typical) when sound playback is from system hard disk or main memory .
* output sound SNR <80 dB unweighted (nominal) when playback is from CD .
* overall output sound SNR <90 dB unweighted (typical).

Sound Input
The Power Macintosh G3 computer provides a stereo sound input jack on the back of the enclosure for connecting an external PlainTalk microphone or other sound source. The sound input jack accepts a standard 3.5-mm stereophonic phone plug (two signals plus ground).

Note: The Apple PlainTalk microphone requires power from the main computer, which it obtains by way of an extra-long, 4-conductor plug that makes contact with a 5-volt pin inside the sound input jack.

The sound input jack has the following electrical characteristics:
* input impedance: 20 kW
* maximum input level without distortion: 2.5 V peak to peak (Vpp) maximum
* line-level microphone voltage range of 0.28 V to 2.1 V peak to peak
* input SNR <90 dB unweighted (typical) for recording to system hard disk drive or system main memory

Digitizing Sound
The sound circuitry digitizes and records sound as 44.1 kHz 16-bit samples. If a sound sampled at a lower rate on another computer is played as output, the Sound Manager transparently upsamples the sound to 44.1 kHz prior to outputting the audio to the Burgundy sound IC.

The preferred sound sampling rate for output is specified in the Monitors and Sound control panel when the sound input is not in use. The preferred output sampling rate is overridden by the setting of the input sampling rate, because the input and output sampling rates are physically locked together. The sound output sampling rate is always 44.1 kHz.

When recording sound from a microphone, applications that are concerned about feedback should disable sound playthrough by calling the Sound Manager APIs.

The Burgundy IC provides separate sound buffers for input and for stereo output so that the computer can record and send digitized sound to the sound outputs simultaneously.

Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White): Power Remains On When Case Is Open

You can access the logic board of Power Macintosh G3 and Power Macintosh G3 (Blue and White) computers without unplugging the power cord. It is possible for the computer to stay powered on when the case is open.

This article has been archived and is no longer updated by Apple.
If the computer is in a powered on state and the side panel is opened to access the logic board, the computer remains powered on.

You are strongly discouraged opening the case with the computer powered on. If this is unavoidable, then it should not be operated in that state for extended periods. With the case open, there is not sufficient airflow over the G3 processor and the computer could enter a thermal shutdown. Any data not saved would be lost.

Do **NOT** perform any upgrades to the Power Macintosh G3 with the power on. Make sure the computer is powered off and the power cord disconnected before performing any upgrade to the logic board of your computer.
Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White) and G4: No Support For Hard Drive in Zip Drive Expansion Bay

The Zip drive bay in a Power Macintosh G3, Power Macintosh G3 (Blue and White), or Power Mac G4 computer is not designed to accommodate a hard drive or optical drive.
This article has been archived and is no longer updated by Apple.

Products affected

- Power Mac G3 (Blue & White)
- Power Mac G4 (PCI)
- Power Mac G4 (AGP)
- Power Mac G4 (Gigabit Ethernet)
- Power Mac G4 (Digital Audio)
- Power Mac G4 (QuickSilver)
- Power Mac G4 (QuickSilver 2002)

The drive bay is reserved exclusively for a Zip drive. A hard drive generates additional heat and has not been certified for use in the Zip drive bay. Other 3.5-inch height removable ATA-3 drives may be compatible. Check with the vendor of the drive for compatibility information and technical support.

Optical drives (CD-ROM, DVD-ROM, DVD-RAM, DVD-R, CD-RW) are 5.25-inch devices and cannot physically fit in the 3.5-inch Zip drive bay and are also not supported.

Additional hard drives are intended to be mounted on the bottom of the case and require a SCSI card. Only Power Macintosh G3 (Blue and White) and Power Mac G4 computers with the U bracket in the hard drive expansion bay and a dual connector IDE cable can support two IDE drives in master and slave configuration. If the computer did not come with the dual connector IDE cable and U bracket, then additional hard drives are intended to be mounted on the bottom of the case and require a SCSI card.

For further information, refer to article 58193: "**Power Macintosh G3 (Blue and White): Additional Hard Drive Installation Options**".

Power Macintosh G3 (Blue and White): How to Differentiate From Other Power Macintosh G3 Models

This article tells how to differentiate between the various Power Macintosh G3 computers.

This article has been archived and is no longer updated by Apple.
Before January of 1999, there were three Power Macintosh G3 form factors useful for visual identification; Desktop, Minitower, and All-in-one. At the MacWorld Exposition in January, 1999, Apple introduced a Power Macintosh G3 model which does not fit into any of the previous categories.

While it is a tower design, Apple has elected not to refer to it as such. For the purpose of identification, Knowledge Base articles will refer to this design by its colors (blue and white) rather than form factor.

Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White): Which SCSI Card to Use with Slower SCSI Devices

This article recommends which Apple SCSI card to use with SCSI peripherals of various speeds.

This article has been archived and is no longer updated by Apple.
The Apple Ultra SCSI PCI Card, available as a Build to Order option, is best suited for using older and slower external SCSI devices such as tape drives, scanners, and hard disks with your Power Macintosh G3 computer or Macintosh Server G3. You can also connect standard SCSI (SCSI-1), Fast SCSI (SCSI-2), and Ultra SCSI (also called Ultra Narrow SCSI) peripherals to the Apple Ultra SCSI PCI card. With the card installed in your computer, you can also start up the computer from externally connected drives. The Apple Ultra SCSI PCI Card includes a 50- to 25-pin cable adapter.

This economical and convenient option lets you connect up to seven SCSI devices, as long as the total cable length measures no more than 6 meters, or about 18 feet. The card supports cable lengths of 1.5 meters when running in Ultra SCSI mode or 6 meters when running in SCSI-1 or SCSI-2 mode.

Here is a list of applicable transfer rates for the various SCSI modes.

SCSI Mode	**Speed**	**Connector**
SCSI (SCSI-1)*	5MBps	25- and 50-pin
Fast SCSI (SCSI-2)*	10MBps	25- and 50-pin
Fast Wide SCSI	20MBps	50-pin
Ultra SCSI*	20MBps	50-pin
Ultra Wide SCSI	40MBps	68-pin
Ultra2 LVD SCSI	80MBps	68-pin
*Supported by the Apple Ultra SCSI PCI Card.		

Different types of SCSI devices connected to a SCSI channel operate only as fast as the slowest device on the chain. For example, a SCSI-2 (10MBps) tape drive and a SCSI-1 (5MBps) hard disk on the same SCSI channel will both operate at 5MBps.

The Apple Ultra SCSI PCI Card is functionally equivalent to the Adaptec Power Domain 2930 Ultra SCSI card.

Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White): PCI Expansion Slot Specifications

This article provides information on the four PCI expansion slots contained within the Power Macintosh G3.
This article has been archived and is no longer updated by Apple.
The Power Macintosh G3 has four PCI slots. There are actually two different PCI busses on the computer; they are:

1 - 66 MHz PCI Bus with one PCI Slot which accepts a 66 MHz 32-bit PCI card.
1 - 33 MHz PCI Bus with three PCI Slots which accept 33 MHz 32-bit or 64-bit cards.

The 66 Mhz PCI bus includes slot #1, which accommodates only 66 MHz 32-bit PCI cards. However, this slot is always configured from Apple with an Apple 2D/3D accelerated graphics card.

The 33 MHz PCI bus includes slots #2, #3, and #4, which accommodate both 32-bit and 64-bit 33 MHz PCI cards. These slots accept standard 7-inch and 12-inch PCI cards.

Some rules to remember about these slots:

- The 66 MHz PCI slot accepts only 66 MHz cards. The slot is keyed differently than 33 MHz cards and does not have the extra long slot for 64-bit cards.
- The 33 MHz PCI slots (3 of them) accepts only 33 MHz cards (not 66). These slots are longer than previous PCI slots to accommodate 64-bit cards. Older PCI cards work in these slots even though the extra section of the slot is not used.
- You can use the three 33 MHz expansion slots to install:
  three 15 W cards
  one 15 W or 25 W card
  two 15 W or 25 W cards
  one 15 W card and one 25 W card

  The illustration below shows the card differences between these slots. Note that key for the 66 MHz slot is located in a different place than other slots. The key is the slot which is cut into a PCI card. The key is shown below as the white gap between the gray parallel lines. The leading edge of slot is where the end of the card would be, facing the rear of the computer.

Figure 1, Differences between PCI slots.

iMac 266: Why No IrDA?

I noticed that the new iMac 266 no longer has IrDA support. Why was this removed?
This article has been archived and is no longer updated by Apple.
Based on the success of USB, Apple has decided that for desktop computers, such as iMac, we will focus on USB as the way devices connect.
Published Date: Feb 20, 2012

iMac 266: No Mezzanine Connector

Some third party companies have been advertising iMac expansion cards for the Mezzanine connector. Will these cards function in the iMac 266?
This article has been archived and is no longer updated by Apple.
The Mezzanine connector was used during the development and manufacture of iMac. It is no longer needed and therefore has been removed from the iMac 266 logic board. Apple has never spoken of any product plans in conjunction with this connector and discouraged any developer planning to take advantage of it.
Published Date: Feb 20, 2012

Apple Studio Display 21: Connecting to PCI Video Card Having Two Connectors

Some earlier Macintosh video cards contain both a VGA and DB-15 Macintosh type video connector. If your video card contains both types of connectors then you should connect your Studio Display 21 to the Macintosh style DB-15 video connector using a VGA adapter.
This article has been archived and is no longer updated by Apple.
The Studio Display 21 should work with most Macintosh video cards that are DDC compliant and which support the resolutions and frequencies highlighted on the monitor's specification sheet. Connecting to the VGA connector when two connectors are present may cause display difficulties.

The Apple VGA adapter (see Figure 1) has an Apple service part number of 922-3769 and can be ordered by Apple Authorized Service Providers. The adapter has a part number of 513-0091-A molded into the grey plastic housing, and was provided with some of the early Studio Display 21 monitors.

Figure 1: VGA Adapter

As specified in the Studio Display 21 data sheet, a built-in USB port is required to use and adjust the display. The Apple display software uses the USB communication link to perform the color calibration and display adjustments.

Apple Studio Display 21 and 17: Compatibility with Other Macintosh Models

This article provides Power Macintosh compatibility information for the Apple Studio Display 21 and Apple Studio Display 17.
This article has been archived and is no longer updated by Apple.

Apple Studio Display 21

Due to the requirement of on-board USB, the Apple Studio Display 21 can be connected only to USB based computers. An earlier Power Macintosh with a USB card installed does not work with this monitor.

Apple Studio Display 17

The Apple Studio Display 17 works with all Power Macintosh desktop computers, and all PowerPC based PowerBook computers with the exception of the PowerBook Duo 2300 and PowerBook 500 series with the PowerPC upgrade card.

For additional information on connecting the Studio Display 17 to older computers, refer to article 58271: "**Apple Studio Display 17: Using With Older Power Macintosh Computers**".

The viewable image size of the Apple Studio Display 21 is 19.8 inches, the Apple Studio Display 17 has a viewable image size of 16.0 inches.

Published Date: Feb 20, 2012

Apple Studio Display 21: Do Not Daisy Chain Multiple Displays Together

If you daisy chain multiple Apple Studio Display 21-inch displays together, the Power Macintosh G3 (Blue and White) may restart itself approximately 3-5 seconds after you shut down.
This article has been archived and is no longer updated by Apple.
If this occurs, reconnect the additional displays directly to your Power Macintosh G3 (Blue and White).

Alternatively, you can use a USB hub. Although the Apple Studio Display 21"-inch is a USB hub, the four ports on the side should be used for connecting other USB devices.

The viewable image size of the Apple Studio Display 21-inch is 19.8 inches.

Published Date: Feb 20, 2012

Apple Studio Display 17: Noise or Shimmer at Startup is Normal

When starting up, an Apple Studio Display 17 may make a noise and the image may shimmer a bit before it settles down.

This article has been archived and is no longer updated by Apple.
The display is behaving normally and does not require service. What is happening is called Degaussing. Degaussing is the process of stabilizing the magnetic field of the CRT. It is a normal function of every display and does not indicate a need for service.

Waking the display from sleep or initiating a degauss from the on-screen display can also cause the same noise to be generated.

The viewable image size of the Apple Studio Display 17 is 16.0 inches.

Apple Studio Display 21/Apple Studio Display 17: Tripod Stand Safety Tips

This article provides specific safety tips relating to the new tripod stand used on the Apple Studio Display 21-inch and Apple Studio Display 17-inch displays.

This article has been archived and is no longer updated by Apple.

- Lift the display by the indentations on the under-sides near the front of the display. Never lift the display by the tripod stand.
- Likewise, do not adjust the position of the monitor by pulling the stand legs. The tripod stand is subject to damage if mishandled.
- When placing the monitor on a table surface, ensure that all three legs on the tripod stand contact a solid surface. If one of the legs is too close to the table edge, the weight of the monitor could cause the display to fall off the edge.

The viewable image size of the Apple Studio Display 21-inch is 19.8 inches, the Apple Studio Display 17-inch has a viewable image size of 16.0 inches.

Published Date: Feb 20, 2012

Apple Studio Display 17: Serial Number Placement

This article provides the location of the serial number on the Apple Studio Display 17.
This article has been archived and is no longer updated by Apple.
The serial number label is under the rear of the display, on the tripod stand.

The viewable image size of the Apple Studio Display 17 is 16.0 inches.

Power Macintosh G3 (Blue and White): Modem Alert During Initial Setup

During initial setup of a Power Macintosh G3, after selecting a country a dialog box may appear informing you to call Apple regarding the modem even though the computer does not have a modem.
This article has been archived and is no longer updated by Apple.
The dialog box shown below is generated during the initial setup of Mac OS where it would normally set the country code for the modem. This issue affects only the first production run of Power Macintosh G3 computers **without** modems, and is not an indicator of any flaw with your computer.

Simply click OK and proceed; you do not need to contact Apple support for assistance.

Figure 1, Modem problem dialog box

Power Macintosh G3 (Blue and White): Description

This article provides a description of the Power Macintosh G3 introduced at MacWorld San Francisco 1999.

This article has been archived and is no longer updated by Apple.
Fast enough to handle the toughest video and publishing applications with ease. Smart enough to grow with your needs for years to come. Stylish enough to make your computer time more enjoyable than ever. With the new Power Macintosh G3 computer, all these incredible features are yours in one great system, at one remarkably low price.

Whether you are a design professional who appreciates the marriage of beauty and power, an educator who needs performance and flexibility in a system that provides a solid investment for the future, or a home user whose family wants to run business applications, Internet programs, and games, the new Power Macintosh G3 computer is a superb choice.

At the foundation of these computers is their amazing responsiveness. With processor speeds of up to 400 megahertz, they can handle video and high-resolution graphics at lightning speed. Performance is further enhanced by a superfast system bus and a backside cache of up to 1 megabyte. And if you are a design professional or you just like games, you will love the built-in high-performance ATI RAGE 128 graphics card.

The innovative design of the Power Macintosh G3 does much more than simply make it look great. Just flip the computer open for fast access to ever ything inside. The easy-open (but lockable) enclosure lets you easily add memory, storage, or PCI cards. Built-in handles simplify moving the computer from room to room.

Speaking of expansion, the Power Macintosh G3 is one incredibly versatile computer. It comes with three available PCI slots and two Universal Serial Bus (USB) ports that support a wide variety of cards and accessories. And it features a fast FireWire bus designed especially for connecting digital cameras and other high-speed devices.

Do not forget to complement your new Power Macintosh G3 computer with a matching monitor from the Apple Studio Display series. Like the computer, these displays give you both power and style at an excellent price.

The Power Macintosh G3: Performance, capabilities, and style that will dazzle you every day you use it.

Features

Incredible performance

- PowerPC G3 processor running at 350, 400, or 450 MHz
- Support for up to 1GB of high-performance PC100 SDRAM
- 1MB of performance-boosting backside cache running at up to 225 MHz
- Support for hard disk storage up to 100GB
- Built-in 10/100BASE-T Ethernet networking
- ATI RAGE 128 graphics card with 16MB of graphics memory

Amazing capabilities

- Two high-speed FireWire ports for digital video and still cameras, printers, scanners, and other multimedia peripherals
- Two USB ports for keyboards, mice, printers, and much more
- Four PCI slots, including one dedicated graphics PCI slot with ATI RAGE 128 graphics card

Stunning design

- Elegant translucent case that matches Apple's latest displays
- Outstanding accessibility for installing cards, drives, and memory
- Attractive, convenient handles for easy carrying

Related Products

-Apple Studio Display (15-inch); order no. M6356

-Apple Studio Display (17-inch); order no. M6221

-Apple Studio Display (21-inch); order no. M6204

- Apple 56K V.90 Internal Modem; order no. M7405

- Third-party USB peripherals

-Imation SuperDisk floppy disk drive

-Farallon iPrint LT Adapter

-Kodak DC220 and DC260 digital cameras

For a list of compatible third-party USB products, visit Apple's Product Web Site, Universal Serial Bus Web Page: **http://www.apple.com/usb/** .

All models also include:

- 10/100BASE-T Ethernet
- Four PCI slots, one containing ATI RAGE 128 card with 16MB of graphics memory
- Two FireWire ports
- Two USB ports
- Apple USB Keyboard and Mouse
- Macintosh-to-VGA monitor adapter
- Mac OS 8.6
- Microsoft Internet Explorer
- Netscape Navigator
- Complete setup, learning, and reference documentation
- Limited warranty

Preinstalled software contains electronic documentation. Backup software provided on CD-ROM.

Build-to-order (BTO) options

In addition to choosing from among Apple's prebuilt systems, you can order a custom-configured computer from your local reseller or the online Apple Store. This allows you to select from among the options listed below. For up-to-date information about options and availability, visit **http://www.apple.com/store**.

- Processor: PowerPC G3 running at 350, 400, or 450 MHz
- Memory: 64MB, 128MB, 256MB, 384MB, 512MB, 768MB, or 1GB
- Hard disk drive: 6GB or 12GB Ultra ATA; 9GB 7,200- rpm Ultra2 LVD SCSI with single- or dual-channel SCSI card; two 9GB 10,000-rpm Ultra2 LVD SCSI with single- or dual-channel SCSI card; or up to 36GB 7,200 rpm Ultra2 LVD SCSI with single- or dual-channel SCSI card
- Zip drive
- CD-ROM drive, or DVD-ROM drive with DVD-Video playback
- SCSI card with cable that supports standard SCSI, Fast Wide SCSI, and Ultra Wide SCSI (25- or 50-pin devices)
- 56K modem

For More Information

For more information about this product, or to find out where to buy Apple products, visit **http://www.apple.com** on the World Wide Web or call 1-800-538-9696. To purchase this product from the Apple Store, go to **http://www.apple.com/store**.

Apple stands behind its products with world-class service and support. Offering quality parts, extended hardware service options, phone support, and support via the Internet, we provide you with support choices that meet your needs. For more information, visit **http://www.apple.com/support**.

Power Macintosh G3 (Blue and White): Frequently Asked Questions

This article contains frequently asked questions (FAQ) regarding the Power Macintosh G3 (Blue and White), with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. What type of memory does the Power Macintosh G3 (Blue and White) use? Is the memory the same as in other Power Macintosh G3 systems?
2. What is the maximum amount of memory that can be installed in the Power Macintosh G3 (Blue and White)?
3. What is FireWire?
4. What is USB? Is it the same technology used in iMac?
5. What graphics accelerator does the Power Macintosh G3 (Blue and White) use? Can you tell me more about the 66-MHz PCI slot? Are the other three slots standard PCI slots?
6. Does the Power Macintosh G3 (Blue and White) have a floppy disk drive or serial port?
7. What kinds of hard disk drives does the Power Macintosh G3 (Blue and White) support? How many devices does it support? How do I connect my older I/O devices?
8. Does the Power Macintosh G3 (Blue and White) come with a modem?
9. What version of the Mac OS does the Power Macintosh G3 (Blue and White) include?
10. Is it possible to start up from a FireWire hard drive?

Question 1: What type of memory does the Power Macintosh G3 (Blue and White) use? Is the memory the same as in other Power Macintosh G3 systems?

Answer: The Power Macintosh G3 (Blue and White) requires PC100-compliant SDRAM. The memory must be 3.3-volt, unbuffered, 168-pin. If an SDRAM DIMM is sold or marketed as "PC100," this helps ensure that it functions correctly and optimally in your system. Please check with the manufacturer before purchasing. Memory from prior Power Macintosh (EDO or FPM RAM) computers cannot be used in this system.

Question 2: What is the maximum amount of memory that can be installed in the Power Macintosh G3 (Blue and White)?

Answer: The Power Macintosh G3 (Blue and White) has four DIMM slots that can accommodate up to 256MB DIMMs each, for a total of 1,024MB (1 gigabyte) of memory. When using 256MB DIMMs, use 128Mbit-device technology, not 64Mbit or 256Mbit. The 256MB DIMMs are available from the Apple Store.

Question 3: What is FireWire?

Answer: FireWire, also known as IEEE 1394, is an industry-standard, high-speed input/output (I/O) technology that can support multimedia and high-bandwidth devices like printers, digital cameras, and FireWire hard disk drives. Apple has even included 15 watts of bus power that will spawn a whole new class of easy-to-use self powered devices such as hard drives and cameras. FireWire is perfect for digital-video editing. The two FireWire ports on the Power Macintosh G3 (Blue and White) system support transfer speeds of up to 400 megabits-per-second (Mbps). FireWire lets you plug in and unplug devices without restarting the system. There are no device ID numbers to track, and the cables are long (14 feet) and easy to snap in. FireWire supports up to 63 devices. Information about FireWire technology can be found at:**http://www.apple.com/firewire**.

Question 4: What is USB? Is it the same technology used in iMac?

Answer: The USB (Universal Serial Bus) implementation in the Power Macintosh G3 (Blue and White) is the same as iMac. USB is a standard for attaching peripheral devices to a personal computer, delivering higher performance (up to 12 megabits-per-second) than previous serial port connection methods. USB is used to connect devices such as keyboards, mice, trackballs, modems, printers, scanners, and joysticks. You can plug in and unplug USB devices without restarting the system. Maximum cable length is 5 meters. Up to 127 USB devices can be attached to the computer simultaneously.The Power Macintosh G3 system ships with two USB ports. Apple also provides a USB keyboard and USB mouse with each system. The Apple USB Keyboard includes a built-in, bus-powered hub with two additional USB ports. The Power Macintosh G3 (Blue and White) also includes an Apple keyboard extender cable that increases the length of the Apple USB Keyboard cable and gives you the option to place the system either on the desktop or on the floor. Information about USB technology can be found at: **http://www.apple.com/usb**.

Question 5: What graphics accelerator does the Power Macintosh G3 (Blue and White) use? Can you tell me more about the 66-MHz PCI slot? Are the other three slots standard PCI slots?

Answer: All Power Macintosh systems come standard with the latest graphics accelerator chip from ATi, the RAGE 128. It includes 16MB of SDRAM graphics memory that provide extraordinary multitexturing valued by games developers. This speedy graphics card provides stellar 2D performance to support large displays and great 3D performance for professional 3D applications and games. The RAGE 128 card has an industry-standard VGA video connector. For customers who want to connect the Power Macintosh to older Macintosh-type (DB-15 pin) connectors, Apple supplies a VGA-to-Macintosh connector in the accessory kit. The three 33-MHz, 64-bit PCI slots are PCI 2.1-compliant slots and can also accommodate 33-MHz, 32-bit cards. You can add many different types of cards, including graphics, networking, or cards that support storage devices.

Question 6: Does the Power Macintosh G3 (Blue and White) have a floppy disk drive or serial port?

Answer: Like iMac, this system does not have a floppy disk drive. If you need to use a floppy disk drive, there are several third-party solutions available on the market. If you need to support serial devices, you can purchase third-party adapters or PCI cards. There is no serial port in the system. If you need to support SCSI devices, you can use third-party adapters or PCI cards. Apple is aggressively embracing I/O technologies such as FireWire and USB that allow you to attach devices directly to the system. There are several other options for getting information in or out of the system, including Internet access, optional internal Zip drives, LAN, and other mass-storage devices.

Question 7: What kinds of hard disk drives does the Power Macintosh G3 (Blue and White) support? How many devices does it support? How do I connect my older I/O devices?

Answer: The Power Macintosh G3 (Blue and White) system comes with an Ultra ATA hard disk drive or Ultra2 Low Voltage Differential (LVD) SCSI hard disk drive. Ultra2 SCSI is the next generation of SCSI. The Ultra2 LVD option includes a SCSI hard disk and a SCSI PCI card in one of the PCI slots. It doubles the data burst rate, up to 80 megabytes-per-second, providing greater system throughput. The maximum cable length is 12 meters, increasing flexibility in adding external storage devices. Ultra2 LVD SCSI supports up to 15 SCSI drive IDs. Customers who want to attach standard, Fast, or Fast Wide SCSI devices to the system along with Ultra2 LVD can add a PCI card offered by third-party vendors, but in that configuration the bus speed is slower.

Question 8: Does the Power Macintosh G3 (Blue and White) come with a modem?

Answer: The new Power Macintosh G3 comes standard with a built-in slot to accommodate a 56K modem that supports both the K56flex and V.90 standards. The modem is available as a build-to-order option through the Apple Store. Customers can also purchase external modems from third-party vendors.

Question 9: What version of the Mac OS does the Power Macintosh G3 (Blue and White) include?

Answer: The Power Macintosh G3 series ships with Mac OS 9.0. This version has lots of great new features and functionality. One of the highlights is Sherlock, your own private search detective. Sherlock is a powerful technology that lets you easily and quickly find information on local hard disk drives and the Internet.

Question 10: Is it possible to start up from a FireWire hard drive?

Answer: No, the Power Macintosh G3 (Blue and White) boot ROM cannot currently support starting up from FireWire-based storage devices.

iMac: Sharing Files Via IrDA

This article describes how to set up an infrared capable iMac to communicate via infrared to another Macintosh computer.
This article has been archived and is no longer updated by Apple.
First verify your computer supports IrDA by reviewing Article 20928: **"Macintosh Infrared: Is It IrDA Compatible?"**.

If your computer is equipped with infrared technology that uses the IrDA protocol, you can establish a wireless TCP/IP or AppleTalk connection to a network using an IrDA network access device, or exchange files with another IrDA equipped computer.

Depending on the type of network protocol that you are going to use, choose Infrared Port (IrDA) from the "Connect via" pop-up menu in either the AppleTalk control panel or TCP/IP control panel.

AppleTalk Setup

In the AppleTalk control panel, set the Connect via option to Infrared Port (IrDA) as shown in Figure 1. Close the window and save changes.

Figure 1 AppleTalk control panel

TCP/IP Setup

Open the TCP/IP control panel, shown in Figure 2.

Figure 2 TCP/IP control panel

Create an infrared configuration by selecting the Configurations option under the File menu, or press Command-K. Create a new set by selecting an existing set, duplicating it, and renaming it Infrared. Click Make Active. This step will make it easier to switch between IR, Ethernet, or other configurations later.

Select Connect via option "Infrared Port (IrDA)."

Enter an IP address and a default Subnet mask value as described in Article 30821: **"TCP/IP: Setting up a Private Network"**. If you are switching the connection from an existing Ethernet network you can use the previous network values.

Example:

Computer 1:

- IP addr10.0.0.1

- subnet mask 255.0.0.0

Computer 2:

- IP addr10.0.0.2

- subnet mask 255.0.0.0

Close the window and save changes.

Establishing an IrDA Connection

To establish an IrDA connection, position your computer within three feet of the other computer or infrared network access device. IrDA devices that are in range will appear in the Infrared control panel.

Verify File Sharing is turned on and the appropriate volume is being shared. Review the setup in the Mac OS Help under "Sharing files with others on the network." You may now open your Chooser, select AppleShare and select the file server you wish to connect to.

Troubleshooting

If you are unable to enable IrDA, verify the following extensions and control panels are active by viewing them in the Extensions Manager control panel. If they are inactive, make them active and restart your computer. If they are missing, you will need to reinstall those components from your original system software CD.

Extensions:

IrDALib Extension

InLanScanner/PPC Extension

Control panels:

Infrared Control Panel

If the Infrared Port (IrDA) choice is not available

For PowerBook computers, make sure that IrDA is selected in the Options section of the Infrared control panel, shown in Figure 3. The iMac will not have this choice, it will display Infrared built-in.

Figure 3 PowerBook Infrared control panel

Power Macintosh G3 (Blue and White): Use Keyboard That Came With Computer

I would like to use one of the new colorful iMac keyboards on my Power Macintosh G3 (Blue and White), is there any reason not to do this?
This article has been archived and is no longer updated by Apple.
Apple has made slight modifications to the Blueberry version specifically for the Power Macintosh G3 (Blue and White). As such, to avoid any possible issues with earlier keyboards, you should only use the Blueberry keyboard which shipped with your Power Macintosh G3.

Documented below are three revisions to the USB keyboard which Apple has shipped to date:

- The first keyboard was the original Bondi Blue keyboard which shipped with iMac. It should only be used on the original iMac.
- The second revision includes four of the five keyboards shipping with the new iMac 266; Strawberry, Tangerine, Lime, and Grape. These keyboards should be used only with iMac.
- The third revision is the Blueberry keyboard which ships with both the iMac 266, and the Power Macintosh G3 (Blue and White). It can be used on any iMac or Power Macintosh G3 (Blue and White).

Power Macintosh G3 (Blue and White): Error When Opening AOL Without Modem Installed

If the computer does not have a modem and you open the AOL (America Online) program, it is normal to receive error messages warning that AOL is running low on memory or is not installed correctly.

This article has been archived and is no longer updated by Apple.

These messages are generated because the AOL software does not detect a modem. No further troubleshooting is necessary; simply quit AOL.

Published Date: Feb 20, 2012

About Your Ultra SCSI PCI Card

This article describes and explains how to use the Apple Ultra SCSI PCI Card for Power Macintosh G3 (Blue and White) and Power Mac G4 computers. It is available as an option from The Apple Store at http://www.apple.com/ .

This article has been archived and is no longer updated by Apple.
The Apple Ultra SCSI PCI Card is a peripheral component interconnect (PCI) expansion card that allows you to connect devices through a Small Computer System Interface (SCSI, pronounced "skuh-zee"). SCSI is a standard method for connecting disk and cartridge drives, CD-ROM drives, scanners, and other devices. The SCSI port permits high-speed communication between the computer and SCSI devices.

Installing the Card

To install the card, you must open your computer, install the card, then close the computer. For detailed instructions on installing PCI expansion cards, please refer to the documentation that came with your computer.

About SCSI Devices

Once you have installed the card and closed your computer, you can connect and use up to seven external SCSI devices with your computer. You connect external SCSI devices in a chain to the SCSI port on the card. The first device in the chain plugs into the SCSI port; the second device plugs into the first device, and so on.

Figure 1, 50-pin Narrow Ultra SCSI connector

Before You Connect a SCSI Device

Before you connect a SCSI device to your computer, follow the instructions in this section.

IMPORTANT This section contains general instructions for attaching SCSI devices to your computer. Also, follow the specific instructions that came with your SCSI device that tell how to change a device's ID number and attach a SCSI cable or terminator to the device.

Make Sure Each Device Has a Unique ID Number

Each external SCSI device connected to your computer must have its own unique ID number from 0 to 6. The SCSI ID number helps the computer keep track of the devices when several devices in the SCSI chain are communicating with the computer simultaneously.

The SCSI devices can be in any physical order in the chain; it is not necessary to arrange them in numerical order. See the instructions that came with each SCSI device for information on checking and setting its SCSI ID number.

IMPORTANT If you use two or more devices attached to the SCSI interface with the same ID number, your computer will not start up properly, your equipment may malfunction, and you may lose data as a result.

Use the Right Type and Length of Cable

To attach a SCSI device to your computer or to another device in the chain, always use SCSI cables that are double-shielded, such as Apple SCSI cables. Never use printer-type RS-232 cables (commonly used with DOS and Windows computers). Poor-quality SCSI cables are often the cause of SCSI difficulties. Avoid mixing brands and types of SCSI cables.

If the device is the first or only one you're connecting, use a SCSI system cable to connect it to the computer's SCSI port. If the device is not the first one, use a SCSI peripheral interface cable to connect it to the last device in the chain.

Figure 2, SCSI system cable (left) SCSI peripheral Interface cable (right)

Keep the cables between SCSI devices as short as possible. Cables 18 to 24 inches long are best. PowerBooks and some SCSI devices (particularly scanners) may not be able to handle cables longer than 24 inches.

IMPORTANT The total length of the cables in a SCSI chain should not exceed 6 meters (about 20 feet). SCSI cables must have a 110-ohm impedance.

Terminate the SCSI Chain Properly

To ensure accurate transmission of information, a terminator must be present at each end of a SCSI chain. One terminator, at the beginning of the SCSI chain, is inside your computer. When you connect external SCSI devices, make sure that only the last external device in the chain has a

terminator.

IMPORTANT In almost all cases, only the first and last devices in the SCSI chain should be terminated, with one exception noted later in this section. Make sure that no external SCSI device but the last one has a terminator.

To terminate the last device in the chain, do one of the following:

- Use a device that has a built-in terminator as the last device in the chain. If you wish to attach two or more SCSI devices that have built-in terminators, an Apple-authorized service provider can remove the extra built-in terminators.
- If the device at the end of the SCSI chain does not have a built-in terminator, attach an external terminator. You can attach or remove external terminators yourself. (Do not use a black terminator; the black terminators are for Macintosh IIfx computers and certain LaserWriter printers only.) Terminators are available at authorized Apple dealers.

Figure 3, External SCSI terminator

IMPORTANT Do not attach a terminator to a device that already has a built-in terminator. If you do, your computer may not start up properly.

Exception to the "first and last" rule: If the total cable length in the chain is greater than 10 feet, the chain may need a third terminator at the 10-foot point. Do not add the third terminator unless you are experiencing a SCSI issue, and check all other possible causes of the situation before adding the third terminator.

Connecting a SCSI Device

After you read the earlier section, "Before You Connect a SCSI Device," follow the instructions below. Use these general instructions in conjunction with the more specific instructions that came with your SCSI device.

1. Shut down your computer and make sure the SCSI device is turned off.

2. Connect one end of a SCSI cable to the SCSI port on your SCSI device.

3. Connect the SCSI adapter that came with your computer, shown below, to the other end of the SCSI cable.

Figure 4, SCSI 50-pin to 25-pin adapter

4. Connect the SCSI cable with the adapter attached to the computer's SCSI port or to the last SCSI device already in the chain.
IMPORTANT Make sure the last device in the SCSI chain is terminated properly.

5. Turn on all devices in your SCSI chain. Then turn on your computer.
IMPORTANT Always turn on all external SCSI devices connected to your computer before turning on the computer itself. Otherwise, your computer won't recognize that the SCSI devices are connected to it and your computer may not be able to start up.

6. Install any necessary device drivers (software that makes a device work with your computer).

Drivers needed for a SCSI device usually come on a floppy disk with the device. Some older SCSI devices may require updated drivers to work with your computer. For more information about drivers, contact the manufacturer of your SCSI device.

Note: If you experience difficulties after connecting a SCSI device, see the troubleshooting documentation that came with your computer or Mac OS Help for solutions.

Keep in mind:

- If you use different types of SCSI devices (such as SCSI-2 and Ultra SCSI) in the same SCSI chain, all devices will perform at the level of the slowest connected SCSI device.

Technical Specifications

- Operating system: Mac OS 8.5 or later
- System requirements: Power Macintosh G3 (Blue and White), Power Mac G4, and Macintosh G3 servers
- Interface: One external, 50-pin Ultra Narrow SCSI connector
- Maximum data transfer rate: Up to 20 megabytes per second

- Supports up to 7 SCSI external devices of the following types: SCSI-1, SCSI-2, Fast SCSI, Ultra SCSI
- SCSI ID number: Card uses SCSI ID 7

Note: While the Apple Ultra SCSI PCI Card is functionally equivalent to the Adaptec 2930 card, Apple has only tested, and therefore only supports the card using the external connector.

Power Macintosh G3 (Blue and White): Certain Keyboards Disallow Open Firmware Startup

Some ADB AppleDesign keyboards cannot start up a Power Macintosh G3 (Blue and White) into Open Firmware.
This article has been archived and is no longer updated by Apple.

Symptom:

Some ADB AppleDesign keyboards do not properly signal the Power Macintosh G3 (Blue and White) to enter Open Firmware during startup.

Products affected:

AppleDesign keyboards identifiable by the ADB cable hardwired to the keyboard, have a stepped Caps Lock key, and say "AppleDesign" on the underside of the keyboard.

Solution:

Use the USB keyboard which came with your computer, or a different ADB keyboard.

Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White): Keyboard or Pointer Are Unresponsive

A limited number of USB Keyboard Extender Cables included in the accessory kit of Power Macintosh G3 (Blue and White) computers may not work correctly. This cable is used to extend the distance between the computer and keyboard.

This article has been archived and is no longer updated by Apple.

Symptom

The mouse pointer and keyboard may become unresponsive when used with the USB Keyboard Extender Cable. The computer operates normally without the extender cable.

Solution

Verify the symptom by removing the extender cable. If your computer operates normally with the extender cable removed, bring the cable to an Apple Authorized Service Provider to exchange it according to the terms of the Limited One-Year Hardware Warranty.

Removing the extender cable from the USB device returns the computer to normal operation if a replacement cable is not immediately available.

Power Macintosh G3 (Blue and White): Imation SuperDisk Driver Compatibility

After installing the Imation SuperDisk drivers that are pre-installed on the drive on a Power Macintosh G3 (Blue and White), the drive may still not respond.

This article has been archived and is no longer updated by Apple.
Version 1.10 or later of the Imation SuperDisk drivers are needed for use with the Power Macintosh G3 (Blue and White) computer. Make sure you are not using a previous version. The proper drivers are in the CD Extras folder on the CD that ships with your computer .
Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White): Cannot Boot from a RAID Striped Volume

My Power Macintosh G3 Blue & White computer has two 9 GB Ultra2 SCSI (LVD) hard drives. I'm using SoftRAID 2.1.5 to create one large striped (RAID 0) volume. After installing system software on this volume and restarting, I boot to a folder with a flashing question mark.

Why is this happening?
This article has been archived and is no longer updated by Apple.
This behavior is documented in the "About your Power Macintosh G3" Read Me preinstalled on the hard drive of the Power Macintosh G3 (Blue and White) computers. With the release of the iMac and later computers, Apple moved to a new Mac OS ROM architecture. This new architecture does not recognize multiple striped devices as a valid startup disk.

Workaround
Create 2 different volumes where one is either standard or mirrored (the startup volume) and the other is striped (the storage volume).

One would do this as follows:

- From within SoftRAID create a small Standard or Mirrored volume (big enough to store a System Folder as your startup volume).

Note: This volume CANNOT be a Striped volume. For example, create a mirrored 200 MB volume using both drives.

- Next, allocate the remainder of the space as a striped storage volume. Install the system software onto the smaller, non-striped volume and set the Startup Disk control panel to boot from this volume.
- After restarting, the computer should now boot from the smaller mirrored volume.

Power Macintosh G3 (Blue and White): Read Me

This article contains the Read Me document for the Power Macintosh G3 (Blue and White).
This article has been archived and is no longer updated by Apple.
Important Information About Your Power Macintosh G3

This document contains important late-breaking information about your Power Macintosh G3 computer, including:

Using Your Power Macintosh G3

- Starting up: the Mac OS ROM file
- Using the correct disk as a startup disk
- Restarting your computer
- Adjusting the volume for audio CDs and CDs with audio
- Using the Power Mac G3 modem
- Working with a RAM disk
- Connecting to a 10Base-T or 100Base-T network
- Performance problems using Ethernet
- Turning Virtual Memory off when installing third-party applications
- Allocating memory for third-party applications
- Customizing appearance and reinstalling system software
- Performing a clean installation of software
- About PlainTalk Speech Recognition 1.5.3

Third-party Software Issues

- Using up-to-date Internet browsers
- Reinstalling Internet Explorer and Netscape Navigator
- Installing third-party applications that install QuickTime
- Using FreePPP
- Using Norton Utilities
- Using two Ultra-SCSI disks striped with SoftRAID 2.1 or Remus 1.5
- Using a startup disk formatted with third-party formatting software
- Trouble with startup using a Zip cartridge formatted with Iomega driver version 6.0.1

Third-Party Hardware Issues

- Using Universal Serial Bus (USB) devices with your computer
- Using ADB dongles
- Connecting your computer directly to an Ethernet switch
- Using third-party PCI cards in your computer

For more information For additional information, see Mac OS Help and the online documentation that came with your computer. Apple provides substantial information online. If you have access to the World Wide Web (WWW), you can check the latest information about the Power Macintosh G3 in the support area at the following URL: **http://www.apple.com/support/**

Using Your Power Macintosh G3

Starting up: the Mac OS ROM file

The System Folder contains an important file-Mac OS ROM. This file is required for your computer to properly start up. If you delete this file or move it to another folder, your computer will not successfully start up.

Using the correct disk as the startup disk

If you selected a CD as the startup disk in the Startup Disk control panel, and you start up your computer without a CD or with a CD other than the software install or software restore CD that came with your computer, a single folder with a reappearing question mark appears on the screen. The computer will then search for any available System Folder and start up. If no System Folder is available, you must insert the software install or software restore CD that came with your computer and restart your computer. If you don't want to start up from a CD, make sure you select the hard disk as the startup disk in the Startup Disk control panel.

Restarting your computer

If you're having problems with your computer, you can often eliminate the problem by restarting your computer, which clears the computer's

memory. A restart allows you to save changes to any open documents and will close any open applications. To restart your computer, go to the Finder, open the Special menu and choose Restart, or press the Power button on your Apple USB keyboard. A dialog box appears. Click Restart.

If your computer freezes while you're working, try pressing the Power button on the front of the computer to shut down the computer. Then after the computer shuts down, press the Power button on the Apple USB keyboard or on the front of the computer to start up the computer. (The Control/Command/Power key combination used in earlier Macintosh computers is not available.) If that doesn't work, press the Reset button on the front of the computer. Your computer should restart. For more information, see the Troubleshooting Handbook that came with your computer.

Adjusting the volume for audio CDs and CDs with audio

If you can't hear an audio CD or audio portions of a CD, check the volume level in the AppleCD Audio Player and set it to a higher level, if necessary. If you started up your computer from a bootable CD, the volume for the AppleCD Audio Player may be set to zero.

Using the Power Mac G3 modem

Trouble connecting in V.90 mode

The modem used in the Power Macintosh G3 is a 56K modem based on the new V.90 specification. Any time a new modem standard is introduced there is a period of adjustment while various Internet Service Providers (ISPs) work to ensure that their POP (Point-of-Presence) servers are compatible with the new specification.

If you're having problems connecting in V.90 mode-if the modem won't connect at all, or the connection is dropped after a few minutes-it may be because the phone lines are too noisy or there's too much interference to sustain a connection of speeds above 33.6 kilobits/second (Kbps). Contact your ISP to ensure they are currently using V.90 compliant modems, or have plans to update to them in the near future. Use the PowerMac G3 Int 56K (V.34 Only) modem script, which forces the modem to connect at 33.6 Kbps or lower speeds. This type of connection is more reliable in situations where the phone line quality is questionable.

To use the Power Mac G3 Int 56K (V.34 Only) option, follow these steps:

1. Open the Modem control panel, in the Apple menu.
2. Make sure the "Connect via" pop-up menu is set to Internal Modem.
3. Open the Modem pop-up menu and choose PowerMac G3 Int 56K (V.34 Only).
4. If necessary, set the Sound and Dialing options.
5. Close the control panel. A message asks if you want to save the changes to the current configuration.
6. Click Save. Note: You do not have to restart your computer in order to use the new modem software.

Using FAXstf with your modem

To quick fax from a third-party application other than the Fax application, a printer must be designated using the Chooser (from the Apple menu, select Chooser). After selecting a printer, hold down the FAXstf "activation keys" to change the Print command to the Fax command.

Working with a RAM disk

The RAM disk cannot be used as a startup disk. If you create a RAM disk, its icon will not be displayed in the Startup Disk control panel.

The contents of a RAM disk are saved to the startup drive when you restart your computer. The contents are restored, once the computer restarts. Large RAM disks may add additional time to shutting down and restarting the computer.

WARNING The contents of the RAM disk can be lost if:

- the startup drive is read-only, such as a CD-ROM disc
- the startup drive does not have sufficient space to store the contents of the RAM disk
- the startup drive does not have a valid System Folder
- the computer loses power

IMPORTANT It is highly recommended that you periodically back up the data on your hard disk to an external storage device or network file server.

Connecting to a 10Base-T or 100Base-T network

When you connect your Power Macintosh G3 to an Ethernet network, the computer automatically senses whether it is connected to a 10Base-T

network or to a 100Base-T network. Some (possibly all) ports on some network hubs support both speeds. If you're using this type of hub, there may be a delay in establishing a network link. The delay may last for several seconds after you start or restart the Power Macintosh G3 and a message may appear saying the network is not available or that the network has only just become available. If you don't want a delay, connect your computer to an Ethernet network port that is not auto-sensing (10 or 100 megabits per second (Mbps) only). For more information, contact the manufacturer of the Ethernet hub or your network administrator.

Performance problems using Ethernet

If you experience performance problems on your Ethernet network, check with your network administrator. Your computer performs best when the Ethernet port is set to auto-negotiate.

IMPORTANT The duplex mode of an Ethernet link to a hub is not detected if the hub's port is not auto-negotiating. If the hub's port is not auto-negotiating, your computer will detect the appropriate speed but default to half duplex. If the hub's port at the other end of the link is configured for full duplex, a large number of late events can occur on the link. Set the hub's port to auto-negotiate where possible. If this isn't possible, then set the hub's port to half duplex. For more information, see the documentation that came with the Ethernet hub.

Turning Virtual Memory off when installing third-party applications

Some third-party applications may need virtual memory turned off in order to install the application properly. You can turn virtual memory back on after installation. For information on turning virtual memory off and on, see Mac OS Help.

Allocating memory for third-party applications

Some third-party applications may need to have more memory allocated to them in order for them to run or print properly. For information on increasing the amount of memory for an application, see Mac OS Help.

Customizing appearance and reinstalling system software

You can customize the appearance of certain things, such as the desktop pattern or font, using the Appearance control panel. The Power Macintosh G3 has its own default appearance, or theme. If you change this, or any other theme in the Appearance control panel (for example, to choose a different font) and save your settings as a custom theme, when you reinstall system software, the changes you made will remain and not be overwritten. However, if you make changes in a theme and do not save them as a custom theme, when you reinstall your system software, the settings return to the Power Macintosh G3 default theme.

Performing a clean installation of software

Before you do a clean install of your system software, turn File Sharing off in the File Sharing control panel.

About PlainTalk Speech Recognition 1.5.3

PlainTalk Speech Recognition 1.5.3 was originally engineered for 22.05 kilohertz (kHz) sound input. Your Power Macintosh G3 supports only a higher quality 44.1 kHz sound input. Because of this, the current version of speech recognition is not included on your software install CD. Apple is working on a new version of speech recognition software that will work with the Power Macintosh G3. If you have access to the World Wide Web, you can check the latest information at the following URL: **http://www.apple.com/speech**

Third-party Software Issues

Using up-to-date Internet browsers

Apple recommends that you use Netscape 4.0.5 or later, or Microsoft Internet Explorer 4.0.1 or later; both are included with your computer. If you use earlier versions, you may experience problems.

Reinstalling Internet Explorer and Netscape Navigator

If you inadvertently delete the Internet Explorer or Netscape Navigator applications, you can reinstall the applications using the software install CD that came with your Power Macintosh G3.

Note: Before you reinstall Internet Explorer or Netscape Navigator, you must move the file that contains your Internet sites list to a different location, such as the desktop. In Internet Explorer, this file is Favorites.html; in Netscape Navigator, the file is Bookmarks.html. If you reinstall Internet Explorer or Netscape Navigator, you will overwrite these files and any locations or bookmarks you have added or that were preinstalled will no longer be available. The Favorites.html file is located in the Explorer folder, within the Preferences folder, in the System Folder. The Bookmarks.html file is located in your profile folder, in the Netscape Users folder, in the Preferences folder, within the System Folder. (When you first opened Netscape Navigator, you were asked to enter a profile name. The Bookmarks.html file is in the folder with your specified profile name.)

To reinstall Internet Explorer or Netscape Navigator, you must do a custom installation of the Internet Access software component. To do this, follow these steps:

1. If necessary, move the Favorites.html or Bookmarks.html files to a different location. (See the Note above.)

2. In the pop-up menu next to the Internet Access software component, choose Customized Installation.

3. In the window that appears, choose the desired option: - To install Internet Explorer, click the arrow next to Microsoft, then click in the checkbox next to Internet Explorer. - To install Netscape Navigator, click in the checkbox next to Netscape Navigator.

4. Click OK, then click Start. The selected software is installed.

5. If necessary, move the Favorites.html file back into the Explorer folder, within the Preferences folder of the System Folder.

6. If necessary, move the Bookmarks.html file back into your Netscape Navigator profile folder.

For more information on reinstalling software, see the Troubleshooting Handbook that came with your Power Macintosh G3

Installing third-party applications that install QuickTime

QuickTime 3.0.2 is currently installed on your computer. Some third-party applications install QuickTime as part of their installation process. If an application installs a version of QuickTime earlier than QuickTime 3.0.2, make sure you do a custom install of the third-party application so you don't install an earlier version of QuickTime. If an earlier version of QuickTime is inadvertently installed on your computer, you can replace it by doing a custom installation of system software. See the Troubleshooting Handbook that came with your Power Macintosh G3 and follow the instructions on reinstalling system software. To reinstall QuickTime, you must do a custom installation of the Mac OS 8.5 software component. In the pop-up menu next to the Mac OS 8.5 software component, choose Customized Installation. Click the arrow next to Multimedia and in the list that appears, click in the checkbox next to QuickTime, then click OK. When you're ready to install the software, click Start.

Using FreePPP

If your Internet Service Provider (ISP) requires that TCP/IP be configured for FreePPP, FreePPP starts and tries to connect when attempting to access a server via the Chooser. If this happens, you need to reconfigure the TCP/IP control panel. In the "Connect via" pop-up menu, choose AppleTalk (MacIP) or Ethernet built-in.

Using Norton Utilities

Norton Utilities 3.5.3 or earlier is not compatible with the new Mac OS Extended format of hard drives, also known as HFS+. Apple recommends using Disk First Aid 8.2 or later if you need to test and repair your hard disk. For more information, see the Troubleshooting Handbook that came with your computer.

Using two Ultra-SCSI disks striped with SoftRAID 2.1 or Remus 1.5

You cannot start up your Power Macintosh G3 from a hard disk volume made by striping two Ultra-SCSI disks.

Using a startup disk formatted with third-party formatting software

You can use third party software such as Anubis or FWB to format and partition a hard disk in your Power Macintosh G3. However, if you install a system folder on one of these partitions and select it as your startup disk in the Startup Disk control panel, the computer will not use the Startup Disk volume selected.

Trouble with startup using a Zip cartridge formatted with Iomega driver version 6.0.1

You cannot start up your Power Macintosh G3 with a Zip cartridge that has been preformatted by Iomega with the driver version 6.0.1. To use the cartridge as a start up disk, you need to reinitialize it using the Erase Disk command under the Special menu in the Finder.

Third-Party Hardware Issues

Using Universal Serial Bus (USB) devices with your computer

About drivers for USB input devices

To run a USB device on a Mac OS-based computer, the device needs a software program called a "driver," available from the manufacturer of the device. Drivers appear as "extension" files that are stored in the Extensions folder within the System Folder. Apple already includes drivers in the Mac OS for USB mice, keyboards, hubs, and Imation's USB SuperDisk drive. Drivers for other devices, such as USB game devices, Epson and Hewlett-Packard printers, are included on the software install CD that came with your computer. These drivers can be found in the CD Extras folder, within the USB Device Drivers folder.

To install these drivers, double-click the appropriate folder to open it, then click the Installer icon and follow the onscreen directions. After you install the driver software, you should be able to use the device. If you have problems, please contact the manufacturer of the device. From time to time, new versions of USB drivers become available. For up-to-date information on driver software, contact the manufacturer of the device.

Some USB devices may not work with Mac OS until Mac OS drivers are made available. For information about the compatibility of a USB

device with Mac OS, contact the manufacturer of the device.

Some applications don't recognize USB devices if the devices are plugged in while the application is running. To use the USB device with that application, quit the application, make sure the device is properly plugged in, then start the application again.

Using ADB dongles

Some applications require the use of an ADB (Apple Desktop Bus) dongle for security purposes to prevent software piracy. The Power Macintosh G3 uses Universal Serial Bus (USB) technology. You may be able to use a USB dongle with these applications. For more information, contact the software manufacturer.

Connecting your computer directly to an Ethernet switch

If you connect your Power Macintosh G3 computer directly to an Ethernet switch, you will need to disable spanning tree on that port. If you do not disable spanning tree, your computer could duplicate the AppleTalk address of another computer on the same network which would result in both network connections becoming unreliable.

Using third-party PCI cards in your computer

Some third-party PCI cards will not work on your Power Macintosh G3, and may prevent the computer from starting up. Usually this can be fixed with a firmware upgrade for the PCI card. If you suspect you have a problem with a PCI card, shut down your computer, remove the card, and restart. Contact the card's manufacturer for a firmware upgrade.

Macintosh Server G3 Custom Mac OS Information

Your server comes with Mac OS 8.5.1, tuned for the Macintosh Server G3 with the addition of software extensions that enhance the performance of your server:

- Macintosh Server G3 Bundled Apple and Third-Party Software Information
- Mac OS 8.5.1 for the Macintosh Server G3
- AppleShare IP 6.1
- Network Assistant 3.5
- SoftRAID 2.1.5

AppleShare IP Web & File Update 1

AppleShare IP Web & File Update 1 is an extension that protects AppleShare IP Web & File servers (versions 6.0 and 6.1) from the denial-of-service attack known as Winnuke. This patch protects all services in the Web & File server. Such attacks are most common on Windows file sharing.

The likelihood of experiencing a Winnuke attack is small - it requires a deliberate malicious action, and the attacker has to have some knowledge of your system.

Background on the Winnuke Attack

A Winnuke attack is a malicious attempt to crash a server by sending it data that it cannot handle. Specifically, a high-priority message (also called an "out of band message") is sent over TCP/IP to the Windows file sharing port. Since priority messages are not a normal part of the Windows file sharing protocol (SMB), there is no established way to handle such messages, and the server considers this to be a fatal error.

This update instructs the server ignore all out of band messages. This does not affect the server's ordinary operation.

The AppleShare IP Web & File Update 1 Extension is installed in the System Folder of the Macintosh Server G3.

TA25835_Macintosh_Server_G_Blue_and_White_Read_Me.pdf

Software License Info

The version of AppleShare IP 6.1 included with your server has an unlimited user license. The AppleShare IP 6.1 license agreement allows you to install and use the server software (or the individual components thereof) on a single computer. This agreement allows you to install the individual server programs on different computers; it does not allow you to install the same server software on more than one computer at a time. To install the server software on more than one computer, you need to purchase additional copies of the software. For more information, see the license agreement that appears when you install the AppleShare IP 6.1 software.

Network Assistant 3.5 has a license for 10 computers, whether clients or servers.

The license for Mac OS 8.5 and SoftRAID is for one machine.

Late-Breaking Issues and Known Problems

Starting Up from SoftRAID Formatted Volumes

When you create HFS or mirrored volumes on your server using SoftRAID, only the first partition can be used as the startup volume. (You set the startup volume in the Startup Disk control panel.) You can determine the first partition using the SoftRAID application.

Using striped SCSI disks

You cannot start up your Power Macintosh G3 from a striped volume, only from HFS and mirrored volumes.

SoftRAID and Drive Setup

After installing SoftRAID drivers onto your disk drives and creating volumes, you should restart your computer to remove the Drive Setup drivers. Otherwise a situation could occur in which a volume seems to be mounted twice.

SoftRAID Striped Disks and Virtual Memory

The Macintosh Server G3 has a limit for the minimum stripe unit block size when Virtual Memory is enabled. This limit is 8 blocks. Setting the stripe unit block size below 8 blocks with Virtual Memory ON will cause the machine to freeze. If you need to run with a stripe unit size of less than 8 blocks, turn off Virtual Memory.

Disk Drives Compatible with SoftRAID

For information about disk drives that are compatible with SoftRAID, check the Apple Support web site: **http://www.apple.com/support** You can contact SoftRAID at: **http://www.softraid.com/**

Unavailable Ethernet Port

If AppleTalk is configured to use an Ethernet port that's no longer available (for example, if an extension needed by a PCI networking card is disabled), you will see a message that the system will use the built-in LocalTalk port. However, the Macintosh Server G3 does not have a LocalTalk port, so AppleTalk is turned off in this situation. If you open the AppleTalk control panel, this message appears: "Ethernet slot J9 is no longer available. Ethernet has been selected instead." You will then see another message asking whether to turn on AppleTalk.

Duplicate AppleShare IP Web and File Serial Number

It is not possible to use a single serial number to run AppleShare IP Web and File services on two servers. If this situation occurs, this message appears: "AppleShare Web & File server needs your attention. Please select it from the application menu." The number 3003 appears in the lower left corner. The server software may crash in this situation.

AppleShare IP 6.1 Installer Partition Size Limit

ASIP 6.1 Installer does not work with partitions of 21,504MB or larger.

Virtual Memory Limitations

Your Macintosh Server G3 ships with virtual memory turned off. You should make sure virtual memory is turned off when using RAID software, including SoftRAID. You can run AppleShare IP with a light to moderate load with virtual memory turned on, but for the best performance and stability, you should keep virtual memory turned off, especially when your server is handling a large number of connections. For increased stability in heavy load conditions, install additional memory.

Loss of Ethernet after Installing New Software

Some software installers may replace certain extensions, such as the "Ethernet (built-in)" extension, with older versions that are not compatible with the Macintosh Server G3. If Ethernet is unavailable after installing software, make sure that the "Ethernet (built-in)" extension is version 2.2 or later. If not, reinstall system software using the system software CD that came with your server.

Loss of Open Transport Networking after Installing New Software

TA25835_Macintosh_Server_G_Blue_and_White_Read_Me.pdf

The Macintosh Server G3 ships with Mac OS 8.5, which contains version 2.0.2 of Open Transport. Some network software installers may replace this version with an older version that is not compatible with the Macintosh Server G3. If networking is unavailable after installing software, make sure that Open Transport is version 2.0.2 or later. If not, reinstall system software using the system software CD that came with your server.

Headless Server Support

The Macintosh Server G3 can be configured to function without a monitor attached. The provided video adapter, part number 590-1120-A, must be installed.

Mac OS Extended Format

Macintosh Server G3 hard disk drives are set up with Mac OS Extended format (HFS+). Mac OS Extended format optimizes the storage capacity of large disk drives by reducing the minimum size of a single file. For more information, see the document About Mac OS Extended Format in the Mac OS Read Me Files folder.

Mac OS 8.5 also supports hard drives with Mac OS Standard format. To find out the format of a drive, select the drive and choose Get Info from the File menu.

Date and Time Handling in Mac OS Extended Format

When you change time zones in the Date & Time control Panel, the creation and modification times of files on a Mac OS Extended format volume change. If you change the time using the clock, the times do not change. Times on Mac OS Standard format volumes don't change.

Mac OS Extended format stores files' creation and modification times in Greenwich Mean Time (GMT) and stores the offset from GMT in Parameter RAM (PRAM). The system adds the offset to the GMT to determine a file's creation or modification time.

Aliases may not work properly when you change Daylight Saving Time or time zone. Incremental backups also may not work, since every file appears to have been modified.

Disk Recovery Utilities and Mac OS 8.5

Many older versions of disk recovery utilities are not compatible with Mac OS 8.5. Make sure you have recent versions of disk recovery utilities that are compatible with Mac OS 8.5 and Mac OS Extended format.

Installing Acrobat Reader Software from the System Software CD

To install Acrobat Reader software on your server, make sure that Server HD is selected as the startup disk. Then insert the Server System Software CD into your CD-ROM drive. Open the Adobe Software folder on the CD. Open the Acrobat Reader 3.0 folder on the CD and follow the installation instructions. See the onscreen help for instructions on how to change the startup disk.

Power Macintosh G3 (Blue and White): Graphics Accelerator Shows Red "X" on Startup

If the Extensions Manager is set to "Mac OS 8.5 All", or the set of extensions that loads at startup are otherwise customized, it is possible that an icon with a red "X" appears as the video driver extension(s) are loaded.
This article has been archived and is no longer updated by Apple.
If the necessary support files an extension needs to load have been disabled, a red X will appear over its icon during startup, indicating the extension did not load properly.

In Power Macintosh G3 (Blue and White) computers that ship with Mac OS 8.5.1, some of the ATI video driver extensions are part of the Mac OS 8.5 package, and some are part of the Power Macintosh G3 2.0 package. When selecting Mac OS 8.5 All, extensions that are not part of this set do not load, including the ATI Resource Manager extension. As a result, the ATI Graphics Accelerator do not load on the next restart and show an icon with the red X through it.

Before using the following workaround, create a duplicate Mac OS 8.5 set using the Duplicate button in the lower right corner of the window. This must be done because you cannot modify the default extension set. Name the set anything you like, then continue with the following steps.

1. In the Extensions Manager and choose View as Packages from the View menu.
2. Choose Mac OS 8.5 All from the Selected Set popup menu.
3. Check the checkbox next to the Power Macintosh G3 2.0 package to ensure all ATI extensions are enabled. (Make sure the checkbox has an "x" in it, not just a "-".)
4. Restart the computer.

Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White): Ghost Monitor When Using PCI Video Cards

A PCI video capture card that works with some PCI-based computers may not work with the Power Macintosh G3 (Blue and White) computer. In those cases, a blank desktop appears after the Power Macintosh G3 (Blue and White) starts up.
This article has been archived and is no longer updated by Apple.
The PCI and video architectures are such that the computer thinks a monitor is connected to any PCI card, except for the ATI RAGE 128 card in the 32 bit, 66 MHz PCI slot. This is normally not an issue since you would plan to use a video card you installed. However, some video capture cards also provide VRAM and a connector for external monitors. If you are using the card for capture but are not connecting a monitor to it, the computer still thinks that there is a monitor connected to that card.

The computer initially numbers the external monitors starting from the top-most PCI slot and ending with the 32-bit, 66-MHz PCI slot. Because of this, if you have a monitor connected to the ATI RAGE 128 card but not to the PCI video card, the computer starts up to a blank desktop. This is because the primary monitor with the menu bar is assumed to be connected to the PCI video card. To solve this issue, follow these steps:

1. Shut down the computer and connect the monitor to the PCI video card.
2. Connect the VGA adapter that comes with your computer to the ATI RAGE 128 card. This tricks the computer into thinking there is a monitor connected to the card.
3. Start up the computer. You should now see the menu bar and hard disk.
4. Open the Monitors & Sound control panel. Check the "Identify the startup screen" box. Drag the Happy Mac icon from the first monitor icon to the second. Then drag the menu bar from the first monitor icon to the second. At this point the menu bar moves to the invisible monitor.
5. Close the Monitors & Sound window.
6. Press the power button on the keyboard. The computer beeps and the shutdown/restart dialog appears, but you won't be able to see it because it's on the invisible monitor. Press the Return key and the computer shuts down.
7. Remove the VGA adapter and connect the monitor to the ATI RAGE 128 card.
8. Start up the computer.
9. Open the Monitors & Sound control panel and arrange the monitors so that only the corners are touching. This keeps you from accidentally moving on to the "ghost" monitor while working.

Since these settings are stored in both NVRAM and the Monitors & Sound preferences, you should not encounter this situation again.

Power Macintosh G3 (Blue and White): Connection Issues with FireWire DV Devices

This article discusses potential connection issue with some DV products when used with the FireWire DV implementation on the Power Macintosh G3 (Blue and White).
This article has been archived and is no longer updated by Apple.
The issue typically manifests itself when the FireWire application generates an error or simply doesn't see the device. If a DV device is transmitting DV (either in camera mode or playing back a tape) when it is plugged into the computer, the device may not be seen by the computer.

If this happens try powering the DV device off and back on. If the device still is not recognized, turn the device off, restart the Macintosh, then turn the device on.

If the camcorder or deck remains unrecognized by the Macintosh, ensure the device is powered off before connecting it to the computer.

Power Macintosh G3 (Blue and White): Switching Resolutions Yields Blank Gray Screen

If the Extensions Manager is set to "Mac OS 8.5 All", or the set of extensions that loads at startup are otherwise customized, it is possible that switching the monitor's resolution yields a blank gray screen and the mouse pointer seems to disappear.

This article has been archived and is no longer updated by Apple.
If the necessary support files an extension needs to load have been disabled, a red X will appear over its icon during startup, indicating the extension did not load properly.

In Power Macintosh G3 (Blue and White) computers that ship with Mac OS 8.5.1, some of the ATI video driver extensions are part of the Mac OS 8.5 package, and some are part of the Power Macintosh G3 2.0 package. When selecting Mac OS 8.5 All, extensions that are not part of this set do not load, including the ATI Resource Manager extension. As a result, the ATI software will not completely load, and you may see a blank gray screen after switching resolutions.

If this situation occurs, you may need to restart the computer using the reset button (with the triangle symbol) on the front of the computer. Video is restored after restart.

To resolve the situation, enable all of the ATI extensions using the following steps:

1. In the Extensions Manager and choose View as Packages from the View menu.
2. Choose Mac OS 8.5 All from the Selected Set popup menu.
3. Check the checkbox next to the Power Macintosh G3 2.0 package to ensure all ATI extensions are enabled. (Make sure the checkbox has an "x" in it, not just a "-".)
4. Restart the computer.

Removing Dust Accumulation From Inside the Computer

This article discusses dust accumulation within a computer and how to safely remove it.
This article has been archived and is no longer updated by Apple.
In general, dust accumulation is not harmful to the operation of the computer. An excessive accumulation can cause heat concerns since airflow over the various components is diminished.

The optimal method for removing excessive accumulations of dust is by vacuuming it up with a static protected vacuum designed for use with sensitive electronic components. An alternate method is compressed air such as that available in small aerosol cans at electronics retailers.

When using compressed air to remove dust, it is important to follow the instructions accompanying the product. Special care should be taken to always hold the can upright and not to shake the contents while spraying. Condensation and possible component damage may occur should these products be misused.

A gentle stream of air delivered in a series of short bursts should be all that is necessary to remove the majority of any accumulation, it is not necessary to remove all of the accumulation. Direct the stream of air away from mechanical components such as disk drives, power supplies, and expansion slots to prolong their life.

Apple Studio Display 17: How to Set up for Use With Earlier Power Macintosh Computers

This document describes how to set up your Apple Studio Display 17 display to make the maximum number of resolutions available for use with earlier Power Macintosh computers.
This article has been archived and is no longer updated by Apple.
If you are using any of the following computer models or graphics cards, you must turn off the DDC (Data Display Channel) control to make the maximum number of resolutions available:

- Power Macintosh 6100, 7100, and 8100 series
- PowerBook 1400 and 5300
- Power Macintosh 9500, 6200, 6300, and 6400 series
- some third-party video cards

For example, if you are using any of the above computer models, or a third-party video card, and you are able to access only the 640- by 480-pixel resolution setting, you must turn off the DDC control to access the rest of the resolution settings.

Turning off the DDC control

1. Press the OSD Enter button on the left of the monitor. The main menu of the on-screen display (OSD), the Basic Adjustments screen, appears. This menu contains the seven main control icons of the OSD: Basic Adjustments, Geometry, Image, Color, OSD Adjust, Language, and ETC. These icons represent controls that you use to adjust the picture and the on-screen display window.

Figure 1 On-screen display (OSD) menu

Figure 2 Basic adjustments screen

2. Use the left or right arrow buttons to highlight the ETC icon and press the Enter button. Select Off to disable DDC. More resolutions should now be available.

Figure 3 Image screen

3. Press the OSD Exit button to leave the OSD function.

Figure 4 ETC screen icons

Apple Studio Display 17: Removing Vertical Lines from Display

Upon setting up my Apple Studio Display 17, you may notice a number of thin vertical lines.

This article has been archived and is no longer updated by Apple.
The Diamondtron CRT used in the 17-inch Studio Display incorporates an aperture grid of very fine, vertical wires to enhance the sharpness of the image. Exposure to cold and or vibration can cause these fine wires to temporarily adhere to each other.

Note: Be careful not to confuse a vertical line with the horizontal stabilizing grid wires described in Article 11497 "**Apple Color Monitors: Cause of Thin Horizontal Line(s)**" . The horizontal wires are completely normal.

The vertical line anomaly is inherent to this type of display when exposed to lower temperatures and is not indicative of the need for a service call.

If your display is exhibiting visible thin vertical lines, you can most often break the adhesion between the grid wires by using the heel of your hand to moderately impact the side of your display under the Apple logo on the right, then left side. Using moderate force does not damage your display.

To avoid scratching or marring the external plastics, remove any jewelry or watches before you tap the display.

If the lines persist after a few attempts to break the adhesion of the wires, you should take the display to an Apple Authorized Service Provider for additional troubleshooting.

Power Macintosh G3 (Blue and White): Displaying DVD Video on Second Display

DVD movies are shown only if a display is connected to the factory-installed video card. If a second video card is installed in the computer, and a display is attached to that card, movies will not appear on that screen.

This article has been archived and is no longer updated by Apple.
With a display connected to a separate video card and none connected to the pre-installed ATI video card, the DVD video software opens and presents a video window. However, when a DVD disc is inserted, the window disappears. The application is still running but it is routing the video signal to the ATI card.

The only way to view a movie is to use the pre-installed ATI card. Because the DVD decoder is a daughter card attached directly to the ATI 128 Graphics accelerator card, it does not allow the video window to be moved to a second display or extended desktop.

This issue may also affect Power Macintosh G4 computers with additional video cards installed. The error message may indicate a software failure, but you should verify that the menu bar is on the built in factory card and that the video is being directed to that card instead of the additional video card.

Article 30887, "**Power Macintosh G3 (Blue and White): Apple DVD Player Cannot Open**" contains information on other DVD error messages.

About Your Dual Channel Ultra2 LVD SCSI Card

This article contains the information included with the Dual Channel Ultra2 LVD SCSI card available as a Build To Order option for the Power Macintosh G3 (Blue and White).

Note: A second Dual Channel card has been created for the Power Mac G4 (AGP Graphics). The card described in this article is equivalent to the Adaptec 3950U2B card and is not supported on the Power Mac G4.

This article has been archived and is no longer updated by Apple.

About Your Dual Channel Ultra2 LVD SCSI card

Your computer has a Dual Channel Ultra2 LVD SCSI card. This peripheral component interconnect (PCI) card allows you to connect devices that use the Small Computer System Interface (SCSI). SCSI is a standard method for connecting disk and cartridge drives, CD-ROM drives, scanners, and other devices. A SCSI port permits high-speed communication between the computer and the device.

You can connect internal and external SCSI devices to the card using SCSI cables. You can purchase SCSI cables from an Apple-authorized dealer or retailer.

Advantages of Your Dual Channel Ultra2 LVD SCSI card

Your Wide Ultra2 Dual Channel SCSI Card has two data channels and uses Low Voltage Differential (LVD) technology.

This technology provides the following benefits:

- High data transfer rates: Your card can transfer information over a single channel at up to 80 megabytes (MB) per second, twice as fast as Ultra SCSI devices. When the card's two channels are in use at once, the card can transfer information at up to 160 MB per second.
- Connect more devices: You can connect up to a total of 30 SCSI devices to the card (15 per channel) internally and externally (limited by the number of internal devices your computer is designed to hold).
- Use of longer cable lengths: The cables used to connect a chain of Ultra2 SCSI devices can be up to 12 meters (about 39 feet) long facilitating easy positioning of external devices.
- Compatible with older SCSI devices: You can connect other SCSI devices that are not as fast as the Ultra2 SCSI, such as Ultra Wide, Ultra Narrow, Fast, and Standard SCSI devices.

Note: Older SCSI devices must use SCSI Manager 4.3 compliant drivers. To determine if your device works with SCSI Manager 4.3, see your SCSI device documentation.

You can connect two chains of SCSI devices to your card, one chain to each channel. You can arrange devices so that Ultra2 SCSI devices can perform at their optimum transfer rate on one channel, while older devices that perform at slower rates can be assigned to a second channel.

Important: If you mix different kinds of SCSI devices that run at different speeds on one channel (internal or external), the channel will operate in single-ended mode for older SCSI devices with a top transfer rate of 40 MB per second.

Note: Make sure you use a SCSI cable compatible for use with Ultra2 devices that have Low Voltage Differential (LVD) technology.

About Connecting SCSI Storage Devices

You can connect SCSI devices in a chain. The first device connects to one of the SCSI card's connectors, the next device connects via a cable to the first SCSI device, and so on. The card has an external cable connector for external SCSI devices and three internal connectors for internal devices.

Channel A serves the external cable connector and one 68-pin internal connector. Channel B serves the other 68-pin internal connector and a 50-pin connector for connecting older internal SCSI devices (although it is not recommended that you install older narrow SCSI devices internally).

All devices connected to channel A connectors are part of a single SCSI chain. Likewise, all devices connected to channel B connectors are part of another SCSI chain. You can connect up to 15 total devices to each channel for a total of 30 devices (although your computer may not be able to house this many devices internally.) The Apple Power Macintosh G3 (Blue and White) is designed to house three internal SCSI devices.

About Channel Data Transfer Rates

The SCSI transfers information in one of two modes: Ultra2-LVD mode or single-ended mode.

In Ultra2-LVD mode, a chain of Ultra2 SCSI devices can transfer data at their fastest speed, 80 MB per second. However, if you connect a slower SCSI device to the chain, the channel defaults to a slower single-ended data transfer mode.

In single-ended mode, a channel can support different data transfer rates from each device up to a top rate of 40MB per second. For example, if you connect mixed SCSI devices that have different transfer rates, each device transfers data at its own speed without affecting the transfer rate of other devices on the channel. An Ultra SCSI device can transfer data at 40MB per second, the top speed for the channel, and another slower device transfer data at a slower rate. In single-ended mode, however, Ultra2 SCSI devices can only transfer data at 40 MB per second, half their potential rate.

When you plan your chain of SCSI devices, take into account whether you want the chain to operate in Ultra2-LVD mode or single-ended mode.

Make Sure Each Device In a Chain Has a Unique ID Number

Each SCSI device in a chain connected to your card must have its own unique ID number from 0 to 15 per channel. (The number 7 is assigned to the card.) You can assign ID's from 0-6 and 8-15. The SCSI ID number helps the computer keep track of the devices when several devices in the SCSI chain are communicating with the computer simultaneously.

The SCSI devices can be in any physical order in the chain; it is not necessary to arrange them in numerical order. See the instructions that came with each SCSI device for information on checking and setting its SCSI ID number.

Important: If two or more devices in a chain have the same ID number, your computer may not start up properly, your equipment may malfunction, and you may lose data as a result.

Use the Right Type and Length of Cable

Your computer includes a cable for connecting up to three internal SCSI devices.

To attach an external SCSI device to your computer or to another external device, always use SCSI cables that are double-shielded, such as Apple SCSI cables. Never use printer-type RS-232 cables. Poor-quality SCSI cables are often the cause of SCSI problems. Avoid mixing brands and types of SCSI cables.

Keep the cables between SCSI devices as short as possible.

Important: The maximum cable length that you can use depends on the types of devices in the chain. See the information below about maximum cable lengths:

SCSI device	Maximum cable length
Wide Ultra2	12 meters (about 39 feet)
Ultra	1.5 meters (about 5 feet)
SCSI-1, SCSI-2	3 meters (about 10 feet)

Note: The internal cable connected to the card represents one meter of cable length. For example, when you connect Ultra external devices, the internal cable takes up one meter of the 1.5 meter maximum length, leaving .5 meters of cable length for connecting devices.

Terminate the SCSI Chain Properly

To ensure accurate transmission of information, a terminator must be present at each end of a SCSI chain. When you connect SCSI devices, make sure that only the last external device in the chain has a terminator. (The second terminator at the beginning of the SCSI chain is inside your computer.)

The cable supplied for internal SCSI devices within your computer is already correctly terminated.

To terminate the last device in an external chain, do one of the following:

- Use a device that has a built-in terminator as the last device in the chain.

  If you wish to attach two or more SCSI devices that have built-in terminators, an Apple-authorized service provider can remove the extra built-in terminators.

- If the device at the end of the SCSI chain does not have a built-in terminator, attach an external terminator. You can attach or remove external terminators yourself. Terminators are available at authorized Apple dealers.

Important: Do not attach a terminator to a device that already has a built-in terminator. If you do, your computer may not start up properly.

Connecting an Internal SCSI Storage Device

To install an internal SCSI device, see the setup manual that came with your computer. It's recommended that you connect internal SCSI devices to channel B.

Connecting an External SCSI Device

TA25845_About_Your_Dual_Channel_Ultra_LVD_SCSI_Card.pdf

To connect an external SCSI device to your card, follow the instructions below. Use these general instructions in conjunction with the more specific instructions that came with your external SCSI device.

1. Shut down your computer and make sure the SCSI device is switched off.

2. Use a SCSI cable to connect the device either to the card's external SCSI connector or to the last SCSI device already in the chain.

Use a SCSI cable that is compatible with the SCSI device. For more information, see the documentation that came with the SCSI device.

Use the thumbscrews on the connectors to make a tight, reliable connection. Do not overtighten the thumbscrews.

3. Turn on all devices in your SCSI chain.

Important: Always turn on all external SCSI devices connected to your computer before turning on the computer itself. Otherwise, your computer won't recognize that the SCSI devices are connected to it and your computer may not be able to start up.

4. Turn on your computer.

Icons appear for all SCSI devices connected.

Note: If you do not see an icon for a device, you may need to use drive formatting software, such as Drive Setup, to mount the device and make it available for use.

5. Install any necessary device drivers (software that makes a device work with your computer).

Drivers needed for a SCSI device usually come on a disk or CD with the device. (If no drivers come with the device, contact the deviceís manufacturer.) Some older SCSI devices may require updated drivers to work with your computer.

Note: If you experience problems after connecting a SCSI device, see the troubleshooting documentation that came with your computer for possible solutions.

Technical Specifications

- Supports 8-bit and 16-bit Ultra2, Ultra Wide, Ultra Narrow, Fast, and Standard SCSI devices
- Supports up to a total of 30 SCSI devices internally and externally (15 per channel, limited by the number of internal devices your computer is designed to house)
- Transfers data at up to 80 Megabytes per second (MB/sec) on each channel
- Supports SCSI Manager 4.3 compliant drivers only

Power Macintosh G3 (Blue and White): Error When Installing Imation Superdisk 1.2 Driver

The install CD included with the Imation Superdrives will not install on a Power Macintosh G3 (Blue and White).
This article has been archived and is no longer updated by Apple.
Attempting to install the Imation Superdisk drivers from the included CD will generate a dialog box stating "This program cannot run on your computer. See the documentation for more details."

The version of the driver on the CD works fine on the iMac but will not install on the Power Macintosh G3 (Blue and White). Imation has posted an updated driver which can be downloaded from their web site at **http://imation.com/support/products/superdisk_drivers.html**

Note: The Power Macintosh G3 (Blue and White) is shipped with the Imation drivers pre-installed so there is no need to run the install program prior to use. If you need to reinstall the drivers, download the latest version from Imation.
Published Date: Feb 20, 2012

Apple Displays: DPMS Mode Support

This article details the Display Power Management Signaling (DPMS) standard and how it is implemented with Apple displays.
This article has been archived and is no longer updated by Apple.
DPMS (Display Power Management Signaling) is a standard developed to save energy and maximize the useful life of computer displays. By switching the horizontal and vertical sync lines on or off, a DPMS compliant video card provides the capability to place the monitor into one of four modes (Normal, Standby, Suspend, Off).

Each mode puts the display into a different powered state from fully powered up, to the Off mode. In the Off mode, only a small auxilliary circuit is running which monitors the horizontal and vertical signals to wake up the monitor.

Mode	H/V Sync	Power Consumption*	LED	Notes
Normal (On)	On/On	Less than 150 watts	Green	Display operating
Standby	Off/On	Less than 15 watts	Amber	Guns off, power supply on
Suspend	On/Off	Less than 15 watts	Amber	Guns off, power supply off
Off	Off/Off	Less than 5 watts	Amber	All off except aux circuit

Standby is the mode typically set by screen savers when they blank the screen rather than displaying a pattern. The tube filaments are left on to allow a faster recovery when the display is needed again. The Off mode (Energy saver mode) is set when the Macintosh is put in the sleep mode or by using the Energy Saver control panel to put the display to sleep. In this mode the horizontal and vertical sync signals from the Macintosh video output are turned off as well as the tube filaments in the CRT. Waking up from this mode takes a few seconds longer because the tube filaments must warm up.

Note: The power consumption values provided above are valid only for the Apple Studio Display 17. The actual values may vary depending on which display is being used, and whether DPMS support is enabled.

Published Date: Feb 20, 2012

About Your Apple Gigabit Ethernet PCI Card

This article comprises the About document for the fiber optic Gigabit Ethernet PCI card originally made available for the Power Macintosh G3. This article has been archived and is no longer updated by Apple.

About Your Apple Gigabit Ethernet PCI Card

Your computer has a Gigabit Ethernet PCI Card installed. With this peripheral component interconnect (PCI) card, you can connect your computer to a 1000Base-SX Ethernet fiber optic network and transfer information at up to one gigabit per second, ten times faster than data transfer rates for 100Base-TX networks.

Your card works with Ethernet equipment that supports standard Ethernet maximum and minimum frame size, frame format, and protocols. For a list of the supported standards and protocols, see *Standards and Protocols Supported* at the end of this document.

Connecting to Your Ethernet Network

Use a 62.5 micron Multi-Mode fiber (MMF) or 50 micron MMF fiber optic cable with 850 nanometer (nm) SC connectors to connect your card to a fiber optic network.

Note: The cable length from your Ethernet port to a network hub should not exceed 260 meters for 62.5 Micron Multi-Mode fiber (MMF), or 550 meters for 50 Micron MMF fiber. Check with your network administrator if you have a questions about the cable length.

To connect your Gigabit Ethernet PCI Card to your network, follow these steps:

1. Turn your computer off.

2. Insert the SC connector from your cable into your card's SC connector ports.

3. Insert the other end of your cable into a connector or hub connected to your network.

Installing the Gigabit Ethernet PCI Card Software

If your computer uses Mac OS X Server, the required Ethernet software is already installed on your computer. No further installation is necessary.

If your computer uses Mac OS, you must install two system extensions in your System Extensions folder. These extensions are on the Gigabit Ethernet CD.

To install the Gigabit Ethernet PCI Card software:

1. Turn on your computer.

2. Insert the Gigabit Ethernet CD in your CD ROM drive.

3. Double-click the CD icon to open it.

4. Locate the extensions, Apple Gigabit Enet I and Apple Gigabit Enet II, and drag them onto your closed System Folder.

A message asks if you want to install these files into the Extensions folder.

5. Click OK.

6. After installing the software, restart your computer.

Configuring Your Computer

After you start up the computer, you may need to further configure your computer for a network connection. Your network administrator can provide the necessary information. You can also find help for configuring your network software in the manual and onscreen help that came with your computer.

Technical Specifications

Features

- 1000Base-SX card compliant with IEEE 802.3z
- One gigabit per second data transfer rate, 850 nm (full duplex)
- Single 1000Base-SX (GBE) port
- Full-duplex gigabit Ethernet interface

- Dual DMA channels
- Supports full flow control
- 33/66 MHz, 32 or 64-bit bus master
- PCI local bus rev. 2.1 compliant
- Duplex SC fiber connector
- SC connector characteristics: operating range at 62.5 micron MMF up to 260 meters, at 50 Micron MMF up to 550 meters
- 10 watts maximum power consumption
- 3.5 V and 5 V voltage

Standards and Protocols Supported

- Logical Link Control (IEEE 802.2)
- SNMP (limited MIB)
- Ethernet (IEEE 802.3z)
- Media Access Control (IEEE 802.3u)
- Flow Control (IEEE 802.3x)

AppleWorks: Justified Text Prints Beyond Margin

Text may print beyond a document's margins, especially if it is fully justified.

This article has been archived and is no longer updated by Apple.

Symptom

Text prints beyond a document's margins, especially if it is fully justified, but also if it is right aligned, or center aligned. Text that is left aligned prints correctly.

Solution

- Print to a different printer.
- Create a PDF version of the document and print the PDF version.

Creating and Printing PDF Documents

You can use PrintToPDF or Adobe's PDFWriter-among other software-to create a PDF document. You can use Adobe Acrobat Reader to open and print the PDF file you create.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

Dutch iMac Restore CD: Error When Trying to Restore

When using the Dutch iMac Rev. B restore CD (N691-2090) on a Rev. B iMac (M6709N/B), the erase process does NOT function correctly if the Erase Before Restore check box is selected.

Note: This does not affect any iMac other than those which use the Dutch restore CD noted above.
This article has been archived and is no longer updated by Apple.
Attempting to do so will result in the Apple Software Restore application returning the dialog "De volume informatie kon niet worden gekopieerd. -46". After you press OK you then get the following message "Het terugzetten van bestanden is mislukt. Het volume Macintosh HD is wellicht onbruikbaar."

Disk First Aid will also report problems with the hard disk that it cannot repair.

Recommendations:

The work-around is to use Drive Setup to initialize the Hard Drive prior to installing or restoring without the erase before restore option selected.

Published Date: Feb 20, 2012

ColorSync 2.6: Issue with ICC Profiles

This article describes an issue with some ColorSync profiles which may not appear in the ColorSync Control Panel. This error can occur even if the profile is properly installed. The solution is to use the ColorSync Profile First Aid 2.6 utility posted to Apple Software Updates.
This article has been archived and is no longer updated by Apple.

Overview

ColorSync 2.6 is the first release of the software which implements full support for Unicode information which is stored in the desc tag of the Profile. Supporting this allows it to work with Unicode based Operating Systems.

If a profile is no longer showing up in the Control Panel after installing ColorSync 2.6, you should contact the developer who created the Profile or download the Profile First Aid utility from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Details

The desc tag of a profile, as defined by the ICC (International Color Consortium, http://www.color.org), contains up to three strings. The first is a required 7-bit roman ASCII string. The second is an optional localized Unicode string. The third, also optional, is a localized string in Mac script-code format. Applications typically use one of the available strings to show the name of profiles in a list or pop-up menu. The ICC definition of the 'desc' tag requires that all three strings must be null terminated and that all three strings are preceded by a character count that includes the null terminator. It also worth noting that for the Unicode string, the character count must not be confused with a byte count because each Unicode character requires two bytes.

Previous releases of ColorSync only made partial use of this tag. ColorSync 2.6 is the first release of the technology that was designed to run both on Mac OS and Windows. Since Mac script-code format strings are not usable on Windows, ColorSync clients need to have access to the localized Unicode string.

The remedy for Profiles created without a Unicode tag is to repair the affected profiles.

Apple Modem Updater 1.3.5: Read Me

This article comprises the Read Me for the Apple Modem Updater version 1.3.5. This software was released by Apple on March 29, 1999 and is available for downloading from the Apple Software Updates Web site at http://www.apple.com/swupdates.

If you have questions as to when to install available updaters, refer to Knowledge Base article 58174: "**iMac: When to Install Available Updaters**".

To search for other software updates specifically related to the iMac please refer to the **Apple Downloads** page.

Description:
The Apple Modem Updater will update all modems in the iMac and the PowerBook G3 Series computers (both the K56flex only modem shipping in earlier PowerBook G3 Series and the V.90 compliant modem currently shipping in the PowerBook G3 Series).

Note: The PowerBook G3 Series (Bronze keyboard) does not need this update because it is already installed in these computers from the factory.
This article has been archived and is no longer updated by Apple.
The updater installs version 2.2 of the Rockwell firmware which contains the most recent versions of both the V.90 and the K56flex protocols. The modems can use either the K56flex or V.90 protocols and will automatically negotiate with the service provider to use the appropriate one. The modem scripts have been revised to properly reflect the new V.90 connection speeds, and to resolve a European blind dialing issue.

This software bundle contains:

- New modem firmware for the internal 56K modem
- New modem scripts (CCL's)
- New PowerBook G3 Series Modem extension.

The new PowerBook G3 Series Modem extension resolves several known issues. These include:

- Modem power-off issue: Resolves a modem power down issue (resulting in battery drain during PowerBook G3 sleep), if the PowerBook G3 Series computer is manually put to sleep before the modem has been shut down for 30 seconds.
- Modem popping sound: Resolves an audible pop when the modem is being powered on or off.

Important Information About the Apple Modem Updater and New Modem Software

This updater supports the internal modem which came with your PowerBook G3 Series or iMac computer.

This software bundle contains:

- new modem firmware for the internal 56K modem
- new modem scripts (CCL's)
- new PowerBook G3 Series Modem extension

Your existing modem was originally shipped with the latest firmware available, however, 56K modems are still in their infancy and will be undergoing changes over the next several months. The Apple Modem Updater installs the most recent Rockwell firmware, based on version 2.2.

The modem scripts have been revised to properly reflect the new V.90 connection speeds, and to resolve a European blind dialing issue.

The new PowerBook G3 Series Modem extension resolves several known issues. These include:

Modem power-off issue: Resolves a modem power down issue (resulting in battery drain during PowerBook G3 sleep), if the PowerBook G3 Series computer is manually put to sleep before the modem has been shut down for 30 seconds.

Modem 'popping' sound: Resolves an audible pop when the modem is being powered on or off.

This document also contains several references to articles in the Knowledge Base that discuss modem connectivity issues. These articles are recommended reading for better a understanding of 56K modem technology.

What The Apple Modem Updater Does

The Apple Modem Updater will update all modems in the iMac and the PowerBook G3 Series computers (both the K56flex only modem shipping in earlier PowerBook G3 Series and the V.90 compliant modem currently shipping in the PowerBook G3 Series). The updater installs version 2.2 of the Rockwell firmware which contains the most recent versions of both the V.90 and the K56flex protocols. The modems can use either the K56flex or V.90 protocols and will automatically negotiate with the service provider to use the appropriate one.

After you have updated the modem you may notice that the connection speed that is reported when you first establish a connection may be lower than it was prior to the upgrade, however the modem throughput will be at least as good and often better than before the upgrade. Throughput is the measure of how quickly a certain amount of data is transferred from one modem to another. It is important to remember that the connection speed that is reported is only the initial connection speed. The modems will adjust their communications speed as line conditions require. A faster connection speed does not necessarily indicate a higher throughput, factors like resending data due to noise on the phone lines will lower overall throughput.

This is discussed in more detail in:

- article 30734, "**V.90 Protocol: Connectivity Discussion**"
- article 24482, "**56Kbps Modems: Getting The Fastest Connection**"

Updating The Modem

Before updating your modem, make sure the modem and modem port are not in use. Turn answering off in fax or other communications programs. Log off any open Internet/modem connections. (Disconnecting the phone line will force any active modem connections to be closed.)

Important: If you are updating a modem in a PowerBook, connect the PowerBook to the AC adapter to guarantee an uninterrupted supply of power to the computer.

Important: Do not cancel the installation process once you start updating; canceling the upgrade process will damage the modem. This modem updater may take up to five minutes to complete.

To update your modem:

1. Double click on the Apple Modem Updater icon.

2. Click Start.

Status messages appear as the updater locates the modem and checks for the current firmware version and type of modem.

3. Click Done when the update is complete.

4. For PowerBook G3 Series users:

- Open the folder For PowerBook G3 Users
- Drag copy the files PowerBook G3 Internal 56K and PowerBook G3 Int56K (v.34 Only) into the Modem Scripts folder, located in the Extensions folder within the System Folder.
- Click OK to replace any existing files.
- Open the Modem control panel and select: PowerBook G3 Internal 56K
- Drag copy the file PowerBook G3 Series Modem into the Extensions folder within the System Folder.
- Click OK to replace any existing file.

For iMac users:

- Open the folder For iMac Users
- Drag copy the files iMac Internal 56K and iMac Internal 56K (V.34 Only) into the Modem Scripts folder, located in the Extensions folder within the System Folder.
- Click OK to replace any existing files.
- Open the Modem control panel and select: iMac Internal 56K

PowerBook G3 Series users will need to restart their system after installing the PowerBook G3 Series Modem extension. It is not necessary for iMac users to restart their system.

5. If you have previously installed a V.34 modem script, open the Modem control panel and select:

PowerBook G3 Internal 56K (for PowerBook G3 Series users)

iMac Internal 56K (for iMac users)

Note: The V.34 script forces the V.90 modem to connect at V.34 speeds and was recommended if you had problems connecting in V.90 modem. If V.90 connection reliability issues still exist after updating the modem, reselect the V.34 modem script. Refer to article 22234, "**iMac: V.34 Modem Script**" for complete details.

If you experience a problem with the Apple Modem Updater, shut down your computer for 40 seconds to reset the modem. Restarting the computer will not reset the modem. Then begin the modem firmware upgrade process again.

TA25853_Apple_Modem_Updater_Read_Me.pdf

Future Modem Software

New firmware updates, modem scripts, and modem drivers may be released for 56K modems until the technology stabilizes. For more information on V.90 modem upgrade information, see Apple's support web site: **http://www.apple.com/support**.

Power Macintosh G3 (Blue and White) AV Bundle: Read Me

This article comprises the Read Me for the Power Macintosh G3 (Blue and White) AV Bundle.
This article has been archived and is no longer updated by Apple.

Read This First

Getting Started With Your Power Macintosh G3

Your Power Macintosh G3 has an ATI Xclaim VR graphics card you can use to create and edit video movies, put on presentations, and display graphics on your computer display or other large-screen monitor or TV.

Included are:

- a Power Macintosh G3 computer and accessory kit
- an Apple Studio Display 17 and display software
- an ATI Xclaim VR graphics card (installed in your computer) and adapter cable
- an Avid Cinema CD for installing the Avid Cinema video editing software and ATI Xclaim VR graphics card software

Setting Up Your Power Macintosh G3

Set up your computer in the following order:

1. Set up your Power Macintosh G3, following the instructions in the Setting Up Your Power Macintosh G3 manual.

Note: The ATI Xclaim VR graphics card installed in your computer replaces the standard graphics card installed in a Power Macintosh G3. The connectors on your graphics card look different from illustrations shown in the Setting Up Your Power Macintosh G3 manual. See this booklet for information about connecting cables to your graphics card.

2. Set up your Apple Studio Display 17, following the instructions in Setting Up Your Apple Studio Display. The ATI Xclaim VR graphics card is already installed in your computer. Connect the display cable to it.

Note: When connecting your display to the graphics card, be sure to use the VGA-to-Macintosh adapter included with the display. Instructions for connecting the adapter are in the display box.

3. Install the graphics card software and video editing software located on the Avid Cinema CD. To install your software, follow the instructions provided in this booklet.

About Your Avid Cinema and Graphics Card Software

When you install your Avid Cinema video editing software, the documentation for the software is installed on your hard disk as an Adobe Acrobat file. The installation also installs the software required to use the ATI Xclaim VR graphics card. For information about using your video editing software, see the file Making Movies.pdf, located in the Avid Cinema folder on your hard disk. For instructions about setting up your ATI Xclaim VR graphics card, see the Read Me file in the Avid Cinema folder.

Installing the Software

After you have set up your Power Macintosh G3 and Apple Studio Display 17, install the video editing and graphics card software.

1. Place the Avid Cinema CD in your CD drive.

2. Open the disk icon, if necessary. Three folders appear that identify three steps for installation.

3. Open the folder Step 1 Install ATI Xclaim, and double-click the Installer icon to begin installation.

4. Follow the directions on the screen. After installing the ATI Xclaim VR software, restart your computer.

5. Open the folder Step 2 Install Avid Cinema, and double-click the Installer icon to begin installation.

6. Follow the directions on the screen.

7. Open the folder Step 3 Copy Example Media, and copy the files you want to your hard disk.

8. After the software is installed, open the Read Me file located in the Avid Cinema folder on your hard disk and follow the directions for setting up your ATI Xclaim VR card.

Note: During installation, a copy of the ATI Xclaim VR graphics card documentation is placed on your hard disk as an Acrobat Reader file. The manual is called Xclaim VR Manual.pdf. You can refer to this manual for general information about your graphics card. Disregard the hardware and software installation instructions in chapters 2 and 3, as well as information about the Control Strip on page 39 that mentions features not

supported by your software.

Connecting Cables to Your Graphics Card

Most VCRs, camcorders, and other video devices use two types of cable connectors: S-video and Composite style (also known as RCA style) cables. See your video device documentation to determine the type of cable to use. Most video devices come equipped with these cables. For more general information about video cables and connecting a device to your computer, also see the Making Movies.pdf file on your hard disk.

Figure 1, S-video and RCA-style connectors

You can connect your graphics card to a VCR, camcorder, or other device, such as a laserdisc player, to capture video for editing. You can also connect your graphic card to another video device, such as a VCR, to record edited video on tape or display it on another monitor or TV. You must connect your computer's sound input and output ports to your video device if you want to transfer or work with sound.

Note: Although your computer has a FireWire port for transferring digital video, the Avid Cinema software does not support this video format and you cannot use this port.

Capturing Video from Your VCR, Camcorder, or Other Device

Your card has four connectors: a monitor port, a TV Out port, an S-video in port (S VID IN), and a Composite video in port (VID IN).

Figure 2, Locations of ports on the ATI Xclaim VR graphics card

Transferring Video to Your VCR, Camcorder, or Other Device

To transfer video, such as a movie that you've created, from your computer to another device, you use the TV Out port. Connect the video output adapter to the TV Out port. This adapter splits into two connectors, one for an S-video and one for a Composite video cable. Connect the cable from your video device to the appropriate connector.

Figure 3, Connecting a videio output adapter

For information about which input connector on your video device to use, see your video device documentation.

For information about using the video editing software to transfer your movies or graphics to another video or display device, see the AvidCinemafile.pdf file on your hard disk.

Recording and Transferring Sound

To record or output sound with your video, you must connect your computer's sound input and output ports to the appropriate sound connectors on your VCR, camcorder, or other device.

The sound ports on your computer require stereo mini-plug connectors. Check the type of audio connectors that your VCR, camcorder, or other video device requires. You can purchase sound cables from your Apple-authorized dealer.

For more information about connecting the sound cables to your computer, choose About Your Macintosh from the Help menu on your computer. For more information about connecting sound cables to your video device, see the video device documentation.

Figure 4, Types of sound cables

Upgrading Your Card's Memory

Your ATI Xclaim VR card comes with 4 megabytes (MB) of synchronous graphic random-access memory (SGRAM) installed. You can upgrade the card by adding a 4 MB SGRAM memory module in the video memory slot. Adding more memory allows the graphics card and display to use higher resolutions than 1024 X 1248 dpi. For more information about upgrading your ATI Xclaim VR card, contact ATI Technologies (**http://www.atitech.com**) or your Apple-authorized dealer.

Figure 5, Location of video memory slot on ATI Xclaim VR graphics card

QuickTime: Embedding and Serving Movies with Mac OS X Server

This article lists the steps you must go through to create movies using Final Cut Pro and embed them into a Web page being served by Mac OS X Server. Below is a summary of the overall process, followed by step-by-step instructions.
This article has been archived and is no longer updated by Apple.
How to serve embedded QuickTime Streaming Movies using QuickTime Streaming Server (QTSS) and Mac OS X Server.

How QuickTime Streaming Works

When a client uses a web browser such as Navigator or Internet Explorer to view a web page that contains streaming movies, a whole chain of events occurs which makes it possible for the user to actually see the movies. A brief understanding of these events should make it clearer why the steps we follow in this article are necessary.

1. A user clicks on a link to your Web page. An HTTP command is sent to the Mac OS X Server hosting your page.

2. The Apache server software running in the background on the Mac OS X Server intercepts the HTTP command and returns to the user a web page with a Referencing Movie embedded in it.

3. The Referencing Movie contains an RSTP command, which in turn is sent to the QuickTime Streaming Server software, also running in the background on the same Mac OS X Server.

4. The QTSS software intercepts the RTSP command, substitutes the Referencing Movie with the requested streaming movie, and sends it to the user.

An Overview of Setting Up Your Movies for Streaming

This article covers, in brief, how to create movies for QTSS streaming, (using Final Cut Pro as an example) and then shows into which directories they'll be placed on your Mac OS X server in order to make them accessible. Before moving on to the actual step by step details, here is an overview of the process as presented in this document.

1. On your video editing workstation, edit your video clip using an application such as Final Cut Pro (FCP). After editing, export a self-contained movie that has been both compressed and hinted (explanation below) using either FCP or the Quicktime Player.

2. Make sure the QuickTime Streaming Server software is installed on the Mac OS X server you'll be using as your HTML server. SeeVerifying Installation.

3. Place your compressed and hinted movies into the Media Directory (default is /Local/Library/QuickTimeStreaming/Movies) of your Mac OS X Server. This directory is specified by the QuickTimeStreamingAdministration application, and can differ from the default directory presented above.

4. Using the methods outlined below, create referencing movies from the streaming movies you just placed into the Media Directory.

5. Use standard HTML Quicktime embed tags to link the referencing movies you just created to your web pages. Place both the HTML pages and the referencing movies into the Webserver/Documents directory (default is /Local/Library/WebServer/Documents).

Make the Movies (Using Final Cut Pro):

1. Edit your movies in Final Cut Pro.

2. Once you're finished editing your final sequence, select it and choose Export Quicktime Movie from the File menu. The following dialog box appears:

Figure 1, Export Quicktime Movie dialog box

3. Click the Options button and the following dialog box appears. The compression settings shown in this document are for example purposes only. You are encouraged to experiment on your own to find the optimal settings for your application.

Figure 2, Movie Settings dialog box

- In Video Settings, you can pick Sorensen or Cinepak. 12fps is a common frame rate for compressed movies playing over high-speed lines. The target data rate is up to you, but 90-40 Kbs or smaller is recommended for movies compressed with the Sorensen codec. This number varies depending on what kind of Internet connection your target audience has.
- Leave Filter unchanged.
- Set your Frame Size to be 320x240 or smaller (256 x192 is popular).
- In Sound Settings, use the Qdesign Music 2 codec, with the Sample rate set to 22.050 kHz, and the Sample size set to16 bit.
- Finally, in the "Prepare for Internet Streaming" section, choose Hinted Streaming from the default menus.

4. Click OK, then Save. The final movie renders and you have a movie that's ready to be served.

Locating Your Movies and Pages on the Server:

1. Once your movies are finished, use your favorite Web page design tool to create the Web pages your movies will live in. Use the embed tags to actually place the movies on the page. See Embedding QuickTime.

2. Now you're ready to copy the appropriate files into the appropriate places.

Note: All the HTML pages you create refer to the location of both graphics files and movie files by relative pathnames. This is a UNIX convention, and works the same way as putting graphics files into a Web page.

For example, when creating pages, use one folder to hold all the documents you'll be linking together for your web site. We'll call this folder "WorkDirectory." Directly inside this folder will be your index.html page, (this is the first page that will load when someone accesses your Web site) and then that page links to other pages and files either in this folder or inside of other folders located inside of WorkDirectory. It is a good idea to keep all your streaming movies together inside their own folder. We'll call this folder "myMovieFiles," and it also is located inside of WorkDirectory.

When you use the Quicktime embed tags to place a streaming movie directly into a page, it looks something like this:

```
<p><embed src="myMovieFiles/pq_hinted.mov" autoplay="false" controller="true"
cache="true" width="256" height="192"></center><p>
```

Where the text myMovieFiles/pg_hinted.mov is a path name that specifies that the embedded movie is located in the folder (or directory, in Mac OS X speak) myMovieFiles, which is inside the current directory. This means when you copy the nested set of files and folders from your WorkDirectory folder onto the server, as long as you don't change any file or directory names, all the HTML code works unaltered.

Here's another example path:

```
folder1/folder2/fileName.mov
```

Which is the same as saying that fileName.mov is inside of folder2, which in turn is inside of folder1.

3. In order for the server to be able to serve your pages properly, you must have all your files in the right places. All HTML pages, your index.html page and other directories containing pages, images, and movies linked to your index.html page, all get copied into the directory on the Mac OS X Server partition called:

```
/Local/Library/WebServer/Documents
```

Note: Mac OS X Server is case sensitive, so directory and file names must be typed exactly as they appear. It's also very important not to change the names of any of the files or directories that you copy onto the server, or otherwise change the way things are organized by moving files from one directory to another. (There is one exception, noted below.) If you do, you're going to have to edit the pages manually on the server using a text editor, renaming all the paths to reflect the changes in name and location that you made.

4. There's one important exception to the above. All the hinted QuickTime movies you embedded in your web page, (which you put inside the myMovieFiles folder on your authoring computer) go inside the media folder you specified when you configured the QuickTime Server software. The default directory for the Quicktime Streaming Server software is:

```
/Local/Library/QuickTimeStreaming/Movies
```

If you don't put your hinted movies into this directory, they won't stream. In order for your web pages to still have these movies embedded, however, you'll need to place referencing movies into the myMovieFiles directory now located in the WebServer/Documents directory. These referencing movies point to the movies now located in the QuickTimeStreaming/Movies directory, enabling everything to work the way it should.

5. Make your referencing movies.

A referencing movie is a movie that selects another movie to play in its place. Referencing movies are very small, consisting only of an instruction which points to the original movie file located in `/Local/Library/QuickTimeStreaming/Movies`.

You create a referencing movie by following these steps:

1. Ensure your hinted movie into the QTSS Media Folder on the server.

2. From a remote computer, open the Quicktime Player, choose Open URL from the File menu, and type `rtsp://server.com/myMovie.mov` in the resulting dialog box, where `myMovie.mov` is the name of the served movie you want to make a referencing movie of.

3. The Quicktime Player informs you that it is connecting, buffering, and negotiating. Then, when the movie starts to play, choose Save As from the File menu and click Self Contained Movie.

4. The resulting Quicktime movie is the referencing movie, and it should be copied back into the directory that you originally placed all the hinted movies, myMovieFiles.

With these steps completed, the final test is to load the page using a browser on a remote computer and see if the movie loads properly.

iMac 333: Technical Specifications

This article contains the technical specifications for the iMac 333 announced on April 14, 1999. For a full description of this iMac please see article 58319: **iMac 333: Description**.
This article has been archived and is no longer updated by Apple.

Technical Specifications

Processor and memory

333-MHz PowerPC G3 processor

512K backside level 2 cache on processor module; 133-MHz dedicated 64-bit backside bus

66-MHz system bus Integrated floating-point unit and 64K on-chip level 1 cache (32K data and 32K instruction)

32MB of SDRAM (3.3-volt, unbuffered, 64-bit wide, 144-pin, 10-nanosecond cycle time); two SO-DIMM slots support up to 256MB

64-bit memory bus

Storage

Internal 6GB IDE hard disk drive

Internal 24x-speed (maximum) CD-ROM drive

Interfaces

Connectivity

-Two high-speed Universal Serial Bus (USB) ports (12 Mbps), which support USB devices such as keyboard, mouse, printer, storage devices, and USB hubs

Communications

-Built-in 10/100BASE-T Ethernet connector (RJ-45)

-Built-in 56K modem supports K56flex and V.90 standards (RJ-11 connector)***

Display

Multiple-scan, tiltable shadow mask color display: 15-inch (13.8-inch diagonal viewable image size), .28-mm dot pitch

Refresh rate of up to 117 Hz

Graphics support

Built-in 2D/3D graphics acceleration through an integrated ATI RAGE Pro Turbo graphics controller 6MB of SGRAM video memory

Supports millions of colors at up to 1,024- by 768- pixel resolution (24-bit)

Sound

Two built-in stereo speakers with SRS surround sound

Built-in microphone

Two front headphone jacks

Minijacks for 16-bit CD-quality stereo input/output; 44.1-kHz sampling rate

Keyboard and mouse

Apple USB Keyboard

-Two-position adjustable slope (0° and 6°)

-Serves as USB hub with two USB ports

-Power consumption 100 mA maximum

Apple USB Mouse

-Power consumption 100 mA maximum

Electrical requirements and agency approvals

Line voltage: 100V to 240V AC

Frequency: 50 to 60 Hz, single phase

Power: 200W maximum, continuous

EPA ENERGY STAR compliant

Environmental requirements

Operating temperature: 50° to 104° F (10° to 40° C)

Storage temperature: -40° to 149° F (-40° to 65° C)

Relative humidity: 20% to 90% noncondensing

Maximum altitude: 10,000 feet (3,048 m)

Size and weight

Height: 15.8 inches (39.5 cm) with foot extended Width: 15.2 inches (38.0 cm)

Depth: 17.6 inches (44.0 cm)

Weight: 38.1 pounds (17.3 kg)

*** Data speeds up to 56 Kbps, fax speeds up to 14.4 Kbps. Download speeds vary with line conditions and your ISP's modem capabilities. FCC regulations limit ISP transmission speeds to 53 Kbps in the U.S.

iMac 333: Description

This article contains a description of the iMac 333 introduced on April 14, 1999. For a full list of Technical Specifications refer to article number 58317: **iMac 333: Technical Specifications**.
This article has been archived and is no longer updated by Apple.
iMac is, quite simply, an outrageously attractive, surprisingly affordable, and extraordinarily easy-to-set-up-and-use system. It comes fully loaded, but brings along none of the hassle you might associate with the word computer. Get ready for the excitement of swift, simple Internet access-your passport to a world of information. And the thrill of playing a game so richly detailed you actually feel like you're in another world. Then consider the fact that iMac delivers significantly more power than you'd expect from a computer at such a great price.

Just looking at iMac tells you this is a different kind of computer. Apple's attention to detail is clearly demonstrated in every aspect of its product design-from the built-in monitor with crystal-clear focus, to the translucent mouse that responds to the slightest touch, to the integrated stereo speakers. And iMac is now available in five dazzling colors-blueberry, strawberry, tangerine, lime, and grape-that will dress up your home office, add a tasteful touch to your kitchen, or class up your college kid's dorm room.

But its award-winning design isn't all that makes iMac a best-seller. Beneath its jaw-dropping exterior, iMac is a rocket of a computer. Its PowerPC G3 processor, integrated 3D graphics accelerator, and 6MB of video memory make it lightning fast. It features USB, the new high-speed connection standard that lets you easily attach peripherals such as printers, digital cameras, game pads, joysticks, or storage devices-without shutting down and restarting your computer. To handle all your communications needs, iMac comes with a speedy 56K internal modem for dial-up connections and quick, easy Internet access. *** It also includes built-in high-speed Ethernet, which not only provides efficient L AN connections, but makes iMac ready to handle even faster communications technologies in your home, such as DSL and cable modems.

Whether you're a first-time computer user or a highly experienced one, iMac-with its powerful, state-of-the-art (and beyond) features and simplicity of setup and operation-is the ideal choice. It will let you do the things you want to do with a computer, and many things you may only have dreamed about.

Features

Affordable high performance

- Features the advanced PowerPC G3 processor with performance-boosting backside level 2 cache
- Provides state-of-the-art Universal Serial Bus (USB) plug-and-play peripheral connectivity
- Delivers high-speed networking for LAN or Internet use
- Includes the accelerated ATI RAGE Pro Turbo graphics controller and 6MB of video memory, which provides rich 3D texture rendering for the latest games

Advanced styling and remarkable attention to detail

- Features a stunning overall product design
- Offers you a choice of five dazzling colors
- Incorporates a high-quality monitor with minimal flicker and crystal-clear focus
- Comes with a height-adjustable, space-efficient USB keyboard and a sleek, round USB mouse
- Elegantly routes cables to avoid clutter and confusion
- Is amazingly compact, with an integrated handle that makes it easy to transport

Simple to set up and simple to use

- Provides striking simplicity of setup and use through integrated system elements such as a built-in monitor, stereo speakers, and a modem
- Puts you on the Internet quickly and easily
- Includes the Mac OS-the world's easiest-to-use system software-and runs the thousands of Mac-compatible programs available today
- Comes with a number of applications, including AppleWorks, Microsoft Internet Explorer and Outlook Express, Netscape Navigator, EarthLink TotalAccess,* FAXstf, Quicken for Macintosh Deluxe 98, Nanosaur, Williams-Sonoma Guide to Good Cooking, World Book Macintosh Edition, EdView Internet Safety Kit Family Edition, Adobe PageMill, and Kai's Photo Soap SE**

Ordering Information
M7441LL/A iMac-Strawberry
M7444LL/A iMac-Lime
M7443LL/A iMac-Tangerine
M7442LL/A iMac-Grape
M7740LL/A iMac-Blueberry

All models include:
Apple USB Keyboard

Apple USB Mouse
Mac OS preinstalled
The following software applications:**
-AppleWorks
-Microsoft Internet Explorer
-Microsoft Outlook Express
-Netscape Navigator
-Adobe PageMill
-EarthLink TotalAccess*
-EdView Internet Safety Kit, Family Edition
-FAXstf
-Quicken for Macintosh Deluxe 98
-Kai's Photo Soap SE
-World Book Macintosh Edition
-Nanosaur
-Williams-Sonoma Guide to Good Cooking

* TotalAccess software includes EarthLink 30-day free trial offer; setup fee is waived. Internet access requires an Internet service account.
** Most applications are preinstalled. Some applications require use of included CD-ROM. Product contains electronic documentation. Backup software provided on CD-ROM.
*** Data speeds up to 56 Kbps, fax speeds up to 14.4 Kbps. Download speeds vary with line conditions and your ISP's modem capabilities. FCC regulations limit ISP transmission speeds to 53 Kbps in the U.S.

PowerBook: Uses Manual Eject PC Card Mechanism

The PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire), and PowerBook G4 use a manual eject PC card mechanism that has different operating characteristics than the auto eject mechanism used in other PowerBook computers.
This article has been archived and is no longer updated by Apple.
The PC card eject procedure is slightly different from other PowerBook computers. The card does not automatically eject when you drag its icon from the desktop to the Trash. Do not eject a PC Card when the computer is asleep. If you do, you'll see a message to reinsert the card when you wake the PowerBook.

To eject a PC card:
1. Drag the card's icon to the Trash.
2. Depress the small button on the rear edge of the PC card slot once to release the eject arm.

Figure 1 Releasing the eject arm.

3. Push the eject arm a second time to eject the PC card .

Figure 2 Ejecting the PC card.

4. Remove the card from the PowerBook .

Note: Before inserting a PC card into the PowerBook, ensure the eject arm is not released. If it is, simply press it back in prior to inserting the PC card.

If a message states that the PC Card is in use:

1. Quit all applications to make sure that the PC Card is not being used.
2. Drag the card's icon to the Trash again.
3. Make sure the AppleTalk control panel is not set to use the card.
4. Attempt to eject the card again.

PowerBook G3 Series (Bronze Keyboard): Upgrading Memory

Memory upgrade information for the PowerBook G3 Series (Bronze keyboard) computer.
This article has been archived and is no longer updated by Apple.
Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, please see the following article:

Article 24604: "**PowerBook G3 & G3 Series: Identifying Different Models**"

For information on upgrading memory in a PowerBook G3 Series computer, see the following article:

Article 25002: "**PowerBook G3 Series: Upgrading Memory**"

The PowerBook G3 Series (Bronze keyboard) uses the same memory as the PowerBook G3 Series and iMac, with a maximum of 384 MB supported. There are two available slots for memory upgrades - instructions for installing memory in the upper slot are outlined in this document. The lower slot can be upgraded by a service provider only. The 128 MB configuration from Apple may use one-128 MB module or two-64 MB modules. Before ordering memory, ensure you have an available memory slot.

To verify your current memory configuration, open Apple System Profiler and click the System Profile tab. In the Memory Overview under the Built-in memory arrow it will describe how the Bottom and Top memory banks are configured.
Note: These directions are also available under the Help menu in the Help Center. Select the About Your PowerBook guide and refer to the Installing Memory section.

To upgrade the memory in your computer, follow these steps:

1. Remove AC power and the main battery.

2. Remove keyboard by first releasing the screw behind the port access door on the back of the computer (see Figure 1). Turn the screw 7 to 8 times counter-clockwise to release it.

Note: Apple does not ship the PowerBook with the keyboard locking screw engaged. As such, it may or may not need to be released prior to keyboard removal.

The screw will not come out of the computer. Once the screw is released, slide the two release latches along the function key row towards the front of the computer to release the keyboard (see Figure 2). Roll the keyboard towards you and rest it over the trackpad (see Figure 3).

Figure 1: Keyboard locking screw

Figure 2: Keyboard release latches

Figure 3: Keyboard removal

3. Remove the three screws holding the heatsink to the processor (see Figure 4). Use caution when removing the heatsink as the material on the processor may stick to the heatsink. Lift the front edge of the heatsink first, then remove it completely from the computer.

Figure 4: Heatsink removal

4. Install the memory card. When installing the memory, start at a 30 degree position and then push the memory card in and down slightly. You will feel a slight snap as the card locks into position. See Figure 6.

Figure 5: Memory card slot

Figure 6: Memory card installation

5. Reinstall the heatsink being careful not to damage clip holding the RAM card to the processor card. Refer to article 58405: "**PowerBook G3 Series (Bronze keyboard): Heatsink Reinstallation Tip**" for additional information on reinstalling the processor heatsink.

6. Reinstall the keyboard, again sliding the release latches back to allow the keyboard to be secured to the computer. Retighten the keyboard locking screw to secure the keyboard to the computer.

Note: When reinstalling the keyboard, make sure all the tabs on the leading edge are fully inserted into the corresponding slot (see Figure 7). Failure to do so may cause the keyboard tab to put pressure on the CD-ROM drive possibly causing a grinding noise when resting your hand on the palmrest when a CD is inserted.

Figure 7: Keyboard reinstallation

7. Turn the computer on and choose About This Computer from the Apple menu to ensure the memory is recognized.

Note: Care should be exercised when installing memory as this exposes components that are static sensitive. Use a grounded work area to discharge any static electricity on your body before handling memory. Damage caused by static electricity will not be covered by the Apple Limited Product Warranty.

PowerBook: Adjusting Volume, Brightness, Mute

The controls for screen brightness, volume, and muting have been moved to the function keys on the PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire), and PowerBook G4. By depressing the appropriate function key, you can adjust each setting.

This article has been archived and is no longer updated by Apple.
If you find that the keyboard commands are not working, open the Keyboard control panel, click Options, and deselect the "Make F1 through F12 the primary function keys" setting, or press the fn key on the keyboard while pressing the keyboard command.

Figure 1, Options dialog box

For more specific information on adjusting brightness, volume, and muting, see article number 58327: "**PowerBook: Using the Multi-function Keyboard**".

Published Date: Feb 20, 2012

PowerBook: Using the Multi-function Keyboard

The PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire) and PowerBook G4 have a multi-function keyboard. This article describes the different functions of the keyboard and how to utilize them.
This article has been archived and is no longer updated by Apple.
Your PowerBook comes with a built-in keyboard and trackpad. The keyboard includes:

- a numeric keypad incorporated in the PowerBook keyboard .
- controls to adjust the brightness of the display, and the volume of the PowerBook speakers and external audio port.

Using the Numeric Keypad

Your PowerBook keyboard has a built-in numeric keypad.

Figure 1 Numeric keypad and Num Lock key locations

To activate the numeric keypad:

Press the Num Lock key. When the keypad is active, the green light next to the key is on.

Using the Keyboard Control Panel

Mac OS 8.x or earlier

You can set up the keyboard in the Mac OS 8.x (using the Keyboard control panel) so the function keys are primary and the brightness, volume, and other controls are not active until you press the Fn key.

To do this, open the Keyboard control panel (Figure 2) and click the Options button. This will open the Options window (See figure 3).

Figure 2 Keyboard control panel

Figure 3 Keyboard control panel Options dialog box

By selecting the Function Keys checkbox, F1 through F12 become the primary function keys.

Example:

- With this button checked - you will have to hold down the Fn key while selecting the brightness up for it to work.
- With this button unchecked - you just press the brightness key and it will work.

Note: When the built-in keypad is activated, only keys used for the keypad are enabled. Keys not used in the numeric keypad and keyboard equivalents for menu commands are disabled.

Note: Using the key caps Desk Accessory is a great way to determine which mode the keyboard is in and which keys are active.

To turn off the numeric keypad: Press the Num Lock key.

Mac OS 9.x

You can set up the keyboard in the Mac OS 9.x (using the Keyboard control panel) so the function keys are primary and any programmed functions keys are not active until you press the Fn key.

To do this, open the Keyboard control panel (figure 4) and click the Function Keys button. This will open the Hot Function Keys window (See figure 5).

Note: If you have Mac OS 9.x installed on your computer and your control panel does not have the Function Key button, see article 60530: Mac OS 9: "**Using Programmable Keyboard Function Keys**" .

Figure 4 Keyboard control panel

Figure 5 Hot Function Keys window

By selecting the Hot Function Keys checkbox, F1 through F12 become the primary function keys.

Example:

- With this button checked - you just press the Eject CD key and it will work.
- With this button unchecked - you will have to hold down the Fn key while selecting the Eject CD key for it to work.

Also, you can program the function keys to help simplify common, everyday tasks performed on the computer. You can use these keys to open a browser, an email application, or any other frequently used application or server by pressing a single key.

To do this, open the Keyboard control panel (figure 4) and click the Function Keys button. This will open the Hot Function Keys window (See figure 5). Then just follow the instructions in the Hot Function Key Assignment section.

Note: The function keys F1 through F12 can be easily reset to have primary functionality. Simply open the Keyboard control panel and select Function Keys. Then deselect the box that says "Use F1 through F12 as Hot Function keys."

Note: Programmable function keys are not a feature of Mac OS X 10.0

Using the Keyboard Control Panel

Adjusting the volume

You can adjust the volume of the internal speakers by using the volume and mute keys on the PowerBook keyboard.

Figure 6 Volume keys on PowerBook keyboard

The volume control keys, along with the brightness and other keys, can also be used as function keys (F1 - F12). To use the keys as function keys, press the function (Fn) key.

Adjusting the brightness of the internal display

You can adjust the brightness of the internal display with the brightness keys on the PowerBook keyboard.

Brightness controls

Figure 7 Brightness control keys

The brightness control keys, along with the volume and other keys, can also be used as function keys (F1 - F12). To use the keys as function keys, press the function (Fn) key.

Locking your keyboard

To protect the internal components of your PowerBook G3 Series (Bronze keyboard), such as the memory module and hard disk, you can lock the PowerBook keyboard.

To lock the keyboard, use a flathead screwdriver to turn the keyboard locking screw clockwise 5 turns.

Figure 8 Keyboard locking screw on PowerBook G3 Series (Bronze keyboard)

Note: PowerBook (FireWire) keyboards have a locking screw located between the F4 and F5 keys. Turn the screw one half turn to lock or unlock the keyboard.

PowerBook G3 Series (Bronze keyboard): How to Differentiate From Other PowerBook G3 Series Computers

This article describes the differences between the PowerBook G3 Series (Bronze keyboard) introduced in May, 1999, and earlier PowerBook G3 Series computers.
This article has been archived and is no longer updated by Apple.
There are a number of visual cues for distinguishing the new PowerBook G3 Series. They are:

- The keyboard and trackpad button have a bronze or mocha color.
- The inside display bezel has a white Apple logo at the top.
- The rear ports are all enclosed by the I/O door and the modem port is now in the rear of the unit.
- There are two USB ports.
- It has a single, manual eject PC card slot which supports Type I and II PC cards.
- The display clamshell latch mechanism release is on the base of the PowerBook instead of the clamshell.

PowerBook (Bronze keyboard, FireWire and G4): LCD Functional When External Display Connected

The built-in display does function when an external display is connected to the PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire) or PowerBook G4.
This article has been archived and is no longer updated by Apple.
The PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire) or PowerBook G4 provide an image on both the built-in display and an external display connected to the VGA connector. The desktop is extended across both displays.

You can also mirror the image so both displays show the same information. This is useful when giving a presentation, for example. This capability is also available when using a television or other composite signal monitor connected to the S-video port.

Using an external display and/or TV out

To use an external display and/or TV out follow the following steps with the computer shut down or in sleep.

To connect an external monitor or other video device:

1. With the PowerBook shut down or in sleep, attach the end of the monitor cable to the video out port on the back of the PowerBook.

Figure 1, Video out port and icon

2. If you are connecting an older Macintosh-compatible monitor that does not have a VGA cable, attach the monitor adapter to the end of the external monitor's cable and plug the VGA-to-Macintosh adapter into the port as shown in the following illustration.

Monitor cable Monitor adapter

Figure 2, Attaching cable with monitor adapter

3. Turn on the external monitor and then press the Power button to turn on or wake your computer.

When you are finished using the external monitor, shut down your PowerBook or put it in sleep and turn off the monitor. Then disconnect the external monitor.

Switching to video mirroring

By default, your PowerBook starts up in dual display mode. You can use the Video Mirroring portion of the Control Strip to make the images on the PowerBook display and the external monitor the same.

Video Mirroring

Figure 3, Video Mirroring portion of the Control Strip

Displaying images on a television, VCR, or other device

The following steps must be done with the computer shut down or in sleep.

To connect a television to the computer:

1. With your PowerBook in sleep or shut down, attach one end of a S-video or composite video cable (not included with your computer) to the video-in port on the television.

2. Plug the S-video cable or composite video cable (attached to the composite to S-Video adapter included with your computer) to the TV out port on your computer.

Figure 4, TV out port and icon

3. Turn on the television and then press the Power button to turn on or wake your computer. TV Mirroring should turn on automatically after you wake or start up the computer. When you are finished using the television, shut down or put the computer in sleep and disconnect the cable.

Published Date: Feb 20, 2012

PowerBook G3 Series (Bronze keyboard): No Sleep When IrDA Selected

A PowerBook G3 Series (Bronze keyboard) does not go into sleep mode when IrDA is selected in the AppleTalk control panel.
This article has been archived and is no longer updated by Apple.
This is normal operation when IrDA is selected. The computer must be awake to monitor the infrared port for incoming data, similar to telling the modem to wait for an incoming call.

You can force the computer to enter sleep mode through the Special menu or by pressing the Power key and selecting Sleep from the dialog box presented.

PowerBook G3 Series (Bronze keyboard): Target Disk Mode Requires System Folder on Internal Drive

The PowerBook G3 Series (Bronze keyboard) is capable of functioning in Target Disk Mode.

This article has been archived and is no longer updated by Apple.
Target Disk Mode works as long as a valid System Folder is installed on the internal hard disk. You can access Target Disk Mode through the PowerBook SCSI Setup control panel.

Published Date: Feb 20, 2012

PowerBook G3 Series (Bronze keyboard): What‘s New and Different

This article tells what is new and different about the PowerBook G3 Series (Bronze keyboard).

This article has been archived and is no longer updated by Apple.
Here are brief descriptions of the new and unique features of the PowerBook G3 Series (Bronze keyboard).

Built-in Universal Serial Bus (USB)

Connect keyboards, mice, joysticks, speakers, modems, and other external peripherals to your PowerBook G3 Series (Bronze keyboard) through the two built-in USB ports.

ROM-in-RAM

Enables Apple to update the Mac OS ROM via software downloads.

Built-in DVD decoding available

With the DVD-ROM drive and decoder, you can watch DVD movies on your PowerBook.

Note: Because the DVD decoder is installed on the logic board, DVD capability is only available only at time of order, no upgrade to DVD functionality is available.

10/100 base-T Ethernet

Using Cat5 cabling and the appropriate hub or network card, connect to a network or other 100 base-T computer at maximum speed.

Able to operate with the clamshell closed

With an external USB keyboard and mouse, and an external display connected, you don't have to use your PowerBook's built-in display.

Revised clamshell latch

To avoid accidentally opening the clamshell of your PowerBook, the release mechanism is now on the base of the PowerBook rather than on the display.

Revised expansion bay latches

To avoid accidentally ejecting an expansion bay device, the latch now releases near the end of its travel rather than at the beginning.

Faster processors

Available PowerPC G3 processors up to 400 MHz.

Miscellaneous

Comes with Mac OS 8.6.

Bigger hard disk drives.

Single manual eject PC card slot supporting Type I and Type II PC cards.

8 MB VRAM enables video support for external displays at more resolutions, and simultaneous use of built-in and external displays.

Translucent keyboard.

The sound and display controls are now integrated into the keyboard function keys.

Published Date: Feb 20, 2012

PowerBook (Bronze keyboard): How to Operate with Clamshell Closed

This article tells how the PowerBook G3 Series (Bronze keyboard) can be used with the display clamshell closed and an external monitor attached.
This article has been archived and is no longer updated by Apple.
If you have an external keyboard that has a power button follow the instructions below. (These instructions will not work with the Apple Pro Keyboard.)

1. Place your PowerBook in sleep mode by closing the display.
2. Connect your power adapter and external display.
3. Connect the Apple external USB keyboard and mouse, and then press the Power button on the keyboard to wake the PowerBook.

To activate the internal display again, put the PowerBook to sleep and wake it with the display open.

Notes:

1. If you are using your PowerBook with the clamshell closed, you cannot utilize Video Mirroring. If you have both a VGA and S-Video source connected to the PowerBook, it shows an image only on the VGA device.
2. Connecting an external display increases the power requirements of the PowerBook. Therefore you should use the AC adapter whenever you are connected to an external display.
3. To wake the PowerBook from sleep from an external keyboard (such as when you are running with the clamshell closed), you must press the power key on the external keyboard. Other keys on the external keyboard do not respond when the PowerBook is truly asleep. In contrast, if the PowerBook has simply spun down the hard disk and dimmed the display (but is not completely asleep), then the PowerBook wakes from any key pressed on the external keyboard.
4. External keyboards without a power button, such as the Apple Pro Keyboard, will not wake in closed clamshell mode.

iBook: Read Me

This article contains the Read Me document included with iBook.
This article has been archived and is no longer updated by Apple.
Important Information About Your iBook

This document contains important late-breaking information about your iBook computer. You may want to print this document and keep it with your other printed iBook documentation. For additional information, see Mac Help and the print and online documentation that came with your computer. Apple also provides substantial information online. If you have access to the World Wide Web (WWW), you can check the latest information about iBook in the support area at the following Uniform Resource Locator (URL): **http://www.apple.com/support/ibook**

The following topics are covered in this document:

Using your iBook
Starting up: The Mac OS ROM file
Selecting a startup disk
Keeping Virtual Memory on for computers with 32 MB of RAM
Preserving the contents of memory before sleeping your computer
Allocating memory for third-party applications
Trouble connecting the internal modem in V.90 mode
Formatting external USB (Universal Serial Bus) hard disk drives
Copying and pasting alert sounds
Adjusting and testing external speakers
Adjusting the volume for audio CDs and CDs with audio
Playing and recording from audio CDs
Connecting to a 10/100Base-T network
Performance problems using Ethernet
Connecting your computer directly to an Ethernet switch
Using the "Wake for other network activity" option in the Energy Saver control panel
Using a RAM disk
Using your computer with a NetBoot Server
Password Security control panel

Third-party software issues
Moving Bookmarks and Favorites files before reinstalling Internet Explorer and Netscape Communicator
Using hard disk utilities and disk-locking programs
Using Virtual PC 2.1.3
Using fax software
Using the internal modem with third-party software
Using Palm Desktop Software 2.5
Setting up AOL when the Palm Desktop Software 2.5 is installed
Removing two extensions after installing Quake 1.08
FWB Hard Disk Toolkit 3.0.2
EdViewTM Internet Safety Kit

Hardware compatibility issues
Connecting USB devices while the computer is asleep
Mounting and disconnecting USB storage devices
Using USB devices with software applications
Using ADB dongles
Using USB-to-serial converters

Documentation changes
References to Monitors & Sound Control Panel in Mac Help
Mac Help instructions for modifying a remote access configuration

Using your iBook

Starting up: The Mac OS ROM file
The System Folder contains an important file-Mac OS ROM. This file is required for your computer to properly start up. If you delete this file or move it to another folder, your computer will not successfully start up.

Selecting a startup disk
Make sure a valid startup disk is selected in the Startup Disk control panel. If an invalid startup disk is selected (one your computer cannot start up from), your computer could take as long as two minutes to locate a valid startup disk and properly start up. A RAM disk cannot be used as the startup device, even though its icon may appear in the Startup Disk control panel.

If you have selected a CD as the startup disk in the Startup Disk control panel, and you start up your computer without a CD or with a CD other than the software install or software restore CD that came with your computer, a single folder with a reappearing question mark appears on the screen. The computer will search for a System Folder and start up. If no System Folder is available, you must insert the software install or software restore CD that came with your computer and restart your computer. If you don't want to start up from a CD, make sure you select another startup disk, such as the hard disk, as the startup disk in the Startup Disk control panel.

Selecting the Network Disk icon in the Startup control panel without having a Netboot server properly set up will also significantly delay the time it takes your iBook to start up.

Keeping Virtual Memory on for computers with 32 MB of RAM
If your computer has 32 megabytes (MB) of random-access memory (RAM), Apple recommends you do not turn Virtual Memory off in the Memory control panel. (To see how much built-in memory is available, open the Apple menu and choose About This Computer.)

If you accidentally turn off Virtual Memory and have problems starting up your computer, do the following:
1. Restart your computer while holding down the Shift key.
2. Open the Apple menu, select Control Panels, then choose Memory.
The Memory control panel opens.
3. Under Virtual Memory, click the On button, then click the close box to close the control panel.
4. From the Special menu, choose Restart.
Once your computer restarts, Virtual Memory is on.

Preserving the contents of memory before sleeping your computer
You can save the contents of memory to the computer's hard disk before your computer goes to sleep using the Advanced settings section of the Energy Saver control panel (for more information, see Mac Help). After you close the lid to put your computer to sleep, don't move the computer for approximately 20 seconds. When the save process is complete, the sleep indicator light blinks.
Important: You must have Virtual Memory turned on in the Memory control panel, in order for this option to work.

Allocating memory for third-party applications
Some third-party applications need to have a larger memory allocation than the default amount to run or print properly. Select the application's icon. From the File menu, select Get Info and from the pop-up menu, choose Memory. In the Memory Requirements section, increase the preferred memory size. For more information on increasing the amount of memory for an application, see the topic "Adjusting your memory usage" in Mac Help.

Trouble connecting the internal modem in V.90 mode
Your iBook comes with an internal 56K modem, based on the V.90 specification. If you're having problems connecting in V.90 mode-if the modem won't connect at all or the connection is dropped after a few minutes-the phone lines might be too noisy or there might be too much interference to sustain a connection at speeds above 33.6 kilobits per second (Kbps). Contact your ISP to ensure that it is using V.90 compliant modems or plans to update to them in the near future. Use the Apple Internal 56K Modem (V.34) modem script, which forces the modem to connect at 33.6 Kbps or lower speeds. This type of connection is more reliable in situations where the phone line quality is questionable.

To select the Apple Internal 56K Modem (V.34) modem script, follow these steps:
1. Open the Modem control panel in the Apple menu.
2. Make sure the "Connect via" pop-up menu is set to Internal Modem.
3. Open the Modem pop-up menu and choose Apple Internal 56K Modem (V.34).
4. If necessary, set the Sound and Dialing options.
5. Close the control panel.
A message asks if you want to save the changes to the current configuration.
6. Click Save.

Note: You do not have to restart your computer to use this modem script.

Formatting external USB (Universal Serial Bus) hard disk drives
Many USB hard disk drives are DOS-formatted at the factory. You can use DOS-formatted USB hard drives with your computer, but you will get much better performance if the USB hard drive is formatted as Mac OS Extended or Mac OS Standard. To reformat the hard drive to Mac OS Extended or Mac OS Standard format, use the formatting utility that came with the USB hard drive. If you do not have a formatting utility, you can change the drive to Mac OS format by following the steps below.

WARNING Erasing the hard drive will destroy any data stored on the drive.

1. If you haven't already done so, connect the external USB hard drive to your computer and turn it on.
For more information, see the topic "Connecting USB devices to your computer" in Mac Help and the documentation that came with the device.
2. Open the Apple menu, select Control Panels, then choose File Exchange.
The File Exchange control panel opens.
3. If necessary, click the PC Exchange tab.
4. Click the checkbox next to Mount at startup. (The checkbox should be blank.)
This turns off PC Exchange.
5. Click the close box to close the control panel.

6. Click the USB drive's icon on the Desktop, then from the Special menu choose Erase Disk.
A window appears.
7. From the Format pop-up menu, select Mac OS Extended or Mac OS Standard format, then click Erase.

Copying and pasting alert sounds
Long alert sounds require large amounts of memory. If you have difficulty copying and pasting long alert sounds into the Sound control panel, you may need to adjust memory requirements for the control panel. To do this, open the Control Panels folder within the System Folder. Select the Sound control panel. From the File menu, select Get Info and from the pop-up menu, choose Memory. In the Memory Requirements section, increase the preferred memory size until you are able to copy and paste the alert sound. The amount of memory needed depends on the sound quality of the sound input device you are using.

Adjusting and testing external speakers
The Speaker Setup section of the Sound control panel allows you to adjust the speakers connected to your computer. Use the Speaker Setup panel to select which speakers you want to use and to adjust the relative volume for each speaker. For example, if you have a subwoofer connected to your computer and want to adjust the volume for the subwoofer only, use the slider underneath the subwoofer to change the volume.

You can also test the speakers connected to your computer by clicking Start Test in the Speaker Setup section. The computer plays a "white noise" test tone on each speaker, allowing you to adjust the relative volume of that speaker. The "white noise" test tone contains sound for all frequencies and sounds like static. You should reduce the overall sound volume for your computer using the Output section of the Sound control panel before testing your speakers, as the test tone can be quite loud on some speakers.

Adjusting the volume for audio CDs and CDs with audio
If you can't hear the audio on a CD, try turning up the volume level in the AppleCD Audio Player. If that doesn't work, check that the Mute option is not selected in the Output section of the Sound control panel. If you started up your computer from a CD with system software, the volume for the AppleCD Audio Player might be set to zero.

Playing and recording from audio CDs
Audio CD playback is now done digitally for increased fidelity and use with digital audio peripheral devices. When you play audio CDs, you no longer have to select "Internal CD" in the Input section of the Sound control panel or the Sound section of the Control Strip. To record from an audio CD, you may need to select "Internal CD" in the Input section of the Sound control panel or the Sound section of the Control Strip.

Connecting to a 10/100Base-T network
When you connect your iBook to an Ethernet network, the computer automatically senses whether it is connected to a 10Base-T network or to a 100Base-T network. Some (possibly all) ports on some network hubs/switches support both speeds. If you're using this type of hub/switch, there may be a delay in establishing a network link. The delay may last for several seconds after you start or restart the iBook, and a message may appear saying the network is not available or that the network has only just become available. If you don't want a delay, connect your computer to an Ethernet network port that is not auto-sensing (10 or 100 megabits per second (Mbps) only). For more information, contact the manufacturer of the Ethernet hub/switch or your network administrator.

Performance problems using Ethernet
If you experience performance problems on your Ethernet network, check with your network administrator. Your computer performs best when the Ethernet port is set to auto-negotiate.

Important: The duplex mode of an Ethernet link to a switch is not detected if the switch's port is not auto-negotiating. If the switch's port is not auto-negotiating, your computer will detect the proper speed but default to half-duplex. If the switch's port at the other end of the link is configured for full-duplex, a large number of late events can occur on the link. Set the switch's port to auto-negotiate where possible. If this isn't possible, then set the switch's port to half-duplex. For more information, see the documentation that came with the Ethernet hub.

Connecting your computer directly to an Ethernet switch
If you connect your iBook directly to an Ethernet switch, you must disable spanning tree on that port. Otherwise your computer could duplicate the AppleTalk address of another computer on the same network and both network connections would become unreliable.

Using the "Wake for other network activity" option in the Energy Saver control panel
In the Energy Saver control panel, the "Wake for other network activity" option requires that an application using TCP/IP be open on your computer for this feature to function properly. You cannot just uncheck the "Load only when needed" option in the TCP/IP control panel.

Using a RAM disk
A RAM disk allows you to use part of the built-in random-access memory (RAM) in your computer as a high-speed storage disk. To save power when your computer is using battery power, you can use a RAM disk to store the documents you are working on. To set up a RAM disk, use the Memory control panel. For more information, see the topic "Improving performance of disk-intensive programs" in Mac Help.

Note: The contents of a RAM disk are saved to the startup disk when you restart your computer. Once the computer restarts, the contents are restored. Large RAM disks may add additional time to shutting down and restarting the computer.

Warning: You should regularly back up the contents of your RAM disk to another disk. The contents of the RAM disk can be lost if:

- the startup drive is read-only, such as a CD-ROM disc
- the startup drive does not have sufficient space to store the contents of the RAM disk

- the startup drive does not have a valid System Folder
- the computer loses power

Using your computer with a NetBoot Server
If you want to use your iBook as a NetBoot client, you may need to update the system on the NetBoot Server. Check the Mac OS X Server Web site at www.apple.com/macosx/server or the Apple Support Web site at www.apple.com/support for instructions.

Password Security control panel
The Password Security control panel mentioned in Mac Help was designed to work with older PowerBook computers and is not installed on your iBook.

Third-party software issues

Moving Bookmarks and Favorites files before reinstalling Internet Explorer and Netscape Communicator
If you inadvertently delete the Internet Explorer or Netscape Communicator applications, you can reinstall the applications using the software install CD that came with your computer. Before you reinstall Internet Explorer or Netscape Communicator, you must move the file that contains your Internet sites list to a different location, such as the desktop. In Internet Explorer, this file is Favorites.html; in Netscape Communicator, the file is Bookmarks.html. When you reinstall Internet Explorer or Netscape Communicator, the program overwrites these files and any locations or bookmarks that you added or that were preinstalled will be lost.

Using hard disk utilities and disk-locking programs
Some disk utility and disk-locking programs are incompatible with Mac OS Extended format. Before you use a disk utility or disk-locking program, make sure the version you have is compatible with Mac OS Extended format. Check the documentation that came with the software application or contact the software manufacturer.

Using Virtual PC 2.1.3
Virtual PC 2.1.3 does not work with iBook computers that have 32 MB of RAM. If you want to use this software, you'll need to add more RAM. For more information, contact the software manufacturer.

Using fax software
If your fax software is set to auto answer, the screen will dim but your computer will not go to sleep. To allow your computer to sleep, you must disable FAXstf auto-answering. To do this, open FaxBrowser, select Settings from the Edit menu. Then select the FaxModem icon and select Never from the Answer On pop-up menu.

Note: To avoid draining your computer battery, plug in the power adapter when waiting to receive a fax.

Using the internal modem with third-party software
Some third-party software, such as FaxSTF or Total Access, have different modem selections than the ones found in the Modem control panel. Using these selections can slow down your connection speed. To use these programs with your computer's internal modem at its highest speed, make sure you select Apple Internal 56K Modem (V.90) in the Modem control panel.

Using Palm Desktop Software 2.5
If you make a connection and a sync fails or doesn't complete, set the connection speed to a lower setting. To do this, open HotSync Manager (click the icon next to the Applications menu, choose HotSync, and in the pop-up menu, select Setup). Click the Serial Port Settings tab. In the Local Setup section, select 19200 as the speed.

Setting up AOL when the Palm Desktop Software 2.5 is installed
If you installed the Palm Desktop Software 2.5 on your computer and you attempt to set up AOL, there is a conflict and a message may appear saying you have a "port in use" error. You need to disable HotSync so you can properly set up AOL. To do this, open HotSync Manager (click the icon next to the Applications menu, choose HotSync, and in the pop-up menu, select Setup). If necessary, click the HotSync Controls tab. In the HotSync section, click the button next to Disabled. To obtain the latest version of AOL software, connect to AOL and go to the keyword Upgrade.

Removing two extensions after installing Quake 1.08
The Quake-1.08 Installer installs two extensions on your computer-ATIGraphicsAccel 2.0f1-CW and ATIGraphicsAccel 1.2f5-CW. After you install Quake and before you restart your computer, drag these two files from the Extensions folder, within the System Folder, to the Trash. If you restart your computer without deleting these two files, your computer may freeze. If that happens, start up your computer from the software install or restore CD, delete the two extensions, then choose Restart from the Special menu.

FWB Hard Disk Toolkit 3.0.2
FWB Hard Disk Toolkit 3.0.2 is not compatible with this model of iBook computer. For more information, contact the software publisher.

EdViewTM Internet Safety Kit
The version of EdView Internet Safety Kit that comes with your iBook is not compatible with the current version of Sherlock. Using Sherlock with EdView may cause a system freeze that will require you to force restart your iBook. To force your iBook to restart, simultaneously hold down the Control and Command keys and then press the power button.

Hardware compatibility issues

Connecting USB devices while the computer is asleep
If you connect a USB device while your computer is in sleep, your computer automatically wakes.

Mounting and disconnecting USB storage devices
To mount or remount a USB storage volume on the desktop, disconnect and then reconnect the device that contains the volume to a USB port on the computer, or to a USB hub attached to your computer. The volume should appear on the desktop in a few seconds. If the device uses removable media, the volume will not appear until the removable media is reinserted into the USB storage device.

Before you disconnect a USB storage device from your computer, close all open windows and quit all running applications that are stored on the USB storage device. If the device has a manual eject drive (you eject the removable media from the device yourself), make sure you eject the removable media first. Drag the device's icon to the Trash on the Desktop, then disconnect the device from your computer.

Using USB devices with software applications
Some applications don't recognize a USB device if the device is plugged in while the application is already running. To use the USB device with that application, quit the application, make sure the device is properly plugged in, then start the application again.

Using ADB dongles
Some applications require the use of an ADB (Apple Desktop Bus) dongle for security purposes to prevent software piracy. The iBook computer uses Universal Serial Bus (USB) technology. You may be able to use a USB dongle with these applications. For more information, contact the software manufacturer.

Using USB-to-serial converters
Some serial devices such as modems, printers, and digital cameras may be able to be used with your iBook using a third party USB-to-serial converter adapter. However, all serial devices may not be compatible with such an adapter. For more information, contact the adapter manufacturer.

Documentation changes

References to Monitors & Sound Control Panel in Mac Help
There are several references to the Monitors & Sound control panel in Mac Help. In the current version of Mac OS installed on your computer, the Monitors & Sound control panel has been divided into two separate control panels-a Monitors control panel and a Sound control panel.

Mac Help instructions for modifying a remote access configuration
In the Editing Remote Access settings topic of Mac Help, if you click "Help me modify a remote access configuration," the information incorrectly states,"If you don't care which protocol is used or don't know which protocols are supported by the server you are calling, choose Automatic." There is no Automatic setting in Remote Access 3.4; you must select PPP or ARAP.

PowerBook G3 Series (Bronze keyboard): No Upgrade for DVD Capability

You may have a PowerBook G3 Series (Bronze keyboard) which does not have the DVD decoder installed. The PC card DVD decoder from the previous PowerBook G3 Series does not work on the PowerBook G3 Series (Bronze keyboard).

This article has been archived and is no longer updated by Apple.

Though the DVD video PC card fits into the PC card slot in your new PowerBook, Apple does not provide support for that particular combination. There are no plans to make the DVD drive available as an upgrade from Apple. Third party companies may provide this capability but Apple is unaware of any at this time.

Published Date: Feb 20, 2012

PowerBook: Information About ROM-in-RAM

The PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire), and PowerBook G4 use ROM-in-RAM (NewWorld ROM). This article provides a technical explanation of ROM-in-RAM.

This article has been archived and is no longer updated by Apple.
These PowerBooks are different from previous PowerBook computers in that they have no single, large physical ROM that contains many components of the Mac OS, the 68K emulator, hardware initialization, and the nanokernel. Instead, a small physical ROM provides hardware initialization functions and provides a mechanism to load the Mac OS ROM image into RAM. The new software architecture that is centered around ROM-in-RAM and its ramifications has the code name "NewWorld".

ROM-in-RAM

Hardware-specific code resides in firmware (ROM) that fits into one ROM called the boot ROM. The boot ROM includes the code and tables needed to start up the computer, load an operating system, and provide common hardware access services.

All higher-level software resides in what has been historically known as the Mac OS ROM, but with much of the old hardware-specific code moved into the boot ROM. As before, the Mac OS ROM can still be augmented by enablers, the System file, and extensions.

Prior to the iMac, all Macintosh computers required a ROM component that contained many components of the Mac OS software. The ROM-in-RAM approach sidesteps this requirement by copying an image of the Mac OS ROM into RAM before the Mac OS begins operation. Once Mac OS begins operation, a Mac OS ROM image in RAM and an actual Mac OS ROM behave in the same way. No new or different software interfaces are directly accessible from the Mac OS. During the boot process, software contained in the Mac OS ROM file communicates with Open Firmware to collect information about the hardware, using the Open Firmware Client Interface.

Performance

Performance of a PowerBook computer using ROM-in-RAM should exceed performance measurements for other Macintosh computers with comparable microprocessors and speeds due to the improved interrupt handling with the ROM-in-RAM approach. In addition, performance is improved because code that used to exist in ROM is now in RAM and RAM chips operate faster than the ROM chips.

RAM Footprint

Because the Mac OS ROM image is stored in RAM, approximately 3 megabytes of RAM is removed from availability for other uses. In effect, a system with 64 megabytes of RAM appears to have only 61 megabytes available. Some portion of the missing 3 megabytes is offset by having fewer patches in RAM.

Data Structures and Files

The Mac OS ROM image is contained in a new file, named "Mac OS ROM", that is kept in the System Folder. The Mac OS ROM image is exactly the same as it would be if it were an actual Mac OS ROM, containing the high-level software, the kernel software, and the 68K emulator.

Startup Disk Control Panel

Previous systems stored the user's selected startup device in PRAM when the user selected a device in the Startup Disk control panel. This device was honored by the Mac OS ROM unless the selected device was unavailable or was overridden by the user. The startup disk routine for the ROM-in-RAM PowerBook computers, rather than setting Mac OS PRAM, sets an Open Firmware configuration variable called boot-device. This setting is honored by Open Firmware unless the selected device is unavailable or is overridden by the user.

Pressing the following keys during the startup sequence can be used to override the selected startup device.

- **Command-Option-Shift-Delete**: Ignore the device that is selected in the Startup Disk control panel.
- **C**: Force the internal CD-ROM drive to be the startup device.
- **D**: Force the internal hard disk to be the startup device.

Open Firmware and Startup Devices

In order for a device supported by an expansion card (for example a SCSI PC card) to participate in the startup process (for example, to start up from a drive connected to that SCSI PC card), the card must include an expansion ROM containing startup firmware. Expansion cards for startup devices must contain all the driver code required during startup in the expansion ROM on the card. Depending on their functions, such cards may also need to provide support resources such as fonts.

Examples of devices needed during system startup include display, keyboard, and mouse devices, and storage devices such as hard drives and CD-ROM drives.

Important: If Open Firmware code is not included in the expansion card for a startup device, the card will not be usable until the operating system loads its supporting software from disk after the startup process has concluded.

PowerBook (Bronze keyboard and FireWire): Supported Resolutions for External Displays

This article documents the supported resolutions available for an external display connected to the PowerBook G3 Series (Bronze keyboard) and PowerBook (FireWire).
This article has been archived and is no longer updated by Apple.
The PowerBook has a video out port that allows you to directly connect a monitor with a VGA-style adapter, or other external video device such as a video projector. If you have an older Macintosh-compatible monitor, you can connect it using the VGA-to-Macintosh video adapter that came with your computer.

When an external monitor is connected, you can either have the same image appear on both the internal display and the external monitor (known as video mirroring) or use the external monitor to extend the size of the Mac OS desktop (known as dual display mode).

The supported resolutions for external displays are as follows:

Resolutions	Refresh Rate (Hertz)	Max. Number of colors
512 x 384	60 Hz	Millions (24 bit)
640 x 480	60/67/72/75/85 Hz	Millions (24 bit)
640 x 870	75 Hz	Millions (24 bit)
800 x 600	56/60/72/75/85 Hz	Millions (24 bit)
832 x 624	75 Hz	Millions (24 bit)
1024 x 768	60/67/72/75/85 Hz	Millions (24 bit)
1152 x 870	75 Hz	Millions (24 bit)
1280 x 960	75 Hz	Millions + (24 bit)
1280 x 1024	75 Hz	Millions + (24 bit)

+ Millions of colors are only available on the external monitor when the PowerBook display is closed, dedicating all 8MB of video memory for the external display.

Playback of DVD movies on a television connected to the PowerBook (FireWire) reduces the amount of video memory available for the built-in display. You may have fewer colors available at higher resolutions.

TV out supported resolutions
The TV out port (also known as an S-Video out port) on your computer lets you connect to a television, videocassette recorder (VCR), or video projection system.

Figure 1, TV out (S-Video out) port

You can use TV out to display images on a television or record computer images on a VCR. If your computer came with a DVD-ROM drive, you can use it to play DVD discs on your television.

When an external video device is connected to the TV out port, you can either have the same image appear on both the internal display and the device ("video mirroring") or you can use the device to extend the size of the Mac OS desktop ("dual display mode").

Because of the display limitations of most televisions, images displayed on the television screen are of lower quality than those on the built-in display or an external monitor.

How you connect video equipment to your computer depends on the type of equipment you want to connect. The S-video port can output the following display formats:

S-video: High-quality video format used by certain televisions, VCRs, and video projectors

Figure 2, S-Video cable

You can connect a cable from a S-video device directly to the S-video output port on the computer. S-video is recommended because it provides

better quality than standard composite video cables.

Composite video: Video format used by most televisions and VCRs

Figure 3, Composite video cable

To connect a composite video device, you need to use a composite video cable (not included with the PowerBook) and the composite to S-video adapter that came with your PowerBook. (Shown below)

Figure 4, Composite to S-Video adapter cable

Use the TV Mirroring portion of the Control Strip to turn video mirroring on and adjust the settings for how the images are displayed on the television.

TV Mirroring

Figure 5, TV Mirroring portion of the Control Strip

Format	Resolution	Refresh rate
NTSC	512 x 384	60 hertz (Hz)
	640 x 480	60 Hz
	720 x 480	60 Hz
	800 x 600	60 Hz
	832 x 624	60 Hz
	1024 x 768	60 Hz
PAL	512 x 384	50 hertz (Hz)
	640 x 480	50 Hz
	720 x 480	50 Hz
	800 x 600	50 Hz
	832 x 624	50 Hz
	1024 x 768	50 Hz

Notes:

1) NTSC is the television video standard for North America.

2) PAL is the television standard for most of Europe and some Asian countries.

Published Date: Feb 20, 2012

Extended Startup Time After Memory Upgrade

After installing an additional 128 MB of memory in my computer, the computer seems to takes a longer time to startup after shutdown. Is there some correlation between the amount of memory installed and a slower startup time?

This article has been archived and is no longer updated by Apple.
Yes, the memory test is part of the startup routine for computers introduced after mid-1999 such as the Power Mac G4, PowerBook G3 Series (FireWire), PowerBook G4, and iBook. Having more memory installed will extend the amount of time it takes the computer to boot.

Disabling the startup memory test may help reduce long boot times if you have a higher memory configuration.

Note: This option is normally hidden until you press and hold the Command and Option keys while opening the Memory control panel. The startup memory tests are designed to ensure that the memory is fully functional in the computer. You should disable the startup memory tests only if you are experiencing a long delay in starting up your computer.

Additionally, ensure that you have highlighted a startup disk in the Startup Disk control panel. Not having a disk highlighted can extend the startup time.

For additional information on reducing startup time, see article 31175: "**Macintosh: Reducing Startup Time**"

PowerBook G3 Series (Bronze keyboard): Additional USB Device Drivers Provided?

My PowerBook G3 Series (Bronze keyboard) CD has a CD Extras Folder that contains a USB Device Drivers folder. What are the contents for and do I need to install them?
This article has been archived and is no longer updated by Apple.
To use a USB device with a Mac OS-based computer, the device needs a driver. Apple has drivers for some devices such as mice, keyboards, and hubs, already installed in the Mac OS. Third party devices also need a driver, some of which are in the USB Device Drivers folder.

For your convenience, Apple has provided some additional drivers in the CD Extras folder, including those for the UMAX 1220U scanner (UMAX VistaScan software), HP 600 Series DJ Printers and many Epson printers (Stylus COLOR 440, Stylus COLOR 600, Stylus COLOR 640, Stylus COLOR 740, and the Stylus Photo EX).

To install these drivers, double-click the appropriate folder to open it, then launch the Installer and follow the onscreen directions. After you install the driver software, you should be able to use the device. Driver software for other devices is available from the manufacturer of the device.

Important: If you have questions about these drivers, please contact the manufacturer of the device.

For the latest drivers or information about these devices, refer to the following web sites:

Printers

PowerBook G3 Series (Bronze keyboard): Restoring PowerBook Software Read Me

This article comprises the Restoring PowerBook Software Read Me from the PowerBook G3 Series (Bronze keyboard) CD.
This article has been archived and is no longer updated by Apple.

Restoring PowerBook Software on Your Hard Disk

If any of the applications or extra files on the hard disk is damaged or erased inadvertently, you can replace them by restoring the complete set of software from the PowerBook G3 Series CD. You use the Apple Software Restore program to restore the complete set of software on your hard disk.

Follow these steps to restore the complete set of PowerBook software on the hard disk.

IMPORTANT Be sure to use the power adapter when restoring software from the CD. This process takes some time, and it may not work correctly on battery power if the battery is low.

1. Insert a CD-ROM or DVD-ROM module into the right expansion bay.

2. Insert the PowerBook G3 Series CD.

3. Select restart from the Special menu to restart the computer. Hold down the C key until the welcome message appears. (This key allows the computer to start up from the CD.)

4. Double-click to open the Apple Software Restore icon.

5. Read the program's greeting and click OK.

6. Use the Switch Disk button to select the correct destination disk, if necessary.

7. Click Restore to begin restoring the original set of software on the hard disk. A message reports the progress of restoring software.

   The default setting allows you to restore a complete set of factory preloaded software onto your hard drive. Items already on the drive will be placed in a folder called "Original Items".

   If you select Restore in Place, overlapping files on your hard drive will be replaced by the corresponding files in the image.

   If you wish to erase all the data on the drive and reformat it, select the Erase before restoring checkbox. This is the recommended procedure for restoring your hard drive to it's original state. Make sure you back up the drive if there are files you need to save. In the adjacent popup menu, you can select which type of format you would like for the drive: Same as selected configuration, which will maintain the type of format your PowerBook shipped with, Standard or Extended Mac OS format. For more details on which type of formatting is best for your needs, please see the About Mac OS Extended Format Read Me contained on this CD.

8. Click Quit when the process is complete.

If you added items to the original System Folder on the hard disk, you can transfer those items from the original System Folder (inside the Original Items folder) to the new System Folder. For more information about this procedure, see the preventing and solving problems section of Mac OS Help available from the Help menu.

TIL article 58352: "**PowerBook G3 Series (Bronze keyboard): About Important Extra System Software Folder**" contains info on some system software additions which may need to be copied to your system folder after doing an install.

Published Date: Feb 20, 2012

PowerBook G3 Series (Bronze Keyboard): Read Me

This article comprises the PowerBook G3 Series (Bronze keyboard) Read Me.
This article has been archived and is no longer updated by Apple.

Important Information About Your Macintosh PowerBook

This document provides late-breaking news about your Macintosh PowerBook G3 Series computer. You may want to print this document to keep with the user's manual for your PowerBook.

Important Information About Your Hard Disk's Format

Using Hard Disk Utilities and Disk Locking Programs Some disk utility and disk locking programs are incompatible with Mac OS Extended format. Before you attempt to use a disk utility or disk locking program, make sure the version you have is compatible with Mac OS Extended format. Check the documentation that came with the program or contact the manufacturer or the vendor that supplied the program.

Important Information About Reinstalling System Software

Your computer came with all necessary system software already installed. However, if you use the Mac OS Install program to reinstall your system software you will need to install certain items from the CD separately. These items are located in a folder titled "Important Extra System Software"

To install the extra system software:

1. After reinstalling the Mac OS, drag and drop the items from the folder on top of a closed system folder on your hard disk.
2. Click OK when asked to put the items in their proper location.
3. Restart your computer.

Important Information About Your Battery

Your battery has external indicator LEDs that let you monitor the charge level of your battery. Before the LEDs will report levels correctly, the battery must be fully discharged and recharged to calibrate the battery. After this calibration, the LEDs will report charge levels properly.

Important Information About Computer Sleep

When Using IrDA When the IrDA method of infrared (IR) communication is selected in the AppleTalk control panel and AppleTalk is on, the computer will not go to sleep automatically.

When Using a Communications Program

Many communications programs, such as PPP, Apple Remote Access, or other dial-up programs, monitor the computer's modem port to check for incoming transmissions. This may mean that the PowerBook will not sleep automatically (after the interval set in the Energy Saver control panel). Forcing sleep while connected may result in a lost connection or crash. When your computer is using the battery, you may want to quit a communications program whenever you are not using it to conserve the battery's charge. (See the manual that came with your communications program for more information.)

When Using Fax Software

Your computer will not completely sleep and the screen will only dim (instead of turn off) when fax software is set to auto answer. To avoid draining your computer battery, plug in the power adapter when waiting to receive a fax.

When FAXstf is set to answer a fax automatically, your computer will not sleep automatically. To enable the Auto sleep function in FAXstf, select Settings from the Edit menu, choose the "Fax Modem" icon, and select Never from the pop-up menu.

Waking From Sleep and the CD-ROM or DVD-ROM Drive

There is a period of time when waking from sleep that the CR-ROM or DVD-ROM drive will allow you to manually eject a mounted disc using the button on the drive tray. This will cause unexpected behavior. Closing the tray will correct the situation.

Important Information About SCSI Disk Mode

SCSI Disk Mode

The software needed to SCSI Disk Mode, is now included in the Mac OS ROM file located in the System folder. Your PowerBook cannot operate in SCSI disk mode if the System Folder is damaged or missing. Repair your System Folder by starting up from the PowerBook CD that came with your computer and reinstalling system software.

PowerBook SCSI Setup control panel

The PowerBook SCSI Disk Mode control panel has been renamed PowerBook SCSI Setup because it includes a new feature that allows the ability to wake from sleep faster.

Setting the SCSI ID

When you use your PowerBook in SCSI Disk Mode, the SCSI ID of the PowerBook will be set to #2, regardless of the ID you set in the PowerBook SCSI Setup control panel. When setting up your PowerBook for SCSI Disk mode, make sure that no other devices use SCSI ID #2.

SCSI Disk Mode and Battery Power

Always connect the power adapter when operating in SCSI Disk mode. Low battery conditions are not reported and data loss could occur if the battery gets completely drained.

Important Information About Networking

Connecting to a 10/100Base-T network

When you connect your PowerBook to an Ethernet network, the computer automatically senses whether it is connected to a 10Base-T network or to a 100Base-T network. Some (possibly all) ports on some network hubs/switches support both speeds. If you're using this type of hub/switch, there may be a delay in establishing a network link. The delay may last for several seconds after you start or restart the PowerBook and a message may appear saying the network is not available or that the network has only just become available. If you don't want a delay, connect your computer to an Ethernet network port that is not auto-sensing (10 or 100 megabits per second (Mbps) only). For more information, contact the manufacturer of the Ethernet hub/switch or your network administrator.

Performance Problems Using Ethernet

If you experience performance problems on your Ethernet network, check with your network administrator. Your computer performs best when the Ethernet port that it is connected to is set to auto-negotiate.

Important: The duplex mode of an Ethernet link to a hub is not detected if the hub's port is not auto-negotiating. If the hub's port is not auto-negotiating, your computer will detect the appropriate speed but default to half-duplex. If the hub's port at the other end of the link is configured for full-duplex, a large number of late events can occur on the link. Set the hub's port to auto-negotiate where possible. If this isn't possible, then set the hub's port to half-duplex. For more information, see the documentation that came with the Ethernet hub.

Important Information About Displays

When connecting an Apple Studio Display monitor with a USB cable to your PowerBook, be sure to connect the monitor's USB cable to the USB port (on the back panel of the computer). The AppleVision software requires this connection.

If you have an older AppleVision or Apple Studio Display monitor that has an ADB type cable you will be unable to attach the ADB cable to your PowerBook. In order to adjust the screen image you will need to use the external controls on the monitor. For more information see the documentation that came with your monitor.

When using an Apple 15" MultiScan, Apple 1705 MultiScan or an AppleVision 1710AV monitor, the PowerBook display should be set to turn off rather than dim. If the computer is set to dim, the external display may behave erratically. To set the display:

1. Open the Energy Saver control panel
2. Click on "Advanced Settings"
3. Check "Turn off the PowerBook display instead of dimming it."

Important Information About Operating With the Display Closed

When operating with the display closed and an external monitor attached, you must have the PowerBook connected to the power adapter. Display closed operation while running on battery power is not supported.

Important Information About Your Expansion Bays

Booting from Expansion Bay devices If the system folder on your internal hard drive is invalid and you need to boot from an expansion bay module, be sure the module is inserted prior to booting or restarting your computer. If you insert the module after booting, you will see a blinking question mark or blinking folder icon. This is not recommended as unexpected results may occur.

Important Information About the Internal Modem

The modem used in the PowerBook G3 Series is a 56K modem based on the new V.90 specification. Any time a new modem standard is introduced there is a period of adjustment while various Internet service providers (ISPs) work to ensure that their POP (Point-of-Presence) servers are compatible with the new specification.

If you're having problems connecting in V.90 mode--if the modem won't connect at all, or the connection is dropped after a few minutes--it may be because the phone lines are too noisy or there's too much interference to sustain a connection of speeds above 33.6 kilobits/second (Kbps). Contact your ISP to ensure they are currently using V.90-compliant modems, or have plans to update to them in the near future. Use the PowerBook G3 Series Internal 56K (V.34 Only) modem script, which forces the modem to connect at 33.6 Kbps or lower speeds. This type of connection is more reliable in situations where the phone line quality is questionable.

To use the PowerBook G3 Series Internal 56K (V.34 Only) option, follow these steps:

1. Open the Modem control panel in the Apple menu.
2. Make sure the "Connect via" pop-up menu is set to Internal Modem.
3. Open the Modem pop-up menu and choose "PowerBook G3 Int56K (v.34 Only)".
4. If necessary, set the Sound and Dialing options.
5. Close the control panel. A message asks if you want to save the changes to the current configuration.
6. Click Save. **Note**: You do not have to restart your computer in order to use the new modem software.

Important Information About Startup Disk Devices

Be sure a valid startup disk is selected in the Startup Disk control panel. If an invalid startup disk is selected, your computer could take as long as 2 minutes to locate a volume that it can startup from. PC Card devices and RAM disks are examples of devices that are not valid to start up from, even though the icon may be displayed in the Startup Disk control panel.

Selecting the Network Disk icon in the Startup control panel without having a Netboot server properly setup will also significantly delay the time it takes you PowerBook to boot up.

Your computer cannot startup using an external USB device.

Important Information About Using A Television With Your PowerBook

The online Help incorrectly states that you can turn TV Mirroring on and off from the control strip. TV Mirroring should turn on automatically after you wake or start up the computer. To turn it off, sleep the PowerBook and then disconnect the video cable from the back panel of the computer.

Important Information About Viewing DVD Video

For best performance when viewing a DVD video:

- Turn off virtual memory in the Memory control panel.
- Turn off file sharing in the File Sharing control panel.
- Make sure that the disk cache is to the default setting in the Memory control panel.
- Quit all other applications.

Important Information About Third-Party Hardware

About drivers for USB input devices To run a USB device on a Mac OS-based computer, the device needs a software program called a "driver," available from the manufacturer of the device. Drivers appear as extension files stored in the Extensions folder within the System Folder. Apple already includes drivers in the Mac OS for USB mice, keyboards, hubs, game devices, and Iomega's USB Zip drive. Drivers for other devices, such as Epson and Hewlett-Packard printers, are included on the software install CD that came with your computer. These drivers can be found in the CD Extras folder, within the USB Device Drivers folder. After you install the driver software, you should be able to use the device. If you have problems, please contact the manufacturer of the device. From time to time, new versions of USB drivers become available. For up-to-date information on driver software, contact the manufacturer of the device.

Check the documentation that came with the device for installation instructions or contact the manufacturer or the vendor that supplied the device.

Some USB devices may not work with Mac OS until Mac OS drivers are made available. For information about the compatibility of a USB device with Mac OS, contact the manufacturer of the device.

Some applications don't recognize USB devices if the devices are plugged in while the application is running. To use the USB device with that application, quit the application, make sure the device is properly plugged in, then start the application again.

Using ADB Dongles

Some applications require the use of an ADB (Apple Desktop Bus) dongle for security purposes to prevent software piracy. The PowerBook now uses Universal Serial Bus (USB) technology. You may be able to use a USB dongle with these applications. For more information, contact the software manufacturer.

Using USB-to-Serial Converters

Some serial devices such as modems, printers and digital cameras may be able to be used with your PowerBook using a third-party USB-to-Serial converter adapter. However, all serial devices will not necessarily be compatible with such an adapter. For more information, contact the adapter manufacturer.

Using files on USB Storage devices

When working with files on an external USB storage device, always quit any open applications that may be using a file on the device before you sleep your PowerBook or disconnect the device. Unexpected results may occur, including the possibility of corruption of the media within the USB device. Contact the vendor of the specific USB device for more information.

Important Information About Installing Help For Your Computer

Your computer came with additional Help files specific for your model of computer. These files are already installed on your hard disk and available in the Help Center. This installation program will reinstall the Help files specific for your model of computer.

Reinstallation of these Help files is only necessary if you performed a clean installation of this or future versions of the Mac OS system software and your computer specific Help files are missing from the Help Center. The installation program for these computer specific Help files is located in the CD Extras folder on your PowerBook G3 Series CD.

Important Information About PC Cards

Your computer has a manual PC Card eject mechanism. To eject a PC Card, drag the card's icon to the trash and then use the PC Card eject button to eject the card. This is different from previous PowerBooks where dragging the icon to the trash would cause the card to be ejected from the slot.

Important Information About a RAM disk

The RAM disk cannot be used as a startup disk. If you create a RAM disk, its icon will not be displayed in the Startup Disk control panel.

The contents of a RAM disk are saved to the startup drive when you restart your computer. The contents are restored, once the computer restarts. Large RAM disks may add additional time to shutting down and restarting the computer.

Warning: The contents of the RAM disk can be lost if:

- the startup drive is read-only, such as a CD-ROM disc
- the startup drive does not have sufficient space to store the contents of the RAM disk
- the startup drive does not have a valid System Folder
- the computer loses power

Published Date: Feb 20, 2012

PowerBook G3 Series (Bronze keyboard): Description

This article comprises the description of the PowerBook G3 Series (Bronze keyboard) introduced in May, 1999.
This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook G3 Series computers-the world's fastest notebook computers- are now almost 20 percent thinner and nearly 2 pounds lighter than their predecessors. With processor speeds up to 400 megahertz, they run up to twice as fast as comparable Pentium and Pentium II processor-based notebook and desktop systems.* And with as much as 10 gigabytes of hard disk capacity, plus a CD-ROM or DVD-ROM drive, they'll meet all your storage needs.

With these powerful capabilities and a high-resolution 14.1-inch (diagonal) color display, the Macintosh PowerBook G3 makes a versatile desktop computer as well as the ideal mobile solution, whether you work in creative design, business, or education. And with the dual-battery capability, you can keep working for longer than ever-up to 5 hours at a time with one battery or up to 10 hours with two batteries (depending on configuration and usage).

The new PowerBook G3 supports the latest technologies for connecting high-speed peripherals. Two Universal Serial Bus (USB) ports are already built in, and you can add an optional third-party FireWire CardBus card for connecting to peripherals such as digital video cameras and hard disk drives.

Ethernet connectivity is vital in business and education environments, so PowerBook G3 systems support both 10BASE-T and the high-speed 100BASE-T Ethernet protocols. And you can stay in touch wherever you are with the internal 56K modem that lets you tap in to your organizational network or the Internet.**

Built-in VGA and S-video output ports offer you flexible display options. Now, with built-in dual-display capability, you can add an external monitor and expand your on-screen workspace. For great presentations, simply connect a TV or projection device.

Want to enjoy movies while you're traveling? You can get your PowerBook G3 system with a built-in DVD-ROM drive that plays DVD movies and also lets you use your favorite CD-ROMs. Or choose the 24x-speed CD-ROM drive for fast, smooth playback of multimedia reference discs, educational titles, and games. The hot-swappable expansion bay also accepts third-party Zip, SuperDisk, and hard disk drives.

The Macintosh PowerBook G3 Series: desktop performance in a notebook computer.

Features

Outstanding performance

PowerPC G3 processors for the fastest performance of any notebook computer*

Performance-boosting backside level 2 cache

Support for up to 384MB of SDRAM

Up to 10 hours of battery life through dual lithium-ion battery capability

Latest I/O technology, including two USB ports for connecting a variety of peripherals

Stunning style

Thinner and lighter than ever-PowerBook G3 Series models start at just 5.9 pounds

Hot-swappable expansion bay that accepts CD-ROM or DVD-ROM drives and third-party peripherals such as Zip, SuperDisk, and hard disk drives

Handy weight-saving module that slips into the expansion bay in place of the CD-ROM or DVD-ROM drive or battery to reduce travel weight

Easy access to memory expansion and the removable hard disk drive through the flip-up keyboard

Advanced multimedia

14.1-inch (diagonal) active-matrix display for crisp text and brilliant color

8MB of video memory for displaying millions of colors on both the built-in screen and an external monitor

Support for dual displays and video mirroring with the integrated ATI RAGE LT Pro video controller

VGA and S-video output ports for easy connection to an external monitor, video projector, or TV

Integrated communications

Built-in 56K modem with V.90 support

10/100BASE-T Ethernet for easy access to high-speed networks

4-Mbps IrDA technology for quick wireless LAN access and file sharing

Available Configurations

Order no.	**M7304xx/A**	**M7308xx/A**	**Note:** In the US all model numbers are LL, thus the order number for the 400 MHz PowerBook would be M7308LL/A
Macintosh PowerBook G3 Display	14.1-inch TFT	14.1-inch TFT	
Processor speed	333 MHz	400 MHz	
Backside level 2 cache	512K	1MB	
Backside bus speed	133 MHz	160 MHz	
Memory (SDRAM)	64MB	64MB	
Video memory (SDRAM)	8MB	8MB	
Video controller	ATI RAGE LT Pro	ATI RAGE LT Pro	
Hard disk drive	4GB IDE drive	6GB IDE drive	
CD-ROM drive	Yes	-	
DVD-ROM drive with DVD-Video playback	-	Yes	
Ethernet	Built-in 10/100BASE-T	Built-in 10/100BASE-T	
56K modem (supports V.90)	Yes	Yes	
S-video output	Yes	Yes	

All models also include a built-in keyboard and trackpad; modem cable; power adapter; S-video to composite adapter; VGA-to-Macintosh adapter; Mac OS 8.6; Apple File Synchronization; Apple Location Manager; third-party software (Microsoft Internet Explorer, Microsoft Outlook Express, Netscape Communicator, and FAXstf); complete setup, learning, and reference documentation; and limited warranty.

Build-to-order (BTO) options

In addition to choosing from Apple's prebuilt systems, you can order a custom-configured PowerBook computer from your local reseller or the online Apple Store. This allows you to select the processor speed, amount of RAM, hard disk capacity, and a CD-ROM or DVD-ROM drive. You can also order an additional lithium-ion battery and third-party peripherals such as Zip and SuperDisk drive expansion modules or a FireWire CardBus card. For up-to-date information about options and availability, visit **www.apple.com/store**.

Color StyleWriter: Troubleshooting Light Print or No Print Condition

This article describes a situation where a Color StyleWriter goes through the motions of printing, but no ink is deposited on the paper. In other cases, the print is light. Replacing the ink tanks did not help.
This article has been archived and is no longer updated by Apple.
Print quality symptoms with ink jet printers are almost always caused by ink cartridge or ink tank issues. First we need to make sure we are using the same terminology in describing these parts. The standard color cartridge assembly (this would include all the Color StyleWriters except the 4000 and 6000 series) comes with three parts:

- The cartridge itself which has the print head in it
- The black ink tank
- The three color (Cyan, Magenta, and Yellow) ink tank.

The two ink tanks snap into the cartridge to complete the assembly, and the cartridge assembly snaps into the carriage of the printer.

As would be assumed, an empty ink tank can cause the printer to print light or completely blank. However, this can also be caused by the cartridge if the print head had become clogged with dry ink. This can usually be cleared by using the utility in the printer driver to clean the print head. This is accomplished from the Print dialog box by selecting the 'Utility' button and check the 'Clean ink cartridge before printing' option. This may need to be done five or six times to clear a severely clogged print head.

If cleaning the print head does not resolve the problem, it is possible that the print head is bad and needs to be replaced. The print head cartridge is designed to be used through several changes of ink tanks, however as print quality degrades, the cartridge should also be replaced.

One of the worst things you can do to an ink jet printer is to allow it to go for extended periods of time without use. Without regular use, the small holes that make up the print head become clogged with dried ink. This is one of the major causes the symptoms we are discussing here.

Note: It is possible for the ink tanks and cartridge to be good and have the printer go through the motions of printing and put no ink on the page due to a failure in the printer. However, this is very rare and should only be considered after troubleshooting the cartridge/ink tank as described above.

PowerBook G3 Series: Intermittent No Video on Wake From Sleep

Sometimes when waking a PowerBook from sleep the screen stays black.

This article has been archived and is no longer updated by Apple.
We have found that if the built-in display is set to a non-native resolution (something other than 1024 x 768 on a 14-inch display or something other than 800 x 600 on a 12-inch display), the PowerBook may do this in certain circumstances. The light stops blinking, the hard disk spins up, and the processor is functioning, but the screen remains black.

If you run into this situation, simply force the PowerBook back to sleep by pressing command-shift-0 (or closing the lid) and then wake it up again. It might also be a good idea to leave the PowerBook display set to its native resolution (1024 x 768 for 14-inch displays and 800 x 600 for 12-inch displays).

Note: This issue affects only the PowerBook G3 Series model number M4753 that was released in September of 1998.

Personal File Sharing: Volume Size Reporting Limitations

Personal File Sharing in Mac OS 8.x can share volumes up to 2 terabytes in size. However, some size values may not be reported correctly on client machines.

This article has been archived and is no longer updated by Apple.

When you mount a Personal File Sharing volume having greater than 1.9GB of available space, only 1.9 GB of the available space is reported. When the available space is less than 1.9 GB, the size is reported correctly.

Example: If you mount a 6 GB volume with 2 GB of space used, you will see 1.9 GB free when viewing the volume from the remote machine. If you copy 500 MB of data to the remote volume, you will still see 1.9GB available. If you then attempt to copy 2.0 GB of data to the remote volume, you receive an erroneous message that there is not enough space on the remote volume. To work around this, copy the data in chunks of less than 1.9 GB. When you are finished, you will see (correctly) that there is only 1.5 GB of space available on the remote volume.

In addition, when you mount a volume larger than 2 GB, or a volume of any size that is formatted as Mac OS Extended, which is shared via Personal File Sharing, individual file sizes may appear incorrectly on your client machine.

These limitations are cosmetic only, and do not affect the integrity of the shared data. These limitations do not exist in the current version of AppleShare IP. For more information on AppleShare IP, please see http://www.apple.com/support and search AppleShare IP.

Open Transport: DHCP Client Behavior

Different versions of Open Transport behave differently when discovering, renewing, and releasing a DHCP lease. This article describes the behavior of the DHCP client in different versions of Open Transport.
This article has been archived and is no longer updated by Apple.
In response to customer feedback, Apple has changed the DHCP client implementation in Mac OS 8.5, and again in Mac OS 8.6. A given DHCP client may behave in unexpected ways with certain DHCP servers. This document aids in troubleshooting DHCP issues by providing a reference for the expected behavior of each version of Open Transport and the Mac OS.

For a complete description of the terms used below, and for a description of the DHCP protocol, see RFC 2131.

Mac OS 8.1 and earlier (Open Transport 1.3.1 and earlier)

IP Load

Every time the IP stack loads, the DHCP client sends out a DHCPDISCOVER packet. If the Macintosh receives no response to this, IP does not load and any application trying to use IP services returns an error.

Loading IP in this manner does not attempt to keep the same IP address when a computer is restarted. Depending on the DHCP server configuration, the client may receive a different IP address every time the IP stack loads.

IP Unload

When the IP stack unloads, the DHCP client sends a DHCPRELEASE.

Mac OS 8.5.x (OpenTransport 2.0.1 & 2.0.2)

IP Load

The DHCP client was modified in Mac OS 8.5 so that the client would attempt to regain the previously assigned IP address if the lease is still active when the IP stack loads. This makes it much more likely that a computer retains the same IP address when it is restarted.

The IP stack can load in two different states in Mac OS 8.5:

INIT

A client starts up in the INIT phase when:

(a) the previous lease has expired when the client starts up.

(b) there is no previous lease information (this is the first start up with DHCP, or the previous attempt to load IP timed out).

In the INIT state, the Macintosh sends out a DHCPDISCOVER, requesting a lease from any DHCP server on the network. If the Macintosh client receives no response to the DHCPDISCOVER after about a 16-to 20-second wait, DHCP generates a randomly chosen IP address in the range 169.254.0.0 to 169.254.254.255 inclusive and a subnet mask of 255.255.0.0.

INIT-REBOOT

If the client's last assigned DHCP lease has not expired, then the client starts up in the INIT-REBOOT state in an attempt to regain the most recently used IP address. The Macintosh broadcasts a DHCPREQUEST asking to use its last IP address.

The server should respond to a DHCPREQUEST in one of two ways:

1. Server sends the client DHCPACK, which tells the client that it may use the requested IP address. In this case the client proceeds with a new lease on the same IP address.

2. Server sends the client DHCPNACK, which tells the client that it may not use the requested IP address. The client then moves to the INIT state and sends out DHCPDISCOVER as noted above.

If the Macintosh begins in the INIT-REBOOT state and receives no response to its DHCPREQUEST, this attempt to load the IP stack fails and the client has no IP services. The state of the client is changed so the next stack load starts in the INIT state described above.

IP Unload

When the IP stack unloads, the DCHP client sends out a DHCPRELEASE. This lets the server know that the client no longer needs the IP address and frees the server to allocate the address to another client.

Mac OS 8.6 and later (Open Transport 2.0.3 and later)

IP Load

The DHCP client behaves similarly to Mac OS 8.5 in that IP initially loads in the INIT state, and loads in the INIT-REBOOT state (sending out a DHCPREQUEST) if its previously assigned lease has not expired. However, unlike Mac OS 8.5, if no DHCP server responds and INIT-REBOOT times out, the computer automatically reverts to the INIT state, send out a DHCPDISCOVER, and search for another DHCP server on the network.

If there is no response to the DHCPDISCOVER after a few tries, it picks a randomly generated IP address as in Mac OS 8.5.

IP Unload

When the IP stack unloads, the DHCP client no longer sends a DHCPRELEASE.

Furthermore, once a DHCP lease is obtained, the IP stack does not unload, regardless of whether or not "Load Only When Needed" is checked (this is not true for PPP links, since this wouldn't allow users to automatically hang up after a specified period of idle time). The Macintosh unloads the IP stack only if it is shut down, restarted, or inactivated in the TCP/IP control panel. In addition, the stack unloads on a PowerBook when it is put to sleep. Otherwise, it continuse to renew the DHCP lease.

Note: Open Transport 2.5.1 and 2.5.2 have an issue which can cause the client not to renew the lease properly if the renewal time is longer than 1 hour. For additional information please see article 25049: "**Mac OS: DHCP Issues With Open Transport 2.5.1 and 2.5.2**"

TCP/IP Options (Mac OS 8.6)
For administrators who prefer the 8.1 DHCP client behavior, the TCP/IP Options control panel allows users to revert to the old behavior. By checking the box for "don't retain DHCP lease on shutdown, " the Macintosh always starts up with DHCPDISCOVER, and always send a DHCPRELEASE upon unloading the IP stack.

Mac OS 8.5: Workaround to Non-functional PPP Connect AppleScript

As of Mac OS 8.5 the AppleScript command "PPP connect" no longer works. Any script which uses this command will fail to initiate a PPP connection. These scripts should be modified to use the scripting facilities provided by Network Setup Scripting 1.0, included in Mac OS 8.5 and later.
This article has been archived and is no longer updated by Apple.
Here is a sample script using "PPP connect" to initiate a PPP connection:

PPP connect

This command used to initiate a PPP connection with the active Remote Access configuration.

This same script using Network Setup Scripting would read:

```
tell application "Network Setup Scripting"

open database

tell Remote Access configuration x to connect

close database

end tell
```

"Remote Access configuration x" is an existing Remote Access configuration containing the values for user name, phone number, etc. for the connection you wish to make. This script will work for any Remote Access configuration regardless of protocol, so it can be used for either PPP or ARAP connections.

Network Assistant 4.0.x: Desktop Items not Copied

The Apple Network Assistant has a Copy Hard Drive feature that can be used to copy an entire hard disk to client computers. Files and applications on the desktop of the administration computer do not get copied to the client computers. Likewise, items on the desktop of the client computers are not replaced or deleted.

This article has been archived and is no longer updated by Apple.
This is the expected behavior. Apple Network Assistant is designed to leave any items on the desktop alone, both on the client and on the administration computer. There are a couple of situations where this functionality comes in useful:

- On the client, when there are things you want to keep safe and do not want replaced or erased when you copy the entire hard disk.
- On the server, when there are just a few of things you do not want to copy to the client systems (administration applications, for example).

If your lab computers have items on the desktop and you want all of them to start off with a clean hard disk, use Network Assistant's Delete Hard Disk feature before copying the hard disk. This erases all items on the hard disk (except for the System Folder), including anything on the desktop.

QuickTime 4: Common Issues After a Minimum Install

I ran the installer for QuickTime 4 and chose the "Minimum Install" option (it was selected by default). After installing QuickTime 4, I have noticed one or more of the following issues:

- PictureViewer was not installed
- I get an error saying "DVD Hardware not found" when I run the Apple DVD Player
- I cannot open certain file types in QuickTime Player (like QTVR files and MP3 files)
- The "preview" doesn't work in the open dialog box of some applications

This article has been archived and is no longer updated by Apple.
During the installation of QuickTime 4, you are presented with 3 different install options:

- Minimum
- Full
- Custom

By default, the Minimum option is checked. While Minimum is suitable for many customers, others will find that it does not install many QuickTime components that they rely on.

With a Minimum install, the QuickTime installer will remove the old QuickTime 3 extensions (as it should) and install the minimum QuickTime 4 components (including the QuickTime extension, QuickTime Streaming support, the QuickTime Plug-In, and the QuickTime player). PictureViewer, among other commonly used QuickTime components, does not get installed with the Minimum install option.

Because of this, certain applications that rely on those QuickTime components, such as the Apple DVD Player or applications that have the ability to show file previews in their Open dialog boxes, will not work properly. Furthermore, QuickTime Player will not be able to open certain file types without these additional components installed.

In most cases, QuickTime will display an alert that you are missing some components to provide you with comparable functionality and it should offer to download them automatically. However, this may not always occur.

If you are experiencing any of the above issues, you might need to re-run the QuickTime installer and select either the Full or Custom install option.

Apple DVD Player: Troubleshooting Common Issues

This article is about possible issues when playing a movie from a DVD-Video disc.
This article has been archived and is no longer updated by Apple.

Black Bars Surround the Picture

Black bars on the top or bottom of the screen, and perhaps on the sides of the movie, are normal. See technical document 60795 "**Apple DVD Player: Why Black Bars Surround the Picture**" for more information.

Video or Sound Stutter

Stutter is a momentary pause in playback. It can affect the video image or the sound. See technical document 31020: "**Apple DVD Player: How to Reduce Skipping or Stuttering**" for tips on how to reduce stuttering. Also try these tips:

- The DVD-Video disc could be dirty. Clean it with a soft cloth.
- The DVD drive may need to be repaired or replaced. If you have a PowerBook, try a different DVD drive if one is available. If not, take your computer to an Apple Authorized Service Provider for further troubleshooting.

Hardware Error

The Apple DVD Player application displays a message that there is a hardware error.

- If you have a PowerBook G3 Series computer, see technical document 24865: "**PowerBook G3 Series: 'Apple DVD Player Cannot Open...' Error**"
- If you have installed Mac OS 9.0.4, you may also need to install Apple DVD Player 2.2. See technical document 20125: "**Mac OS 9.0.4: Requires Apple DVD Player 2.2.**"
- Use Apple System Profiler to verify that the computer has DVD capabilities.
- Make AppleTalk inactive in the AppleTalk control panel.
- Clean the DVD-Video disc.
- Make sure the Apple DVD Player application and the Apple CD/DVD Driver software is installed correctly and is active.
- If you have installed QuickTime 4 using the Basic Install option, which is the default, open the QuickTime installer and select the "QuickTime Authoring" option instead of the Basic option.
- Take your computer to an Apple Authorized Service Provider for service.

Pixelation in Dark Scenes

- Open the Monitors and Sound or Monitors control panel, and select Millions of colors. Select an 800 by 600 resolution. If your computer is connected to an external monitor, select a 720 by 480 resolution.
- Choose normal size as opposed to full screen for the best quality image.
- Select best for video when playing the movie on an S-video device like a television.

Audio Synchronization Issues

- If the sound does not synchronize with the video on a Power Mac G4 or iMac DV, see technical document 60718: "**Apple DVD Player: How to Improve Movie Playback From DVD Discs.**"

Low Sound Volume

1. Open the Sound or Monitors and Sound control panel
2. Make sure Line In audio is not selected.

No Sound

1. Change the sound setting while playing the movie by clicking the audio button on the DVD controller.
2. Access the DVD-Video disc as an ISO 9660 disc by pressing the Command-Option-i keys simultaneously while inserting the disc.
3. If you're using external speakers, check their connection. Try different external speakers, or use the internal speaker(s).
4. On a PowerBook G3 Series (Bronze keyboard) computer, make sure Zoomed Video is selected in the Sound Strip portion of the control strip.
5. Take your computer to an Apple Authorized Service Provider for service, especially if you don't hear sound from other applications.

No Video with Sound

1. Check to see if the Viewer Window is Hidden (using the Hide/Show Viewer option from the Window menu)
2. Verify that the application is not hidden (using the option from the Application Menu)
3. Make sure you are using the primary Apple display card as the boot monitor and that the location of the menu bar is on the primary display.
4. Make sure the DVD player is being presented on the factory installed Apple display card with the primary monitor attached to this card.

Movie Stops Playing at Opening Window

- Press Return for a few seconds. If the video has not started, press the Space bar.

Some Items in the Movie's Menu Can't Be Selected With the Mouse

- Use the arrow keys to select a menu item, then press Return to choose it.

White Image in Viewer Window

- Make sure Video Mirroring is turned off when connected to a television.

Window Will Not Move From External Source to Computer Display

When an external display is connected, the window is only viewable on the external display.

1. Put your computer to sleep.
2. Disconnect the external monitor.
3. Wake up the computer.

Compatibility With Additional Features

On a limited number of DVD-Video titles there is a message in small print on the back of the box that reads, "The DVD-ROM features will not work on a CD-ROM or a Macintosh computer." The movies "You've Got Mail" and "The Matrix" and "Enemy of the State" are examples.

- Many features of the DVD-Video disc, including the ability to play the movie, are available when using the Apple DVD Player application. Only features that require additional software to be installed are not available. For the most part, those features are likely to have software written for a Windows environment. It is possible the movie was not mastered in the standard format for DVD-Video (UDF). You may have to access the disc as an ISO 9660 disc. If you insert the DVD-Video disc and it doesn't contain any files, then it was not mastered in the standard format for DVD-Video discs.
    1. Eject the DVD-Video disc.
    2. Access the disc as an ISO 9660 disc by pressing the Command-Option-i keys simultaneously while inserting the disc. It may take a few minutes for the disc to be available on the desktop. For more information on this issue, see technical document 25000: "**Apple DVD Player: "Disc May Be Dirty or Scratched" Error Message.**"

Pause Before Playing

After clicking Play in the Apple DVD Player application, the movie does not start immediately.

- It takes a moment for the movie to load. The system software is accessing necessary information to decode the movie. This behavior is completely normal and is not indicative of any hardware or software issues.

PowerBook G3 Series (Bronze keyboard): Password Security Issue with USB Keyboard

When a PowerBook G3 Series (Bronze keyboard) comes out of sleep and displays the Password Security dialog, an external keyboard may be unresponsive.

This article has been archived and is no longer updated by Apple.
When the PowerBook wakes from sleep the Password Security control panel is activating before the PowerBook has a chance to enable the USB bus. This results in any external USB keyboard not working. This happens only if Password Security is set to "ask when waking from sleep." To work around the situation, use the built-in keyboard on the PowerBook to type the password.

Published Date: Feb 20, 2012

PowerBook and iBook: What to do if trackpad button doesn‘t respond

This article has been archived and is no longer updated by Apple.

There are a number of possible causes if your trackpad button doesn't respond which could affect either a PowerBook or iBook computer.

- It is possible that the issue may be caused by a peripheral that has been attached to the computer. Disconnect any USB or ADB devices such as mice, keyboards, or joysticks and see if the issue still persists. If this resolves the issue then it could be an old version of the software that supports this accessory device, or it could be a hardware issue or incompatibility. You should refer to the vendor of the accessory for driver updates or service for the product.
- It could be a hardware issue with the trackpad button itself. If you need to use the computer until you can have it serviced, you may, depending on the iBook or PowerBook model you own, enable the Clicking feature in the Keyboard & Mouse pane of System Preferences (in Mac OS X) or the Trackpad control panel (in Mac OS 9).

When you enable the clicking feature, you are able to tap on the trackpad to duplicate the same action as clicking on the trackpad button.

Keyboard & Mouse pane of System Preferences in Mac OS X

Trackpad control panel in Mac OS 9

Note: Not all PowerBook models support the clicking feature in the Trackpad control panel. On those that do not, the "Use Trackpad for" section will not be displayed in the Trackpad control panel.

Published Date: Feb 20, 2012

Your PowerBook and iBook‘s trackpad doesn‘t respond

Your computer's trackpad isn't working? Try these helpful steps:
This article has been archived and is no longer updated by Apple.

- Try cleaning the trackpad. Use a soft cloth and gently wipe the trackpad. Also be sure your pointing finger is clean and not oily.
- The trackpad works on a principle called coupling capacitance. As your finger moves over the surface, the trackpad evaluates the change in capacitance between two layers of measurement electrodes built into the surface of the trackpad and translates that to cursor movement.

  Make sure only one part of your finger is touching the pad. You will not be able to use a pen or other object--the trackpad is designed to work only with your finger. Also make sure that you are not resting your wrist on or very close to the pad.
- If you have sweaty hands or if moisture collects on the pad, this may also confuse the trackpad. Wiping off the trackpad with a cloth or tissue will usually fix this symptom.
- Oil or lotion can also cause the same symptom. Either do not use hand lotion, or consider purchasing a Teflon pad to protect the trackpad. Before installing the Teflon pad, make sure the trackpad is clean and dry.
- Jewelry may also cause interference. Try removing rings or bracelets and see if the jumpy or erratic behavior disappears.
- Reset the Power Manager.
- Some software can make it look like the trackpad isn't working. Use the Extensions Manager control panel in Mac OS 9 and set the extensions to Mac OS All for your system. Restart the computer and see if the issue is resolved. If so, you need to troubleshooting your extensions.
- A peripheral connected to your computer could cause this symptom. Disconnect any USB or ADB devices such as mice, keyboards, or joysticks and see if the issue still persists. If this resolves the issue, it might be caused by an old version of the software that supports this peripheral, or it could be a hardware issue or incompatibility. Refer to the information that came with the peripheral to see if there may be driver updates or how to getting service for the product.
- This could be a hardware issue. If you need to use the computer until you can have it serviced, connect a mouse to one of the ports on the back of the computer. Some PowerBook models support ADB while other PowerBooks and iBooks support USB. Refer to your PowerBook User Manual if you are uncertain which mouse type you should use.

PowerBook S-video Questions and Answers

Learn about the S-video output port on the PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire), and PowerBook G4 computers. This article has been archived and is no longer updated by Apple.

Question: How does the S-video output port work on the PowerBook G3 Series (Bronze keyboard), PowerBook (FireWire), and PowerBook G4 computers?

Answer: Simply plug an S-video cable into your television's S-video input port and into the computer's S-video output port. If your television doesn't have an S-video input port, you can use its composite connection using the S-video-to-composite video cable that came with your PowerBook computer. Once both the television and computer are connected and turned on, choose the NTSC or PAL resolutions from the Monitor Resolution portion of the Control Strip. For more information about using a monitor or television with your PowerBook computer see:

Article 58344: "**PowerBook G3 Series (Bronze keyboard and FireWire): Supported Resolutions for External Displays.**"

Question: Why is the image on the television fuzzy and not as sharp as the PowerBook's display?

Answer: The images on a television are of lower quality than those on a monitor, including your PowerBook computer's display. This is because most televisions have limited image quality, and not because anything is wrong with your computer.

Question: Why does my television only show images in black and white when connected to the computer with a composite cable?

Answer: This usually means you are not using the S-video-to-composite cable that came with your PowerBook computer. You are most likely using an S-Video input cable. Use the S-video-to-composite cable that came with your PowerBook computer instead.

Question: What resolutions can be used with the S-video output port?

Answer: See the following articles:

Article 58344: "**PowerBook G3 Series (Bronze keyboard and FireWire): Supported Resolutions for External Displays.**"

Question: When I play a movie from a DVD-Video disc it always plays on the television. How can I play it on the PowerBook computer's display instead?

Answer: If a monitor or television is connected to the PowerBook computer's S-video output port when you play a movie from a DVD-Video disc, it plays on the monitor or television. Do this to play the movie on the PowerBook computer's display:

1. Quit the Apple DVD Player application program.
2. Put the PowerBook computer in sleep.
3. Disconnect the monitor or television from the PowerBook computer's S-video output port.
4. Wake up the PowerBook.
5. Open the Apple DVD Player program.
6. Restart the movie.

Question: Can I use the PowerBook's video mirroring feature with the S-video output port?

Answer: Yes. Click the Video Mirroring portion of the Control Strip to turn on video mirroring. See Image 1 and Image 2. You may also see a Television Mirroring portion in the Control Strip that can improve the quality of video and graphics when mirroring to a television using S-video. See Image 3.

Video Mirroring On

These options are available on the Control Strip when Video Mirroring is turned off and a television is connected. (**Note:** Video Mirroring has a single monitor icon when disabled.)

Video Mirroring Off

These options are available on the Control Strip when Video Mirroring is turned on and a television is connected. (**Note:** Video Mirroring has a dual monitor icon enabled.)

Television Mirroring

These options are available when a television is connected to the PowerBook computer's S-video output port.

Choose "Best for Video" and "Best for Graphics" when mirroring with S-video. Overscan extends the desktop video and may cause the menu bar to go outside of the television's viewable image area.

Note: If you have a monitor and a television connected to your PowerBook computer, you can switch between the two by selecting the correct resolution. (S-video resolutions have either NTSC or PAL listed after the actual resolution size.)

Question: When I try to play a movie on the television from the PowerBook's DVD drive, why do I only get a white screen in the Apple DVD Player window?

Answer: You cannot use Video Mirroring when you watch a movie from a DVD-Video disc. Turn off Video Mirroring and then open the Apple DVD Player.

Question: When I play a movie from a DVD-Video disc, why isn't it centered on the television?

Answer: Each television has its own display characteristics. You may be able to adjust the television from its controls to center the movie.

Question: Can I display external video on the S-video port and on another external video port (such as DVI) at the same time?

Answer: Most models of PowerBook do not support displaying external video on multiple video ports. If a PowerBook model does support this feature, it will be listed in the technical specifications for that model.

PowerBook G3 Series: Reducing Time to Awake From Sleep

Are there any methods available for reducing the amount of time it takes my PowerBook to wake from sleep?
This article has been archived and is no longer updated by Apple.
There are a couple of options which can reduce the time to wake from sleep:

- Turn off reconnect to servers in the advanced settings of energy saver.
- Making AppleTalk inactive using the Control Strip, or the Chooser.

AppleWorks: Unexpected Results When Fit to Page Option is Enabled

If Fit to Page is enabled when AppleWorks or ClarisWorks prints to some Epson printers, the printout may look different than expected.
This article has been archived and is no longer updated by Apple.
The Fit to Page option may cause unexpected results when printing to some Epson inkjet printers from some applications, including AppleWorks and ClarisWorks.

The results may include:

- Text near the margins, usually at the right or bottom, may be cut off.
- The document contents may be compressed into the top left corner of the page.

The Epson printer driver software has a function that shrinks or enlarges the printout so that an entire document will fit on a single page. By default, this option is enabled within AppleWorks and ClarisWorks. The reduced or enlarged printout is an expected result when this function is enabled.

To solve this problem and print the document at its specified size, disable the Fit to Page option in Page Setup.

Gigabit Ethernet Card: Q & A

This article contains frequently asked questions (FAQ) regarding gigabit Ethernet and the Apple gigabit Ethernet card, with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. What is gigabit Ethernet?
2. What differences are there between gigabit Ethernet and standard (10BaseT) or fast (100BaseT) Ethernet?
3. What cables are supported by the Apple gigabit Ethernet card?
4. What Macintosh operating systems are supported by the Apple gigabit Ethernet card?
5. Does the gigabit Ethernet card auto-switch between 10Mbps, 100Mbps, and 1000Mbps?
6. How do I connect a Macintosh with the gigabit Ethernet card to my existing standard or fast Ethernet networks?
7. What network performance will I get with the gigabit Ethernet card?
8. Can I use the Apple gigabit Ethernet card with single-mode fiber?
9. Can I netboot a Power Macintosh G3 client over a gigabit Ethernet card?
10. Can I use Gigabit Ethernet on my NetBoot server?
11. Where can I purchase cables or products to support gigabit Ethernet?

Question 1: What is gigabit Ethernet?

Answer: Gigabit is the next generation Ethernet standard which provides a theoretical, raw data bandwidth of 1000Mbps (or 1 gigabit per second). As network bandwidth becomes strained by new network applications and the proliferation of rich media data types, like graphics and video, gigabit Ethernet will become a cost-effective method of alleviating bandwidth bottlenecks. Gigabit Ethernet is based on the IEEE 802.3z standard approved by the IEEE organization in 1998. For more information on gigabit Ethernet, see http://en.wikipedia.org/wiki/Gigabit_Ethernet

Question 2: What differences are there between gigabit Ethernet and standard (10BaseT) or fast (100BaseT) Ethernet?

Answer: Gigabit Ethernet increases the speed at which data is transmitted. The access method, packet format, packet length, error control, back off algorithm, and management information is identical to the other Ethernet standards ensuring that existing network services and protocols will work identically between standard, fast, and gigabit Ethernet.

Question 3: What cables are supported by the Apple gigabit Ethernet card?

Answer: The Apple gigabit Ethernet card allows you to connect your computer to a 1000Base-SX Ethernet fiber optic network. The card uses a short wavelength laser to support 62.5 Micron Multi-Mode fiber cable up to 250m and 60 Micron Multi-Mode fiber cable with SC-style connectors. The card does not support standard unshielded twisted-pair (UTP), or Category 5, wiring. The gigabit Ethernet standard, IEEE 802.3ab, to support unshielded twisted-pair wiring, or1000BASE-T, has not been finalized yet by the IEEE organization.

Question 4: What Macintosh operating systems are supported by the Apple gigabit Ethernet card?

Answer: The Apple gigabit Ethernet card supports both Mac OS and Mac OS X Server. For Mac OS-based systems, you must use Mac OS 8.5.1 or later. The drivers to support the gigabit Ethernet card in Mac OS will be included on a CD when you purchase the Apple gigabit Ethernet card. The driver to support the gigabit Ethernet card in Mac OS X Server is already preinstalled in the operating system.

Question 5: Does the gigabit Ethernet card auto-switch between 10Mbps, 100Mbps, and 1000Mbps?

Answer: No, the gigabit Ethernet card does not operate at 10Mbps or 100Mbps.

Question 6: How do I connect a Macintosh with the gigabit Ethernet card to my existing standard or fast Ethernet networks?

Answer: Connecting a Macintosh with the gigabit Ethernet card requires a compatible router or switch that has both the fiber-optic gigabit Ethernet connector and standard Ethernet connectors. A number of vendors, including Cisco, 3Com, and Bay Networks, offer solutions for connectivity between gigabit Ethernet and other standard networks.

Question 7: What network performance will I get with the gigabit Ethernet card?

Answer: The theoretical limit to gigabit Ethernet is 1000Mbps. However, network throughput is dependant on your hardware configuration, network infrastructure, and software and therefore, will vary accordingly.

Question 8: Can I use the Apple gigabit Ethernet card with single-mode fiber?

Answer: No. The Apple gigabit Ethernet card only supports multi-mode fiber.

Question 9: Can I netboot a Power Macintosh G3 client over a gigabit Ethernet card?

Answer: No. A client can use only Apple's built-in Ethernet to connect to the NetBoot. There are no plans to support netbooting clients over third

party PCI network interfaces at this time.

Question 10: Can I use Gigabit Ethernet on my NetBoot server?

Answer: Yes, but the server's Gigabit Ethernet must be connected to a switch capable of handling it. Individual Netboot clients can then be connected to this switch using the built-in Ethernet.

Question 11: Where can I purchase cables or products to support gigabit Ethernet?

Answer: Visit your local computer retailer to find selections of gigabit ethernet networking equipment. Or, visit online computer parts retailers for more information.

PowerBook (Bronze keyboard and FireWire): Use of Weight Saving Device

My PowerBook G3 Series (Bronze keyboard) came with a Macintosh PowerBook G3 Series Weight-Saving Device. What is this for? The new PowerBook (FireWire) also has a similar device.
This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook G3 Series Weight-Saving Device can be used in either expansion bay to reduce the overall weight of the system. It is intended to replace the CD-ROM or DVD-ROM drive when you know you will not need the drive. If you use it to replace the battery, the computer will not be able to run unless you have the AC adapter connected and plugged in.

If you do run the computer without the AC adapter and battery installed, the backup battery will drain in approximately 4 minutes. This will cause the PowerBook to lose its date and time, and other internal settings. You will then need to connect the PowerBook to AC power for 24 hours to fully recharge the internal battery.

Because the new PowerBook G3 Series (Bronze keyboard) is thinner than previous PowerBook G3 computers, the Macintosh PowerBook G3 Series Weight-Saving Device will only work with this computer.
For more information on identifying the various PowerBook G3 computers, refer to TIL article 24604: "**PowerBook G3 & G3 Series: Identifying Different Models**".

Unlike some previous PowerBook Weight-Saving Devices, the Macintosh PowerBook G3 Series Weight-Saving Device is not designed to store items. Trying to open it will cause damage.
Published Date: Feb 20, 2012

Power Macintosh G3: DVD Troubleshooting

This article provides troubleshooting information for a variety of issues which may arise when playing DVD video. This information is mainly directed at Power Macintosh G3 computers though general DVD troubleshooting is still relevant to other DVD-ROM capable computers.
This article has been archived and is no longer updated by Apple.

Video Stutter During Playback of a DVD Movie

There are a number of possible causes for stutter when playing back a movie. Stutter is defined as a momentary pause in playback; either sound or video could be affected.

Possible causes are:

- Virtual memory is turned on.
- Speech or other background processes/applications can also cause stutter. Quit all other applications when viewing DVD video.
- The disc could be switching layers.
- The disc may be dirty. Try cleaning it with a soft cloth.

"Cannot find required hardware" Error Message

This error can occur when either the appropriate hardware is not detected, or if the appropriate software components are not detected. Refer to article 30887: "**Power Macintosh G3 (Blue and White): Apple DVD Player Cannot Open**" for troubleshooting tips.

Pixelation in Dark Areas

- Set the Bit Depth to Millions in the Monitors & Sound control panel.
- Switch resolution to 800 x 600 or 720 x 480 if available (only when connected to an external display).
- Choose normal size as opposed to full screen for the best quality image.
- Select best for video when watching on S-video device such as a television.

Low Sound Volume

- Check preferences and make sure Line In audio is not selected.

No Sound

- Make sure the Sound In source in the Control Strip is set to DVD.
- Try changing the sound setting when playing the movie by selecting the audio button on the DVD Controller.

Stops at Opening Window

- Press Return key and wait a few seconds. If the video has not started, press the spacebar.

Some Items in the Menu Are Not Able to be Selected

- Try using the arrow keys and the return key.

The DVD Disc Box Says "The DVD-ROM features will not work on a CD-ROM or a Macintosh computer."

Many features, including the ability to play the movie, are still available when using the Apple DVD player. Only features that require additional software to be installed are not available. For the most part, those features are likely to have software written for a Windows environment.

Movie Does Not Immediately Start

It takes a moment for the movie to load. The system software is accessing necessary information to decode the movie. It is completely normal and not indicative of any hardware or software failure.

PowerBook G3 Series (Bronze keyboard): Heatsink Reinstallation Tip

This article provides an important tip when reinstalling the processor heatsink in the PowerBook G3 Series (Bronze keyboard).
This article has been archived and is no longer updated by Apple.
When reinstalling the heatsink, for example after a memory upgrade, be sure that the ferrite bead on the display cable is not under the heatsink. If the ferrite bead is under the heatsink, the EMI gasket and ferrite bead will stack up possibly causing a slight bow in the keyboard after reinstallation.

Before screwing the heatsink down, gently push the ferrite bead towards the rear of the PowerBook creating the necessary clearance for the heatsink.

The following images show incorrect and correct alignment of the ferrite bead with regards to the processor heatsink.

Figure 1 Incorrect placement of ferrite bead.

Figure 2 Correct placement of ferrite bead.

ATI Video Accelerator Update: Description

This article provides a description of the ATI Video Software Update 1.0 available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.
This article has been archived and is no longer updated by Apple.
Important Information About the ATI Video Accelerator Update

The ATI Video Accelerator Update accelerates playback of certain types of QuickTime movies. This document describes the ATI Video Accelerator Update and when you need to install it.

What Is the ATI Video Accelerator Update?

The ATI Video Accelerator Update is a system extension that accelerates playback of certain types of QuickTime movies. It enhances the ATI Video Accelerator in the following ways:

- **Multiple Movies Can Be Accelerated**--Previously, only one movie could be accelerated at a time. With the update, the amount of video memory (VRAM) determines how many movies can be accelerated.

- **Overlapped Movies Can Be Accelerated**--Prior to the update, a movie would only be accelerated if all of it was visible. Now it will be accelerated even if a portion of it is hidden by another window.
- **No Flashes When Acceleration Starts**--When acceleration is turned on for a movie, a black or dark green flash will no longer be seen when acceleration starts.
- **Better Color Matching Between Accelerated and Non-Accelerated Movies**--Previously, there was a detectable difference between the color of an accelerated and non-accelerated movie. These color differences are lessened with the update.

Who Needs to Install the ATI Video Accelerator Update?

The following computers, running Mac OS 8.6, which use the ATI Video Accelerator will benefit from the ATI Video Accelerator Update:

- All iMac *
- All PowerBook G3 Series
- All Power Macintosh G3
- Power Macintosh 4400, 5500, 6500
- Twentieth Anniversary Macintosh

***Note:** Although the ATI Video Software Update does not contain performance enhancements for ATI Rage II-based iMac computers, the software can be installed on a Series 1 iMac running Mac OS 8.6.

Below is a list of the ATI extensions that will be present after installing the update:

Extension Name	Minimum Version
ATI 3D Accelerator	4.5.3
ATI Graphics Accelerator	3.8.7
ATI Resource Manager	1.2.1
ATI Rage 128 3D Accelerator	5.2.9
ATI Video Accelerator	4.2.2
QuickDraw 3D	1.5.4
QuickDraw 3D RAVE	1.5.4

Is the ATI Video Accelerator Still Required?

Yes, the update is meant to complement the ATI Video Accelerator, not replace it. Eventually the update will be merged into the ATI Video Accelerator.

I Don't Notice Any Performance Improvement After Installing the Update.

With QuickTime 3.0, certain Macintosh models are not able to take advantage of the update due to hardware constraints in the RageII+, RageIIc, LT-G, and 264GT-B. QuickTime 4.0 provides acceleration of movie playback computers with these graphics controllers. Additionally, the performance benefits of the update will only be seen at thousands or millions of colors.

Movie Playback is Choppy at Large Display Resolutions.

Though the Rage 128 can easily play back a movie at any display resolution, movie playback might be choppy on the Rage II+, RagePro, RageIIC, LT-G, LTPro, and 264GT-B. Set the display to 1024 x 768 (or smaller) at thousands of colors to avoid this problem.

iMac: How to Resolve Intermittent Pause During Usage

This article documents an iMac issue where the computer appears non-functional though the mouse cursor still moves.
This article has been archived and is no longer updated by Apple.
Apple has received reports from customers that their iMac will appear to pause or stall for about 10 seconds during normal use. This has been attributed to a situation where there is no CD in the CD-ROM drive.

Apple has posted a new version of the iMac CD Update which corrects an intermittent delay that can occur on some iMac models when the above situation is encountered. For best performance, all iMac users should install this new update which incorporates the iMac CD Update 1.0.

The iMac CD Update utility is available for download from the Apple Software Updates web site at http://www.apple.com/swupdates. Use "iMac and CD" as your search query.

Another potential cause of pausing is related to using a DHCP and is resolved in Mac OS 9 and later with Open Transport 2.6 and later. Please refer to article 60400: "**Mac OS 8.6: Computer Pauses Every Five Minutes On DHCP**" for more information.

Published Date: Feb 20, 2012

Macintosh: Moving Applications to a New Computer

I copied a number of my applications from my old Quadra 800 to my new iMac and many of them fail to run properly. On occasion, I receive a -192 error message.
This article has been archived and is no longer updated by Apple.
When upgrading to a new computer, for best performance reinstall the applications from the original disc to ensure that all the required files are present and in the proper location. This is particularly true when upgrading to a computer with a PowerPC processor because the application code is different depending on what computer the application was installed on.

Most current applications are written specifically to take advantage of the PowerPC processor. To be compatible with both older Macintosh computers and those based on the PowerPC processor, the Installer will build the application depending on what computer it is running on. If you were running AppleWorks on the Quadra 800 and dragged the application to the iMac, it would not function properly because the code necessary for AppleWorks to run on the iMac is not there. The likely result would be a -192 system error, or other unexpected behavior.

When you install your software, if the Installer prompts you to select the type of computer you have, be sure you select the installation for a PowerPC computer. Your software should function properly assuming it is the most current version for your particular computer or version of Mac OS.

Note: Be aware that the license agreement for your software may not allow the same copy of the program to be installed on more than one computer. Refer to the license agreement which accompanied the software or contact the vendor for specific information.

iBook: How to Determine Battery Charge Status

This document explains how you can tell if your iBook battery is fully charged.
This article has been archived and is no longer updated by Apple.
iBook, iBook SE and iBook (FireWire) computers

There are a number of ways to determine if the battery has a full charge:

- If the battery is being charged, the AC power port on the rear of the iBook will glow amber. It changes to green when the battery has a full charge.
- The battery icon in the menu bar will have a lightning bolt through it when the battery is charging. The lightning bolt disappears when the battery is fully charged.
- The battery icon in the Control Strip will show the same lightning bolt when charging. It also disappears when the battery is fully charged.

The Lithium-Ion iBook battery will take approximately 2 hours to fully recharge when in sleep mode or when shut down. If the computer is running, the charge time doubles to approximately 4 hours.

iBook (Dual USB) and later

When the battery on these computers is fully charged, the four battery lights (located on the bottom of the computer) will glow green.

For more information on identifying your iBook model, refer to document 88039: "**iBook: How to Identify iBook Models**"

Apple Cinema Display: Description

This article describes the Apple Cinema Display.

This article has been archived and is no longer updated by Apple.
The Apple Cinema Display brings an entirely new visual perspective to the desktop computing experience. With an enormous virtual workspace, elegant industrial design, and industry-leading all-digital LCD technology, it's perfect for those who have been waiting to own the highest-performance LCD flat-panel display available. And the combination of the powerful Apple Power Mac G4 computer with the many unique features of the Apple Cinema Display makes this the ideal solution for creative professionals.

If you work with large, unwieldy page layouts, manipulate complex 3D models, or edit QuickTime movies, this display is made for you. Its unique wide format and high-resolution 22-inch (diagonal) screen provide an incredibly large work area. You can display DVD movies in their native HDTV format without the annoying letterbox, making the display a perfect companion for use with Apple's DVD player or Final Cut Pro software. And even with two full pages of text and graphics displayed on screen simultaneously, there's still plenty of room for tear-off menus, palettes, and tool bars. With all this extra space to work, you'll spend a lot less time scrolling or toggling between windows.

Those who work in graphics-intensive professions will appreciate the Apple Cinema Display's technical innovations. Using a pure digital interface, it delivers distortion-free images every time. The display supports a true 16.7 million colors and uses the latest wide-angle viewing technology to ensure that colors appear consistently and uniformly, from edge to edge. All of this behind-the-scenes technology makes the Apple Cinema Display easy on your eyes, day in and day out-something you'll appreciate next time you're burning the midnight oil.

Although its virtual workspace is enormous, the Apple Cinema Display takes up only a small part of your physical desktop-and quite attractively, at that. Its elegantly streamlined industrial design includes many built-in conveniences, such as a two-port self-powered USB hub that makes it easy to connect USB devices such as your keyboard or other peripherals. A patented hinge design lets you effortlessly adjust the screen to your preferred viewing angle, and a handy one-button switch lets you turn on the display and the Power Mac G4 at the same time-or put your system to sleep and awaken it at a touch.

The Apple Cinema Display-you'll never look at your work the same way again.

Spectacular display performance

- 22-inch (diagonal) thin film transistor (TFT) active-matrix liquid crystal display delivers bright, sharp textand graphics.
- Wide-format design with 1,600 by 1,024 pixels displays two full pages of text or full-screen DVD movies.
- Designed to work with the Power Mac G4 digital graphics interface for distortion-free images.
- Lightning-fast pixel response supports full-motion digital video playback.
- Extrawide (160°) viewing angle maximizes visibility and color performance.
- Support for a true 16.7 million colors for use in all graphics-intensive applications.

Simple, elegant design

- Streamlined design minimizes desktop footprint.
- Built-in two-port USB hub for easy connection of peripheral devices.
- Integrated stand makes adjustment of viewing angle effortless.
- Unique integrated cable simplifies connection and minimizes desktop clutter.
- Power/instant-on switch turns on both the display and the computer simultaneously, or puts the system in and out of sleep mode.
- Complies with strict TCO 95 standards for low power consumption, low emissions, and recyclability.

Power Mac G4: Using Apple System Profiler to Identify Video Card

This article describes how to use Apple System Profiler to identify the video card installed in a Power Mac G4 computer.
This article has been archived and is no longer updated by Apple.
Apple System Profiler will correctly identify a Power Mac G4 (PCI Graphics) computer running Mac OS 8.6 only. Look in the Hardware overview section next to the product name to determine the Power Mac G4 model. However, the current version of Apple System Profiler will not correctly identify the display card in the Power Mac G4 (AGP Graphics) running Mac OS 9 or Mac OS 8.6, and the Power Mac G4 (PCI Graphics) computers running Mac OS 9.

To determine if you have a PCI Graphics or an AGP Graphics version of the Power Mac G4 computer, refer to article 58418: "**Power Mac G4: How to Differentiate Between Models**".

Published Date: Feb 20, 2012

Mac OS: Select a Startup Disk to Reduce Start Up Time

Is it necessary to select a startup disk from within the Startup Disk control panel? I did not do it and it seems to take quite a long time for my computer to start up.
This article has been archived and is no longer updated by Apple.
Power Macintosh computers that use the ROM-in-RAM (otherwise known as New World) architecture, such as the Power Mac G4 or PowerBook (FireWire), will take longer to start up unless the drive that contains the active system folder and the Mac OS ROM file is selected in the Startup Disk control panel.

If you do not have a drive selected there, the computer has to scan through all the available interfaces where a start up device can be found, including SCSI (if installed), IDE, any network port, and USB. This takes some time to do, so the length of time to start up the computer is extended.

All you need to do is select the appropriate disk in the Startup Disk control panel, on the next restart you should notice an reduction in the amount of time it takes to start up your computer.

Power Mac G4 (PCI Graphics): Upgrading Memory

This article provides the memory specifications and upgrade options for the Power Mac G4 (PCI Graphics). Article 58426: "**Power Mac G4 (AGP Graphics): Upgrading Memory**" has information on upgrading the RAM in that Power Mac G4.

This article has been archived and is no longer updated by Apple.
The Power Mac G4 logic board provides four PC-100 DIMM slots that work with industry standard PC-100 DIMMs of up to 256 MB each for a total of 1 GB. The Power Mac G4 works with 64Mbit and 128Mbit RAM. The memory should be rated at 8ns or faster.

Compatible DRAM DIMMs must meet all the following specifications:

- PC-100 Synchronous DRAM (SDRAM)
- 3.3 volt
- 64-bit wide, 168-pin module
- Maximum of 16 memory devices on the DIMM
- Unbuffered; do not use registered or buffered Synchronous DRAM (SDRAM)
- Maximum height of 2.0 inches.

The computer comes from Apple with one DIMM slot populated with a 64 MB DIMM. Additional DIMMs can be installed in any order, in any size. There is no performance benefit to matching DIMM sizes or installing them in pairs.

Published Date: Feb 20, 2012

Power Mac G4 (AGP Graphics): Upgrading Memory

This article provices the memory specifications and upgrade options for the Power Mac G4 (AGP Graphics). Article 58425: "**Power Mac G4 (PCI Graphics): Upgrading Memory**" has information on upgrading the RAM in that Power Mac G4.
This article has been archived and is no longer updated by Apple.
The Power Mac G4 logic board provides four PC-100 DIMM slots.

Compatible DRAM DIMMs must meet all the following specifications:

- PC-100 Synchronous DRAM (SDRAM)
- 3.3 volt
- 64-bit wide, 168-pin module
- Maximum of 16 memory devices on the DIMM
- Unbuffered; do not use registered or buffered Synchronous DRAM (SDRAM)
- Maximum height of 2.0 inches.

Note: Although 2 GB can be installed, a maximum of 1.5 GB can be addressed through the Finder in the Mac OS.

The computer comes from Apple with one DIMM slot populated with a 128 MB DIMM. Additional DIMMs can be installed in any order, in any size. There is no performance benefit to matching DIMM sizes or installing them in pairs.

Power Mac G4: Video Card Memory and Resolutions Supported

The video card in a Power Mac G4 cannot be upgraded; it already has the maximum allowable memory (16 megabytes) installed.
This article has been archived and is no longer updated by Apple.
Both the AGP and PCI cards come with 16 MB of memory installed; they are not upgradeable beyond that amount.

The following resolutions are supported:

640 x 480 @ 85 Hz
640 x 480 @ 75 Hz
640 x 480 @ 72 Hz
640 x 480 @ 67 Hz

640 x 870 @ 75 Hz

800 x 600 @ 85 Hz
800 x 600 @ 75 Hz
800 x 600 @ 72 Hz
800 x 600 @ 60 Hz
800 x 600 @ 56 Hz

832 x 624 @ 75 Hz

1024 x 768 @ 85 Hz
1024 x 768 @ 75 Hz
1024 x 768 @ 70 Hz
1024 x 768 @ 60 Hz

1152 x 870 @ 75 Hz

1280 x 960 @ 75 Hz

1280 x 1024 @ 85 Hz
1280 x 1024 @ 75 Hz
1280 x 1024 @ 60 Hz

1600 x 1200 @ 85 Hz
1600 x 1200 @ 75 Hz
1600 x 1200 @ 70 Hz
1600 x 1200 @ 65 Hz
1600 x 1200 @ 60 Hz

1920 x 1080 @ 72 Hz
1920 x 1080 @ 60 Hz

USB Info and Benefits of Dual-Channel USB

What are the benefits of dual-channel USB? Is there anything else new with regards to USB?
This article has been archived and is no longer updated by Apple.

Universal Serial Bus (USB)

The Power Mac G4 (AGP Graphics) and iMac (Slot-Loading) incorporate a separate 12-Mbps USB controller for each USB port. Now there is the potential to connect up to 127 devices to each port, as opposed to earlier USB-enabled Macintosh computers that support up to 127 devices connected to both USB ports.

What's New to USB?

Beginning with the Power Mac G4 (AGP Graphics) and the iMac (Slot-Loading), two new features to USB are most apparent: support for USB audio devices and booting from USB drives.

USB Audio Devices: This includes any device also that supports the Isochronous USB protocol (which are mostly Audio in nature). This includes USB speakers, microphones, and other recording/playback devices.

Bootable USB drives: A storage device such as a SuperDisk, Zip disk, or other USB storage drive can be used to hold a valid system folder and used at startup.

USB Specifications

- two Universal Serial Bus (USB) Type A ports
- a maximum of 500 Milliamps (mA) at 5 volts (V) is available per port, for a total of 1 ampere.
- data transfer rates:
    - low-speed: 1.5 megabits per second (Mbps) maximum
    - high-speed: 12 Mbps maximum

iBook: Description of Charging Contacts on Underside

This article describes the two small contacts on the underside of the iBook.
This article has been archived and is no longer updated by Apple.
On the bottom of the iBook above the battery cover are alternative battery charging contacts, shown in the image below. These contacts provide an alternate method for charging the iBook's battery in addition to the AC Adapter. An example would be a rack system where multiple iBook computers could be charged simultaneously, each in their own charging bay.

Apple does not sell a battery recharging station that takes advantage of these battery charging contacts, but a third party company may release one.

Power Macintosh G3/G4: Black Screen After Installing ATA Zip Drive

After installing an internal Iomega Zip drive on a Power Macintosh G3 (Blue and White), the computer starts up with a black screen.
This article has been archived and is no longer updated by Apple.
On Power Macintosh G3 (Blue and White) and Power Mac G4 computers, it is important to make sure that the power cable is connected to the internal Zip drive before powering up the computer. If only the data cable is connected, the computer will start up to a black screen.

If this should occur, power down the computer and make sure both the data and power cables are properly connected to the internal Zip drive then restart the computer. If the situation persists, consult your Apple Authorized Service Provider for further troubleshooting.

Portable Computers: Models Which Do Not Have a Backup Battery

This document describes which portable Macintosh computers do not contain a backup battery and what this means.
This article has been archived and is no longer updated by Apple.

Portable Macintosh Computers without a Backup Battery

- iBook (all models)
- iBook G4 (all models)
- PowerBook G4 (12-inch) (all models)

Changing a Battery in a Portable Without a Backup Battery

Because there is no backup battery in the portable computers listed in the section above, additional care should be taken ensure the AC adapter is plugged in.

Removing the Main System Battery without AC Power

When removing the main battery without the AC Adapter, the computer should be shut down since the contents of RAM are lost when no power is available. There is a small capacitor that maintains the system clock long enough to swap the main battery.

iBook: Trackpad Clicking Not Enabled by Default

While the iBook trackpad does support clicking and dragging, it is not enabled by default. This article notes the location of the trackpad button, as well as how to enable trackpad clicking.
This article has been archived and is no longer updated by Apple.
The iBook trackpad button is located just below the trackpad, as shown in the graphic below.

Figure 1, Location of trackpad button

To enable trackpad clicking and dragging, follow these steps:

1. Open the Trackpad control panel.
2. Click in the checkbox marked Clicking, as shown in the graphic below. This will make the Dragging and Drag lock check boxes active. Check them if you desire those features.
3. Close the Trackpad control panel.

Figure 2, Trackpad control panel

iBook: How to Record Sounds

This document explains how to record sounds with iBook computers.
This article has been archived and is no longer updated by Apple.
How you record sounds depends on the model iBook computer you have. See the appropriate section below.

iBook and iBook (FireWire)

To record sounds, you must purchase an external microphone that connects to the computer's Universal Serial Bus (USB) port. Click the Macintosh Products Guide link on the Apple USB Web site (http://www.apple.com/usb/) to find a USB microphone. Follow the instructions that come with your microphone to record sounds.

iBook (Dual USB)

The iBook (Dual USB) has a built-in microphone you can use to record sounds. Follow these steps:

1. Open the Sound control panel. (See Figure 1.)

Figure 1 Sound control panel

2. Click the Input tab. Click Built-In Mic to select it as the input source. (See Figure 2.)

Figure 2 Sound input source

3. Click the Alerts tab.

4. Click New Sound. The Record New Sound window appears. (See Figure 3.)

Figure 3 Record New Sound window

5. Record and save your sound using the controls in the Record New Sound window.

PowerBook G3 Series (Bronze keyboard): Restoring Battery Functionality After Deep Discharge

You may notice a red X through the battery icon in the menu bar of a PowerBook G3 Series (Bronze keyboard) indicating the battery is not installed when in fact it is. When viewing the Control Strip module for the battery, it is not shown there either.

This article has been archived and is no longer updated by Apple.
In some cases, the battery has gone into a deep discharge state. This situation may arise if the battery has been left in the computer for an extended period of time without AC power. The battery can discharge to a point where it is no longer recognized by the PowerBook as evidenced by the red X through the battery icon in the menu bar.

To help prevent this situation, try these suggestions:

- Recharge the battery when only one of the four green LEDs (Light Emitting Diode) on the battery is on, or shows one green LED blinking.
- If the PowerBook is not going to be used for an extended period of time, fully charge the battery and then remove it from the PowerBook for storage.

If you have a battery that is not recognized in the menu bar while inserted, the following steps provide sufficient charge to the battery to restore normal operation.

1. Insert the battery in either bay and leave it there for approximately 30 seconds.

2. After 30 seconds, release the battery and pull it out so that it protrudes from the bay approximately one inch, you do not need to fully remove the battery from the bay.

3. Leave the battery extended for several seconds then reinsert it for another 30 second interval.

Depending on the charge level of the battery, you may need to reinsert the battery 10 to 12 times. After the battery appears in the Control Strip and the red X no longer appears in the menu bar with the battery inserted, allow the battery to fully charge.

Apple has posted a system software extension named Battery Reset 2.0 that can be used to recover a battery that does not accept a charge. You may download the Battery Reset 2.0 software from the Apple Software Updates web site at http://www.apple.com/swupdates.

What to do if your iBook won‘t run on battery

Your iBook should work when it's plugged in to the power adapter and on a charged battery. If it only works when it's plugged in, try the tips below. These tips are good for iBook through iBook (FireWire) models.
This article has been archived and is no longer updated by Apple.
If the battery doesn't appear in the Mac OS 9 control strip or has a red X through it, install the Battery Update 2.0. It's available from Apple Downloads.

1. Make sure the battery is fully charged. Use the proper power adapter for your iBook computer. If it is not charging, try a different power outlet. The power connector on the iBook glows amber if the battery is accepting a charge. It glows green once the battery is fully charged. If the power connector does not glow, there may be an issue with the AC adapter or power outlet.
2. Remove the battery and reinsert it making a good, solid contact with the iBook.
3. Reset the Power Manager.
4. Try a different battery.
5. Replace the battery.

Power Mac G4 (AGP Graphics): Single Channel SCSI Cards May Interfere with Wake From Sleep

When the Power Mac G4 (AGP Graphics) enters sleep mode with a single channel PCI SCSI card installed, the computer may incorrectly assume the card supports PCI power down mode and not wake properly from sleep.
This article has been archived and is no longer updated by Apple.
Note: This issue is resolved with Mac OS 9.

When the computer goes to sleep, as a function of Power Manager 2.0, power to the PCI bus and the system fan are turned off to conserve energy. The PCI power should only be turned off if all installed PCI cards support this mode, a component of Power Manager 2.0. If the PCI card does not support this mode, the computer should not enter this state.

In this case, the card does not support Power Manager 2.0, but the card allows PCI power down and is then unable to awake from sleep correctly. Installing Mac OS 9 will resolve this issue, allowing the computer to go to sleep, without PCI power down and wake up properly. Another workaround is to disable system sleep in the Energy Saver control panel.

Note: This issue can affect only the AGP version of the Power Mac G4 with an Apple or third party single channel SCSI card installed.

Why iBook display is not as sharp in 640 x 480 Mode

This article has been archived and is no longer updated by Apple.

The sharpness of the LCD panel in the iBook computer may vary depending on the selected resolution.

Traditionally LCD panels have been limited to one resolution because the panels are digital in design and have a fixed number of pixels. In the case of the original iBook and FireWire iBooks, that native resolution is 800 x 600. For white iBooks, the native resolution is 1024 x 768.

With new video technology you can now scale the size of the image on an LCD screen. On the original iBook and FireWire iBooks, the built-in 12-inch display can switch from the native 800 x 600 resolution to a scaled resolution of 640 x 480. The new image is remapped into the fixed pixel space of LCD panel. This remapped image is optimized by interpolation and anti-aliasing technology. Because the image is being remapped, the scaled resolutions will not appear as sharp as the native resolution.

For the white iBooks (both 12-inch and 14-inch models), the display can switch from the native 1024 x 768 resolution to a scaled resolution of 800 x 600 and 640 x 480. As with the earlier iBooks, the new image will not appear as sharp as the native resolution.

The advantage of having a scaleable resolution is some applications, mainly games, may only run at 640 x 480. If the display did not allow you to switch resolutions, you would not be able to use these applications.

Additional information on how to switch resolutions can be found in the Mac Help section under the Help menu.

iBook: Sound Capabilities

Learn about the sound capabilities of the iBook computers.

This article has been archived and is no longer updated by Apple.

The iBook has compact disc quality stereo audio circuitry. The sound system supports a sample rate of 44.1 kHz and sample sizes up to 16 bits.

Internal Speaker

The iBook has one built-in mono speaker located between the keyboard and the display on the left-hand side. All white iBook G3 and iBook G4 computers have two stereo speakers. The computer turns off the sound signal to the speakers when headphones are connected to the headphone or audio jack.

Sound Out port

The sound out port is a 16 bit stereo mini-jack located on the left side of the computer at the left palm rest. The headphone jack is configured to drive a pair of low-impedance stereo headphones. External powered speakers may also be connected to the headphone jack. Using this port or the USB port, one can connect two speakers for stereo sound.

Sound In

The iBook does not have a microphone or sound input jack. The USB port does support a USB microphone to allow for sound input into the iBook.

All white iBook G3 and iBook G4 computers have a built-in microphone.

USB Sound Support

You can attach USB speakers to get stereo sound. Also you can attach a USB microphone for sound in.

Function Keys

The function keys on the keyboard can be used to increase, decrease and mute the sound.

- F3 will decrease the sound volume
- F4 will increase the sound volume
- F6 will mute the sound.

Internal Modem

The internal modem will send the handshaking audio to the sound system so the user can hear the status of a dial-up modem connection. The level of handshaking audio is fixed. The handshaking audio is mixed into the sound output stream.

Optical Drives

Digital audio signals from the optical drives are sent to the speaker and the headphone jack.

iMac (Slot Loading): Memory Specifications and Upgrades

This article provides the memory specification and expansion capability for the iMac (Slot Loading) computer.
This article has been archived and is no longer updated by Apple.
The iMac (Slot Loading) computer uses standard PC-100 DIMMs with the following specifications:

- PC-100 Synchronous DRAM (SDRAM)
- 64-bit wide, 168-pin module
- maximum of 16 memory devices on the DIMM
- unbuffered; do not use registered or buffered Synchronous DRAM (SDRAM)
- maximum height of 50 mm.

There are two DIMM slots accessible from the bottom of the computer. Use a coin, like a quarter, to release the access panel and install the DIMM or DIMMs.

The maximum DIMM size for each slot is 512 MB, for a total of 1 GB. The base memory configuration varies depending on the iMac model you purchased. The base model has 64 MB, the iMac DV has 64 MB, and the iMac DV Special Edition has 128 MB.

There is 8 MB of soldered SDRAM dedicated for video. Although it's not upgradeable, iMac can display 24-bit color at its highest resolution. In addition, the computer now uses AGP2X to make use of main memory for 3D rendering.

Published Date: Feb 20, 2012

iMac (Slot Loading): DVD Movie Playback

The iMac DV models provide the ability to view DVD movies via the built-in DVD-ROM drive.
This article has been archived and is no longer updated by Apple.
iMac uses software called Apple DVD Player to play DVD movies. iMac currently ships with a preview version (2.0b2). Apple expects to post a finished version on our Web site soon that can be downloaded at no charge.

The final version will only work on systems that came pre-installed with the preview version.

iMac (Slot Loading): What‘s New and Different

This article lists the major new features of iMac (Slot Loading), as well as a brief description of each feature.

This article has been archived and is no longer updated by Apple.
Here are the major new features of iMac:

- Slot loading CD- or DVD-ROM drive - Rather than using a tray to hold the disc, the iMac (Slot Loading) has a slot similar to an automotive CD player. Simply insert any 120-millimeter disc into the slot and iMac takes it from there.
- The iMac DV models have a slot loading DVD-ROM drive in place of the CD-ROM drive.
- VGA Mirroring - There is a VGA port on the iMac DV models that provides the capability to connect an external VGA style monitor to mirror the image on the iMac screen.
- FireWire - There are two 400 Mbps FireWire ports on the iMac DV models for use with high-speed FireWire devices such as video camcorders and hard drives. More information on FireWire and FireWire devices can be found at http://www.apple.com/firewire/.
- Firewire cable - To enable early adopters to get started making movies quickly, Apple is including as a special bonus, an Apple-designed FireWire (4-6 pin) cable in the box with iMac DV models. This is being provided while supplies last.
- Wireless networking ready - The iMac is ready to accept the an AirPort card. An antenna is built-in to the iMac enclosure.
- Better sound - The front speakers of iMac provide improved mid and high range sound, while a speaker port on the underside of iMac improves low end bass response.
- Dual Channel USB - Each USB port now has its own dedicated USB controller providing enhanced functionality such as USB booting and USB audio support.
- No System Fan - The iMac (Slot Loading) does not have an internal system fan. Instead, it relies on convection for cooling.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

iMac (Slot Loading): Differences Between Models

This article documents the differences between models of the iMac (Slot Loading) computer.
This article has been archived and is no longer updated by Apple.
This table documents the major feature differences between the three iMac models introduced in September, 1999.

Feature	iMac	iMac DV	iMac DV Special Edition
Color	Blueberry	Tangerine, Blueberry, Strawberry, Grape, Lime	Graphite
Hard Drive	6 GB	10 GB	13 GB
Memory	64 MB	64 MB	128 MB
Processor	350-MHz G3 processor	400-MHz G3 processor	400-MHz G3 processor
CD or DVD Drive	CD-ROM	DVD-ROM	DVD-ROM

Published Date: Feb 20, 2012

iMac (Slot Loading): Technical Specifications

This article provides the technical specifications for the iMac (Slot Loading) computer.

This article has been archived and is no longer updated by Apple.
Technical Specifications

Processor and Memory

- 350 MHz or 400 MHz PowerPC G3 processor
- 512K backside level 2 cache
- 100 MHz system bus
- 64 MB or 128 MB of PC100 SDRAM (3.3-volt, 64-bit wide, 168-pin, running at 100 MHz); two DIMM slots support up to 512 MB each using 64 MB, 128 MB, 256 MB, or 512 MB DIMMs

Display

- Built-in 38 cm shadow-mask CRT (35 cm diagonal viewable image size); 0.28 mm dot pitch
- Built-in ColorSync color calibration for uniform color from input to display to output
- On-screen geometry adjustment to keep display images properly aligned throughout its lifetime
- Flip foot for 17° tilt

Graphics Support

- ATI RAGE 128 VR 2D/3D graphics accelerator with 8 MB of SDRAM graphics memory and AGP 2X support
- Three crisp, flicker-free screen resolutions: 640 x 480 pixels at 117 Hz, 800 x 600 pixels at 95 Hz, and 1024 x 768 pixels at 75 Hz
- 24-bit true color at all resolutions for displaying millions of colors

Storage

- 6 GB, 10 GB, or 13 GB Ultra ATA hard disk drive
- Slot-loading, 24x-speed (maximum) CD-ROM drive; or slot-loading, 4x-speed (maximum) DVD-ROM drive (plays DVD-Video discs; plays CD-ROMs at up to 24x speed)
- Support for external USB storage devices; DV models also support external FireWire storage devices

Communications

- Built-in 56K modem supports V.90 and K56flex standards (RJ-11 connector)*
- Built-in auto-switching 10/100BASE-T Ethernet (RJ-45 connector)
- AirPort wireless networking slot for optional AirPort Card; runs at up to 11 Mbps; 50 m maximum range (depending on surrounding environment); 2.4 GHz frequency; nominal power output of 15 dBm; compatible with other devices that comply with the IEEE 802.11 and 802.11HR specifications.

Note: An AirPort Card slot is not an option in the 350 MHz model.

Peripheral connections

- Two USB ports running at up to 12 Mbps each; provides up to 500 milliamps per port to support bus-powered devices
- Two, 6-pin FireWire (IEEE 1394) ports running at up to 400 Mbps (DV models only); provides 6 watts of power to support bus-powered devices

Audio

- Integrated, high-performance Odyssey audio system from Harman Kardon
- Built-in microphone for speech recognition and audio recording
- Front-mounted dual mini headphone jacks
- Analog audio input and output minijacks; up to 16-bit stereo and 44.1kHz sampling rate
- Support for external USB audio devices

Video (DV models only)

- Standard VGA output port (15-pin mini D-Sub connector)
  - Supports video mirroring: external devices display an image identical to that shown on the built-in display

Keyboard and Mouse

- Apple USB Keyboard
  - Integrated two-port USB hub with two Type A USB connectors
  - Two-position adjustable slope (0° and 6°) using flip foot
  - 12 programmable function keys
- High-resolution (400 dpi) Apple USB Mouse

Electrical Requirements and Agency Approvals

- Line voltage: 100 V to 260 V
- AC Frequency: 47 Hz to 63 Hz, single phase
- Maximum continuous power: 150 W
- EPA ENERGY STAR compliant

Environmental Requirements

- Operating temperature: 10 °C to 35 °C
- Storage temperature: -40 °C to 47 °C
- Relative humidity: 5 percent to 95 percent noncondensing
- Maximum altitude: 3000 m

Size and weight

- Height: 38 cm
- Width: 38 cm
- Depth: 43.5 cm
- Weight: 15.8 kg

*Actual modem speeds lower; speed depends on connection rate and other factors.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Published Date: Feb 20, 2012

iBook: Embossed Image on Battery Cover

The iBook battery cover looks different from the other colored plastics on iBook due to an image being embossed onto the underside. This image may appear to be heat damage though it is not.
This article has been archived and is no longer updated by Apple.
When you lift the battery cover up, it may appear that there is damage to the plastics. This is not the case, it is simply the underside of the image silkscreened on the cover and is no cause for alarm.

If you look closely at the battery cover, you will see a small representation of the default desktop picture that appears on the iBook screen. The other colored plastics have no image behind them. This is normal, we wanted to give the battery cover a unique appearance from the rest of the plastics.

The following image shows the top of the battery cover. While the Tangerine iBook battery cover has been used for example purposes, the Blueberry cover has a similar image on it.

Figure 1 iBook battery cover

iBook: Where to Find Nanosaur

This article provides information on where Nanosaur can be found on iBook.
This article has been archived and is no longer updated by Apple.
The Nanosaur game was not installed on the iBook's hard drive. The installer is on the iBook Install CD. If you insert the iBook Install CD and open the Applications folder on th CD you will see the Nanosaur folder. To install the game run the "Nanosaur 1.1.6 Installer" located in the Nanosaur folder.

The iBook Restore CD does not contain the Nanosaur game. If the Restore option to "erase before restoring" is chosen you will need to install the game from the iBook Install CD again.

iBook, PowerBook (FireWire): When to Use the Escape Key During Startup

This document explains how to use the Escape key (esc) if the computer does not start up properly. This is only relevant when "Preserve memory contents on sleep" has been selected in the Energy Saver control panel.
This article has been archived and is no longer updated by Apple.
If you select the "Preserve memory contents on sleep" option in the Energy Saver control panel, the computer protects your RAM contents during sleep by saving all of your open work to a hidden file on the hard disk. See technical document 60429, "**iBook: Description of Preserve Memory Contents on Sleep**" for more information.

Note: For compatibility reasons, the Preserve Memory Contents on Sleep feature has been removed in Mac OS 9 versions 9.0.4 and later. You may still see the option in the Energy Saver control panel but it will be dimmed.

In some rare circumstances, the computer may have trouble reading this file, and will not start up properly. If this happens, restart the computer and immediately press the Escape key. Hold down the key until you see the Happy Mac icon, then release the key.

Important: All RAM contents are lost when doing this. Pressing the Escape key at startup tells the iBook or PowerBook (FireWire) computer to bypass reloading the RAM file, and to start up normally.

Published Date: Feb 20, 2012

PowerBook & iBook: Will Not Sleep When Speakable Items is Active

My PowerBook (or iBook) will not go to sleep when Speakable Items is enabled from the Speech control panel. Is this normal?
This article has been archived and is no longer updated by Apple.
Yes, this is normal. When the sound input driver is in use (this driver is activated by the Speakable Items selection in the Speech control panel) a PowerBook or iBook will not go to sleep on its own. However, it will still go to sleep manually when you select Sleep from the Special menu or when you close the lid.

If you would like your PowerBook or iBook to go to sleep after the time specified in the Energy Saver control panel, you must turn Speakable Items off.

Also, third-party applications may enable speech recognition without notifying you. If such an application is open, the computer will not sleep on its own.

Published Date: Feb 20, 2012

About Your Apple Dual Channel Ultra2 LVD SCSI Card, Version 2

This article provides information regarding the Ultra2 SCSI card version 2. This card has only been certified for use on the Power Mac G4 (AGP Graphics) and is not supported on other Power Macintosh computers.
This article has been archived and is no longer updated by Apple.

About Your Apple Dual Channel Ultra2 LVD SCSI Card, Version 2

Your Dual Channel Ultra2 LVD SCSI card (version 2) is a peripheral component interconnect (PCI) card that allows you to connect devices that use the Small Computer System Interface (SCSI). You can connect internal or external SCSI devices such as disk drives, CD-ROM drives, scanners, and other devices. A SCSI port permits high-speed communication between the computer and the device.

You connect internal and external SCSI devices to the card using SCSI cables. Your card also comes with a 68-pin VHDCI to 68-pin connector cable for connecting 68-pin devices. You can purchase SCSI cables from an Apple-authorized dealer or retailer.

Advantages of Your Dual Channel Ultra2 LVD SCSI Card

Your Dual Channel Ultra2 LVD SCSI card has two data channels and uses Low Voltage Differential (LVD) technology.

This technology provides the following benefits:

- High data transfer rates: Your card can transfer information over a single channel at up to 80 megabytes (MB) per second, twice as fast as Ultra SCSI devices.
- Connect more devices: You can connect up to a total of 30 SCSI devices to the card (15 per channel) internally and externally (limited by the type of devices and the number of internal devices your computer is designed to hold).
- Use of longer cable lengths: The cables used to connect a chain of Ultra2 SCSI devices can be up to 12 meters (about 39 feet) long facilitating easy positioning of external devices.
- Compatible with older SCSI devices: You can connect other SCSI devices that are not as fast as the Ultra2 SCSI, such as Wide Ultra, Narrow Ultra, Fast, and standard SCSI devices.

Note: Older SCSI devices must use SCSI Manager 4.3-compliant drivers. To determine if your device works with SCSI Manager 4.3, see your SCSI device documentation.

Connecting SCSI Storage Devices

You can connect SCSI devices in a chain. The first device connects to one of the SCSI card's connectors, the next device connects to the first SCSI device, and so on.

The card has an external cable connector for external SCSI devices and an internal connector for internal devices.

Channel 1 serves the 68-pin VHDCI external cable connector. Channel 2 serves the 68-pin internal connector.

All devices connected to the channel 1 connector are part of a single SCSI chain. Likewise, all devices connected to the channel 2 connector are part of another SCSI chain. You can connect up to 15 total devices to each channel for a total of 30 devices (although your computer will not be able to house this many devices internally.)

About Channel Data Transfer Rates

The SCSI card transfers information in Ultra2-LVD mode or single-ended mode.

In Ultra2-LVD mode, a chain of Ultra2 SCSI devices can transfer data at their fastest speed, 80 MB per second. However, if you connect a slower SCSI device to the chain, the channel defaults automatically to the slower single-ended mode.

In single-ended mode, a channel can support different data transfer rates from each device up to a top rate of 40 MB per second. For example, if you connect SCSI devices that have different transfer rates, each device transfers data at its own speed without affecting the transfer rate of other devices on the channel.

When you plan your chain of SCSI devices, take into account whether you want the chain to operate in Ultra2-LVD mode or single-ended mode. One channel can operate in Ultra2-LVD mode while the other operates in single-ended more. When connecting different SCSI devices to a channel that will operate in single-ended mode, connect Wide devices first (closest to the connector) followed by Narrow devices.

Make Sure Each Device In a Chain Has a Unique ID Number

Each SCSI device in a chain connected to your card must have its own unique ID number from 0 to 15 per channel. You can assign IDs from 0-6

and 8-15 to Wide SCSI devices. You can assign Narrow SCSI devices IDs from 0- 6. (The number 7 is assigned to the card.) The SCSI ID number helps the computer keep track of the devices when several devices in the SCSI chain are communicating with the computer simultaneously.

The SCSI devices can be in any physical order in the chain; it is not necessary to arrange them in numerical order. See the instructions that came with each SCSI device for information on checking and setting its SCSI ID number.

Important If two or more devices in a chain have the same ID number, your computer may not start up properly, your equipment may malfunction, and you may lose data as a result.

Use the Right Type and Length of Cable

To attach an external SCSI device to your computer or to another external device, always use SCSI cables that are double-shielded, such as Apple SCSI cables. Never use printer-type RS-232 cables. Poor-quality SCSI cables are often the cause of SCSI problems. Avoid mixing brands and types of SCSI cables.

Keep the cables between SCSI devices as short as possible. The maximum cable length that you can use depends on the types of devices in the chain. See the table below for information about maximum cable lengths:

SCSI device	**Maximum cable length**
Ultra2 LVD	12 meters (about 39 feet)
Ultra (or Ultra2 LVD devices in single-ended mode)	1.5 meters (about 5 feet)
SCSI-1, SCSI-2	3 meters (about 10 feet)

Terminate the SCSI Chain Properly

To ensure accurate transmission of information, a terminator must be present at each end of a SCSI chain. When you connect SCSI devices, make sure that only the last external device in the chain has a terminator. (There is already a terminator at the beginning of the SCSI chain inside your computer.)

The cable supplied for internal SCSI devices within your computer is already correctly terminated. The external cable is not terminated.

To terminate the last device in an external chain, do one of the following:

- Use a device that has a built-in terminator as the last device in the chain.
- If the device at the end of the SCSI chain does not have a built-in terminator, attach an external terminator. You can attach or remove external terminators yourself. Terminators are available at authorized Apple dealers.

Important Do not attach a terminator to a device that already has a built-in terminator. If you do, your computer may not start up properly.

Connecting an Internal SCSI Storage Device

To install an internal SCSI device, see the setup manual that came with your computer.

Connecting an External SCSI Device

To connect an external SCSI device to your card, follow the instructions below. Use these general instructions in conjunction with the more specific instructions that came with your external SCSI device.

1. Shut down your computer and make sure the SCSI device is switched off.

2. Use a SCSI cable to connect the device either to the card's external SCSI connector or to the last SCSI device already in the chain.

Use a SCSI cable that is compatible with the SCSI device. If you have a 68-pin connector on your external device, use the 68-pin VHDCI to 68-pin connector cable that came with your computer to connect the device to the card. Other cables or adapters may be required for SCSI devices with other types of connectors. For more information, see the documentation that came with the SCSI device.

Use the thumbscrews on the connectors to make a tight, reliable connection. Do not overtighten the thumbscrews.

3. Turn on all devices in your SCSI chain.

Important Always turn on all external SCSI devices connected to your computer before turning on the computer itself. Otherwise, your computer won't recognize that the SCSI devices are connected to it and your computer may not be able to start up.

4. Turn on your computer.

Icons appear for all SCSI devices connected.

Note: If you do not see an icon for a device, you may need to use drive formatting software, such as Drive Setup, to mount the device and make it available for use. Drivers installed by Apple's Drive Setup application may not be compatible with some devices.

5. Install any necessary device drivers (software that makes a device work with your computer).

Drivers needed for a SCSI device usually come on a disk or CD with the device. (If no drivers come with the device, contact the device's manufacturer.) Some older SCSI devices may require updated drivers to work with your computer.

Note: If you experience problems after connecting a SCSI device, see the troubleshooting documentation that came with your computer for possible solutions.

Technical Specifications

- Supports narrow and wide versions of Ultra-2, Ultra-1, Fast, and Standard SCSI devices
- Supports up to a total of 30 SCSI devices internally and externally (15 per channel, limited by the number of internal devices your computer is designed to house)
- Transfers data at up to 80 Megabytes per second (MB/sec) on each channel
- Supports SCSI Manager 4.3 compliant drivers only

Sending and receiving email enclosures or attachments

Learn about sending and receiving email message enclosures or attachments between two Macs, and between a Mac and a PC.
This article has been archived and is no longer updated by Apple.
An enclosure or attachment is a file on your computer's hard disk that you want to send to someone through email. This is a simple feature of most email application programs. There are considerations to be made depending upon whom you are sending the enclosure or attachment to. These considerations are explained below.

Tip: For best results, use Mac OS X 10.3 Panther's easy-to-use Mail application. It can easily send Windows-friendly attachments.

Why Send an Enclosure or Attachment?

The main reason to send an enclosure or attachment is to transfer a file that does not easily conform to a text email message, such as a database or spreadsheet file, or a word processing file that contains formatted text crucial to the comprehension of the file.

Sending Enclosures or Attachments to Another Macintosh

Usually the person who receives the attachment on their Mac will have no issues with it. But they might have an issue if the file only works with an application the recipient doesn't have. Check with the recipient before sending the email message to make sure she can open the attachment.

Sending Enclosures to a Windows-compatible PC

Sending enclosures or attachments from a Macintosh to a Windows-compatible computer is usually as simple as sending them to another Macintosh. You should make sure that the recipient has the same or a similar application program, and that it can read the file format of your program.

Applications that are available on both the Macintosh and Windows platform simplify the process since the file can be read on either platform. You might have to add the appropriate filename extension before attaching the file. See "Internet: Common File Formats" for a list of file extensions.

It is best to check with the recipient to determine if he has the same, or a compatible, application that you used to create the file.

Tip: Do you really need to send an attachment?

If all you are sending is unformatted text, type or paste the text directly into the email message itself. If the document you need to send contains tables or graphics that are not easily placed into an email message, then an enclosure is a better choice.

For Mac-to-PC emails, if the enclosure or attachment is text, it is best to save the document as ASCII or plain text. This ensures that the person receiving the email message can open it with a Windows-compatible word processor.

Tip: Keep enclosures small, or compress them

If you cannot avoid an enclosure or attachment, make the enclosure or attachment as small as possible. Not everyone is on a fast network.

If the file is large, you may be able to make it a little smaller. Compression utilities exist for both the Mac OS and Windows that allow compressed files to be sent between the two systems, such as Aladdin Systems' StuffIt. A file compressed with StuffIt will have .sit as the filename extension.

Mac OS X 10.3 Finder can compress, or archive, files. You can then use the archived (compressed) file as a Mail attachment.

If the person receiving your email message uses a Windows PC, ask if she can receive a large enclosure before sending it.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iMac: Downgrading Mac OS ROM Can Cause Start Up Failure

Installing iMac Update 1.0 places a downgraded version of the Mac OS ROM file on the iMac that is likely to cause the iMac to behave unpredictably or start up incorrectly.

iMac Update 1.0 was created to improve performance in iMacs with 233 and 266 MHz processors. It is not required, nor is it compatible with iMac 333 MHz and iMac (slot-loading) models.

This article provides a solution if the iMac Update 1.0 is accidentally installed.

This article has been archived and is no longer updated by Apple.
All iMac models have a file in the system folder called Mac OS ROM that contains information necessary for the proper start up of the computer. The version of the Mac OS ROM is matched to the individual iMac model and caution should be taken to avoid installing an earlier version of this file.

The iMac Update 1.0, which has been widely distributed on many third party software CDs for use on early iMac models, can be accidentally installed onto more recent iMac computers overwriting the more current Mac OS ROM file. This can cause the iMac to behave unpredictably or start up incorrectly, sometimes indicated by a blinking folder icon.

If you do install the iMac Update 1.0, you must replace the Mac OS ROM file with the version included with your computer, or a later version. To replace it with the proper version, do the following:

1. Start up from the Software Install CD that came with your computer (insert the CD and start up while holding down the C key).
2. Double-click the System Folder in the Software Install CD window.
3. Drag the Mac OS ROM file from the System Folder on the Software Install CD to the System Folder on your hard drive and click OK.
4. Restart your computer.

Note: The installer included with iMac updates later than version 1.0 perform a system check to prevent them from accidentally downgrading the Mac OS ROM file.

The Knowledge Base article 58174: "**iMac: When to Install Available Updaters**" has a complete list of the available updates and which ones should be installed on each iMac model.

iBook: Mold Lines Above Keyboard Are Normal

The iBook has visible mold lines just above the keyboard that might be mistaken as cracks in the plastic.

This article provides the location and description of these lines.

This article has been archived and is no longer updated by Apple.
Mold lines, which are also referred to as weld lines, occur during the normal manufacturing process of the iBook's plastic top case. The lines occur where molten plastic comes together within the mold. On the iBook, these lines are faintly visible on the top case above the keyboard.

These mold lines are normal and no repair of the iBook is necessary.

Figure 1 Mold lines

Because the mold lines are very faint, the locations where they may occur have been highlighted in red in Figure 1.

Differences Between the Mac OS ROM and bootROM

This article describes and differentiates the Mac OS ROM file and the Macintosh bootROM.
This article has been archived and is no longer updated by Apple.

Background

Historically, the Macintosh ROM (Read Only Memory) has been structured as one monolithic chunk of code residing on a physical chip on the logic board. It contained the routines needed by the computer at start up time (hardware knowledge, initialization, diagnostics, drivers, and such), as well as quite a bit of higher level Mac OS code.

While a computer needs to have a ROM with hardware-specific code in order to start up, the higher level code was also included in the Macintosh ROM because the Macintosh ROM had its genesis in the original 128K Macintosh computer back in 1983. At that time, ROM was cheaper than RAM, and the available disk space (which was floppy based) was at a premium. This is no longer the case.

The NewWorld architecture, introduced with the original iMac in 1998, separates the hardware-specific and higher level system software into two logically distinct pieces that are software based. Because the ROM information is now software based, it can be updated with software instead of requiring a hardware service.

bootROM vs. Mac OS ROM

In the NewWorld model, the bootROM holds most of the hardware-specific components needed to boot the specific logic board. Low-level hardware-specific code still exists in firmware (ROM) in order to handle the computer's start-up activities. This code fits into one physical ROM chip called the bootROM. The bootROM has the hardware-specific code and description of the hardware needed to start up the computer and provide common hardware access services the operating system might require.

The Mac OS ROM image file, present in the system folder, contains boot-time Mac OS routines and hardware-specific software components that are common to many Macintosh computers.

Both the bootROM and the Mac OS ROM can be updated, if need be, to provide enhanced functionality or to fix a known issue.

Determining whether to update your bootROM or Mac OS ROM

Before updating either the bootROM or the Mac OS ROM file, you should check the version you currently have installed. Apple System Profiler is the easiest method to determine the version of the Mac OS ROM and the bootROM. Simply click the triangle next to "Production information" under the System Profile tab. The information will look like this:

Look for the Boot ROM version and the Mac OS ROM file version and compare it with the update to ensure you are updating to a later version.

What about Open Firmware?

Open Firmware is the non-proprietary name of firmware complying with IEEE Standard 1275-1994. OpenBoot is Sun Microsystems trademark for the firmware product shipping on over one million SparcStations and SPARCServers since 1989.

Among Open Firmware's many features, it provides a machine independent device interface, which can be used to boot plug-in cards without providing OS-specific and/or machine dependent binary programs on the plug-in card. This feature enables plug-in card manufacturers to easily support several independent computer architectures without needing to supply different firmware for each one.

More information

Additional information on the Mac OS ROM, bootROM, and Open Firmware can be found on the Apple Developer Connection Web site at http://www.apple.com/developer. A search mechanism is available to assist you in finding the information you require.

Power Mac G4: Choosing Between Internal Modem Scripts

This article provides information to help decide which modem script to use for the Power Mac G4 internal modem.

This article has been archived and is no longer updated by Apple.
There are two scripts that were designed for this modem. The Apple Internal 56k (V.90) modem script is designed to achieve a maximum 56 Kbps (kilobits per second) connection utilizing the V.90 protocol. The Apple Internal 56K (V.34) modem script is designed to achieve a maximum 33.6 Kbps connection utilizing the V.34 protocol.

Under normal circumstances, the V.90 modem script should be selected because it enables the fastest modem connection. Be sure to contact your Internet Service Provider to ensure they are using V.90 compliant modems. If not, you should select the V.34 modem script.

If the modem does not connect, or the connection is dropped after a few minutes, the phone lines may have too much interference to sustain a connection at the higher speeds possible with the V.90 protocol. In this case, use the Apple Internal 56K (V.34) modem script, which directs the modem to connect at 33.6 Kbps or lower. This connection is more reliable in situations where the phone line quality is questionable.

To use the Apple Internal 56k (V.34) modem script, follow these steps:

1. Select the Modem control panel from the Apple menu.
2. Make sure the "Connect via" pop-up menu is set to Internal Modem.
3. Open the Modem pop-up menu and choose Apple Internal 56k (V.34).
4. If necessary, set the Sound and Dialing options.
5. Close the control panel. A message asks if you want to save the changes to the current configuration.
6. Click Save.

You do not have to restart your computer in order to use the new modem software.

Note: On the Power Mac G4 (PCI Graphics), the modem script names are Power Mac G3 Int 56K (v.34 Only) and Power Mac G3 Internal 56K.

For more information about troubleshooting unreliable modem connections, see article 24803: "**Troubleshooting Unreliable Modem Connections**".

PowerBook G3 Series: Battery Does Not Charge While in Use

The battery in a PowerBook G3 Series computer does not charge unless the PowerBook is in sleep mode or shut down. This article provides a workaround to this issue.
This article has been archived and is no longer updated by Apple.

Symptom

The battery does not charge when you're using the computer. It charges normally when the computer is in sleep mode or shut down.

Note: This issue only affects PowerBook G3 Series computers with a black keyboard. See article 24604 "**PowerBook G3 Computers: How to Identify Different Models**" for help identifying models.

Solution

There are several reasons why a battery may not charge when the computer is being used: the charging circuit hardware isn't working, the battery is no longer usable, or there is an issue with the AC adapter or wall outlet.

To help narrow down the possible cause, follow these steps:

1. Shut down the PowerBook
2. Connect it to AC power overnight and see if the battery is charged. If so, your PowerBook should be serviced. If it does not charge, try the next step.
3. Be sure the AC outlet is functional by plugging another electrical device into the wall outlet and turning it on.
4. If the outlet is working, try using a different AC adapter, if available, to charge the battery.
5. Download and install the PowerBook Battery Reset 2.0 from the Apple Software Updates Web site (http://www.apple.com/swupdates/).

Mac OS: Cannot Copy a File Because It Is in Use

This article explains how to workaround instances when the Finder cannot copy a file because the "file is currently in use."
This article has been archived and is no longer updated by Apple.

Symptom

While trying to copy a file from one disk or volume to another, an alert box appears with a message that the file cannot be copied or opened because it is currently in use.

Solution

The Finder normally cannot copy a file that is already open by another application, or is in use by the operating system. To copy the item, try the following:

- Quit all open applications and try copying the file again.
- If you are trying to copy a file from a file server to your computer, try reversing the process. Share your computer's hard disk, connect to it from the other computer or server, and copy the file to your computer. In some instances when you do this you may have to duplicate the file on the other computer or server before copying it to your computer.
- Share your computer's hard disk. Use a CD that has Mac OS 8.0 or later on it to start up the computer or server where the original file is saved. Connect to your computer from the other computer or server (which is started up using the CD). Try copying the file again. **Note**: Mac OS 8 and later provide basic network services when a used to start up a computer from a CD. This should allow you to connect to network volumes using the Chooser.

AirPort Card Not For Use in Standard PC Card Slot

Will a third-party wireless network PCMCIA (PC) card for my Macintosh PowerBook work in the AirPort slot inside a wireless capable Macintosh such as the iMac (Slot Loading), Power Mac G4 (AGP Graphics) or PowerBook (FireWire)? What about the opposite?

This article has been archived and is no longer updated by Apple.
No. There is an Apple AirPort Card designed specifically for Macintosh computers that support the AirPort wireless networking system. Refer to the printed materials that came with your computer to determine if it will support AirPort.

Conversely, you cannot use the Apple AirPort Card in the external PowerBook PCMCIA card slot.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Published Date: Feb 20, 2012

AirPort Base Station: Character Limit for User Name and Password

This article outlines the number and kind of characters that can be entered in the user name, password, and phone number fields in the AirPort Base Station setup assistant.
This article has been archived and is no longer updated by Apple.
The AirPort Base Station setup assistant allows up to 255 characters per field.

- User Name: 255 characters (letters or numbers)
- Password: 255 characters (letters or numbers)

The Main Number and Alternate Number fields allow up to 16 characters.

- Main Number: 16 characters (all numbers, plus: #*(),-)
- Alternate Number: 16 characters (all numbers, plus: #*(),-)

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"
Published Date: Feb 20, 2012

AirPort Base Station: Enter DNS Information During Setup

When configuring your AirPort Base Station, you must enter the Domain Name Server (DNS) information in the TCP/IP control panel, as shown in the graphic below.

This article has been archived and is no longer updated by Apple.
Typically, your Internet service provider (ISP) will supply you with the appropriate DNS information to enter during the setup process for the AirPort Base Station. If you do not enter the DNS information, you may not have full access to the Internet.

If you did not enter the DNS information while in the setup assistant, you need only open the TCP/IP control panel and enter it there and then run the AirPort Setup Assistant. Figure 1 shows an example of the PPP section of the TCP/IP control panel.

Figure 1. TCP/IP control panel

Note: This information can also be entered during setup of your Base Station using the AirPort Setup Assistant.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Published Date: Feb 20, 2012

AirPort Base Station (Graphite): LED Behavior

This article describes the Light Emitting Diode (LED) behavior of the AirPort Base Station (Graphite).

This article has been archived and is no longer updated by Apple.
The LEDs on the AirPort Base Station (Graphite) provide feedback and status through the use of color or blinking. The indications are unique depending upon what state the AirPort Base Station is in.

During Start-up

All LEDs amber (yellow or orange)	ROM Power On Self Test
Left LED red	Modem reset and power-up
Right LED amber (yellow or orange)	Ethernet interface test and driver start-up
Left LED amber (yellow or orange)	Wireless interface test and start-up
Right LED amber (yellow or orange)	Modem interface and driver start-up
All LEDs off	Kernel initialization and start-up
Middle LED green	Normal mode

While in Use

Middle LED	
Continuous green	Power on, normal mode
Continuous amber (yellow or orange)	Power on, forced reload mode or soft reload mode
Left LED	
Flashing green	Normal wireless traffic
Flashing red	Transmit or receive error on Base Station
Flashing Amber (yellow or orange)	Combination of error and correct frames in last 100 ms. (Continuous green means at least one frame per 100 ms)
Right LED	
	Same indication as left, but for Ethernet and modem

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.
Published Date: Feb 20, 2012

AirPort Base Station (Graphite): Factory Default Settings

This article provides the default settings for the AirPort Base Station (Graphite), as well as how to return a Base Station or AirPort Card to the factory defaults.

This article has been archived and is no longer updated by Apple.

For AirPort Base Stations using version 1.3 software

Base station defaults

- Base Station Name: AirPort Base Station xxxxxx (the x indicates the last six digits of wireless MAC address, found on the bottom of the Base Station)
- IP Address: 192.42.249.13
- Subnet Mask: 255.255.255.0
- Network Password: None
- Base Station Password: public

Port Configuration

- Ethernet: DHCP Port Config
- Wireless: DHCP & NAT
- Network Name: AirPort Network xxxxxx (where x is the last six digits of the MAC address, found on bottom of the Base Station)
- Channel Frequency: 1
- Encryption: Off
- Closed network: Off
- Station density: Low
- Multicast rate: 2
- Interference Robustness: Off

Note: The AirPort Base Station is set up properly out of the box (and after a forced reload) to work with a cable modem or DSL modem that obtains its IP information from a DHCP server. On the wireless side it is setup as a DHCP server with Network Address Translation (NAT) turned on and network encryption off. The default base station password is "public". So if you are trying to use the AirPort Base Station in a Windows environment, it may not be necessary for you to run the AirPort Setup Assistant. You need only plug in the Base Station and configure your Windows computer to access the Base Station.

Resetting the AirPort Base Station
Resetting the Base Station is documented in a Read Me file included with the AirPort software. You may also see technical document 58613, "**AirPort Base Station (Graphite): How to Reset**".

For AirPort Base Stations using version 1.2 and earlier software

Base station defaults

- Base Station Name: AirPort Base Station xxxxxx (the x indicates the last six digits of wireless MAC address, found on the bottom of the Base Station)
- IP Address: 192.42.249.13
- Subnet Mask: 255.255.255.0
- Network Password: None
- Base Station Password: public

Port Configuration

- Ethernet: DHCP Port Config
- Wireless: DHCP & NAT
- Network Name: AirPort Network xxxxxx (where x is the last six digits of the MAC address, found on bottom of the Base Station)
- Channel Frequency: 1
- Encryption: Off

Note: The AirPort Base Station is set up properly out of the box (and after a forced reload) to work with a cable modem or DSL modem that obtains its IP information from a DHCP server. On the wireless side it is setup as a DHCP server with Network Address Translation (NAT) turned on and network encryption off. The default base station password is "public". So if you are trying to use the AirPort Base Station in a Windows environment, it may not be necessary for you to run the AirPort Setup Assistant. You need only plug in the Base Station and configure

your Windows computer to access the Base Station.

Resetting the AirPort Base Station
Resetting the Base Station is documented in a Read Me file included with the AirPort software. You may also see technical document 58613, "**AirPort Base Station (Graphite): How to Reset**".

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Firmware Updates: Fully Depress the Interrupt Button

When you update your computer's firmware, the Interrupt (or Programmer's) button must be fully depressed or the update will not install.
This article has been archived and is no longer updated by Apple.
Firmware updates require that you press the Interrupt button, identified in Figure 1, while turning the computer on. Use a thin, blunt object such as a straightened paper clip or the tip of a pen.

Note: The Interrupt button on older iMacs is recessed so you will need to use a paper clip.

The Interrupt button is located on the front panel of the Power Macintosh G3 and Power Mac G4 computers, and on the right side of iMac computers. Refer to your Users Guide or Mac Help for the location of the Interrupt button on other computers.

Figure 1. Programmer's or Interrupt button

For specific firmware update installation instructions, please refer to the Read Me file that comes with the update.

Published Date: Feb 20, 2012

AirPort: What is Network Address Translation?

This article discusses Network Address Translation (NAT) and how it relates to the AirPort product family.

This article has been archived and is no longer updated by Apple.

Overview

Use of the Internet requires that your computer be identified with a unique address known as an Internet Protocol (IP) address. Unfortunately, there is a finite number of IP addresses available so Internet service providers (ISPs) typically assign only one IP address per subscriber.

Since many homes and small offices have multiple computers with access to the Internet, being limited to a single IP address can pose challenges. However, with NAT a small network of computers can share a single IP address to access the Internet.

The Apple AirPort Base Station provides NAT services to both AirPort-equipped clients and to clients connected to the AirPort Base Station via Ethernet.

IP Addresses

To understand NAT, it is not necessary to understand exactly how IP addresses are structured. However, it is important to understand that IP addresses are not random numbers.

Consider your street address. You cannot simply choose your street address. It is a number defined in relation to a numbering scheme used for your street, the street name, and zip code. All of these are part of a larger organizational system which makes it possible to locate your house.

Similarly, an IP address contains information that conforms to a larger organizational system. This system enables data intended for your computer to find your computer making communication on the Internet possible.

With regards to NAT, it is best to conceive of your home network and the Internet as two distinct environments. As the Network Address Translator, an AirPort Base Station serves as a mediator between these two environments. What makes your home network environment different from the Internet is that your home network does not need to conform to the large, complicated organizational structure of the Internet.

A device providing NAT service needs only one IP address to send and receive data from the Internet (like you have only one street address). The computers on your local network are assigned IP addresses; however the address are not communicated outside of your local network.

Ports

So if every computer on the local network communicates with the Internet using the same address, how does the AirPort Base Station determine where to send the different incoming messages? How does it know that an email for Computer A is not for Computer B or C?

NAT uses an aspect of Internet addressing called ports. Normally incoming data is sent not only to an individual IP address, but to a particular Application in use on that computer. So, Web browser packets go to your Web browser port and email packets go to your email port, and so forth.

As far as the Internet is concerned, your network is a single computer allowing you to use one IP address. Through the use of ports within NAT, email messages or Web pages are delivered to the proper computer and application.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Published Date: Feb 20, 2012

iBook: Wireless Antenna Placement When Not Used

This article provides information on ensuring the wireless antenna cable remains secured when not in use.
This article has been archived and is no longer updated by Apple.
If your iBook does not have the AirPort Card installed, the antenna cable needs to be secured to ensure it does not come in contact with the logic board. Such contact could damage the iBook logic board.

Refer to Figure 1 for placement of the antenna cable under the wire bracket.

Figure 1 Placement of AirPort Card Antenna Cable

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

PowerBook: Keyboard Does Not Recognize Multiple Keys Held Down

The built-in keyboard on PowerBook and iBook computers will not recognize more than two keys depressed simultaneously, with the exception of modifier keys. Some applications may require more than two keys be held down for certain functions.
This article has been archived and is no longer updated by Apple.
PowerBook computers have always had keyboards that will not recognize more than two keys held down simultaneously; otherwise known as two-key lockout. Modifier keys, such as the option, command, or control, are not affected by two-key lockout.

The Apple Extended Keyboard, Extended Keyboard II, and Apple USB keyboards do not have the two-key lockout. If you are using an application that requires you to hold down multiple keys, you can use one of these keyboards.

Published Date: Feb 20, 2012

AirPort Admin Utility: What To Do If It Cannot Locate a Base Station

This article provides troubleshooting tips for when the AirPort Admin Utility cannot locate any AirPort Base Station(s), and gives suggestions for accessing the AirPort Base Station if an error message is displayed.
This article has been archived and is no longer updated by Apple.
Use the following information if you cannot see an AirPort Base Station while using the AirPort Admin Utility 1.3 or later.

Before You Begin

Ensure you have power to the AirPort Base Station. If no lights come on when power is applied to the Base Station, verify the power adapter is plugged into a known good outlet. Try a different power adapter if available.

Part 1

1. After plugging in power and waiting one minute, verify the middle light on the Base Station is green.

2. In the AppleTalk control panel, set Connect via to AirPort.

3. Select the AirPort Base Station network in the AirPort portion of the Control Strip. (If only one Base Station is present its name appears below the Computer to Computer option.)

4. In the TCP/IP control panel, set Connect via to AirPort and Configure to Using DHCP Server.

5. Open the AirPort Admin Utility (in the AirPort folder inside the Apple Extras folder). You should see the AirPort Base Station name after scanning; if no Base Station appears and this computer has not been seeing wireless devices, make sure that the antenna is connected properly to the AirPort card. If you still do not see any Base Stations listed, continue on to part 2, step 5.

Part 2

1. Figure 1 shows the Select Base Station window in the AirPort Admin Utility. It lists any available AirPort Base Stations and the IP address associated with that Base Station. The screen shots and procedures that follow are helpful if you do not see a particular Base Station in the Select Base Station window.

Figure 1 Select Base Station Window in AirPort Admin Utility

2. Select the AirPort Base Station name and click Configure.

3. If the dialog box shown in Figure 2 appears, this indicates the AirPort Base Station was reset, or was never set up. You can bypass this dialog box by waiting 5 minutes after pressing the reset button on the AirPort Base Station itself, or by holding down the Option key when clicking the Configure button shown in Figure 1.

Figure 2 Set IP Address and Password Dialog Box

The Enter Password dialog box, shown in Figure 3, appears when you click Configure with the Option key held down, or when the Base Station has already been set up and you click Configure in the Select Base Station window.

Figure 3 Enter Password Dialog Box

4. Enter the password. If, after you select the base station and enter the password, you get the error message shown in Figure 4, verify the IP settings in the TCP/IP control panel. The settings should be as follows:

TCP/IP address - If you have an IP address, enter it here. Otherwise, use `192.42.249.13`.

Subnet mask - must be set to the same as the AirPort Base Station's subnet mask. If you do not know or did not change the AirPort Base Station subnet leave it blank. If blank does not work set it to `255.255.255.0`

Password - The default password is "`public`", and is case sensitive.

Figure 4 Error Message Window

5. Connecting to a Base Station through a wired connection.

If no Base Stations appear, as shown in Figure 5, you must have a direct connection to the Base Station from your Macintosh to perform a forced reload procedure. A direct connection is either an Ethernet crossover cable between the base station and Macintosh, or an Ethernet hub to which both devices are connected.

When using an Ethernet connection, change the TCP/IP control panel settings to:

Connect Via - Ethernet

Configure - Manually

IP address -`192.42.249.14`

Subnet mask - `255.255.255.0`

Figure 5 Select Base Station Window

Finally, perform a forced reload and your AirPort Base Station should be ready to be configured for use with the AirPort Admin Utility.

Note: A forced reload requires an Ethernet connection between the Base Station and the computer initiating the reload.

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

AirPort: Compatibility With Earlier Macintosh Products

Computers that do not have an AirPort card slot may join an AirPort network by using third-party wireless products or via Ethernet.
This article has been archived and is no longer updated by Apple.
Though AirPort cards are only for use with Apple computers that include an AirPort card slot, earlier PowerBook computers that have a free PCMCIA (PC) card slot may connect to an AirPort network with a third-party wireless card such as the Lucent WaveLAN, Agere ORiNOCO, or Farallon SkyLINE. For Mac OS 9, only 802.11b cards from some third-party vendors will be compatible. 802.11g or 802.11b/g cards will not work with the AirPort software included in OS 9. For more information about this topic, please see the document "Installation Instructions" included on the AirPort disk. For information on Mac OS X and wireless PC card compatibility see technical document 106205: "**Mac OS X, AirPort: Third-Party Wireless PC Cards Do Not Work With AirPort Client Software.**"

Figure 1 Location of Installation Instructions

Connecting to an AirPort Base Station without an AirPort card

Any computer that works with an IEEE 802.11 DSSS-compliant wireless interface card and its required software can connect to an AirPort Base Station. This applies to both Macintosh computers and those that use other operating systems. A computer connected with a third-party card can utilize TCP/IP-based services on the network, including Internet access where available. Computers without a PC card slot can utilize the AirPort Base Station as a router via Ethernet. See Note 1.

Using an AirPort Card
See the **Apple Spec Database** if you are unsure if your computer is compatible with the Apple AirPort card.

Using AirPort Admin Utility software

You may use the AirPort Admin Utility version 1.1 or later with any Macintosh computer that is connected to an AirPort Base Station either wirelessly or via Ethernet. If the software is not already on your computer, you may copy the Base Station Extras folder from the AirPort disc to the Macintosh from which you wish to use it. See Note 4.

Notes

1. If you are using a non-Apple 802.11 DSSS interface card, verify full AirPort compatibility with the vendor of the card.
2. The Indigo iMac (Summer 2000) computer with a 350 MHz microprocessor does not include an AirPort card slot.
3. The parenthetical product description (Summer 2000) refers to the summer of the Northern Hemisphere.
4. You do not have to use the AirPort Installer for the AirPort Admin Utility to work. In fact, the Installer does not work on some Macintosh computers. For related information, please see:

   Article 58584: "**AirPort: Configuring a Base Station With a non-AirPort-Capable Computer**"

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access.**"

Macintosh Server G4: Troubleshooting Checksum Error Message

This article offers troubleshooting advice for a checksum error message presented by the Macintosh Server G4 after performing a software restore.

This article has been archived and is no longer updated by Apple.

A checksum error can occur after running the Apple Software Restore (ASR) to restore an image (from CD) of Mac OS 9.0 or AppleShare IP 6.3 on to a SCSI drive that uses the SoftRAID v2.2 or v2.2.1 driver. Refer to Figure 1 for the complete error message text. The system does not crash or hang and a graceful exit is allowed.

Figure 1 Checksum Error Message Dialog Box

If you experience this error, it can be eliminated and the software restore allowed to complete successfully by following these steps:

1. Open the SoftRAID v2.2 or v2.2.1 application.
2. Select the drive to be restored to (**Note:** The SoftRAID application will automatically update the drivers on all SoftRAID controlled drives.)
3. Select Install Driver from the Disk menu.
4. Turn off Read Acceleration and Write Acceleration.
5. Close the window and quit the SoftRAID application.
6. Restart the computer to put the driver update into effect.
7. Retry the ASR; it should complete successfully.
8. Read Acceleration and Write Acceleration can be turned back on if desired.

iMac (Slot Loading): Buzzing Noise After Shutdown

This article describes a buzzing noise the iMac (Slot Loading) may make after shut down.
This article has been archived and is no longer updated by Apple.
A very small number of iMac (Slot Loading) computers may produce a buzzing or humming noise from the speakers after shut down. The noise can last for several minutes and will go away if the power cord is unplugged from the computer.

If your iMac (Slot Loading) makes a loud buzzing or humming noise after shut down, contact Apple or an Apple-authorized service provider for assistance in resolving this issue.

AirPort Base Station: Internet Application Timeout Error Discussion

I use an AirPort Base Station to establish a PPP connection to my Internet service provider (ISP) to view Web pages and check e-mail. The first time I attempt a connection each day I receive an error message from my Web browser. After I cancel the error message and retry the Web page, it loads fine. Why is this?

This article has been archived and is no longer updated by Apple.
When you first open an application that requires a connection to the Internet, your AirPort Base Station will start the connection process with your ISP by dialing the modem in the base station. The time it takes to make the connection is dependent upon the condition of your telephone line and the which ISP you are connecting to.

In certain cases you may notice that your first request for information is not successful resulting in the an error message from your Web browser indicating that a connection error occurred. This error appears because your Web browser tried to get information from the Internet before the AirPort Base Station finished the process of connecting to your ISP.

Wait until the AirPort Base Station has completed the process (right LED light has stopped blinking red or the AirPort application indicates that the base station is connected) and try to load another Web page.

The AirPort Base Station will stay connected to your ISP even though you may not be accessing the Internet. The default "Disconnect if Idle" setting is 600 seconds (10 minutes). This value can be changed using the AirPort Utility, however the default value is optimal for most situations.

Note: To verify the Base Station has made a connection to your ISP, look at the Status field within the AirPort application. It should say Connected or Active to indicate you are connected to your ISP. If you see a Connect button, as shown in Figure 1, click it to establish a connection.

Figure 1 AirPort Application window

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**."

Published Date: Feb 20, 2012

AirPort: Difference Between DSSS and FHSS

What's the difference between DSSS and FHSS?
This article has been archived and is no longer updated by Apple.
Direct Sequence Spread Spectrum (DSSS) and Frequency Hopping Spread Spectrum (FHSS) are two different technologies in the IEEE 802.11 specification. They are incompatible with each other.

Frequency Hopping technology is older and is limited by government regulation to 2 megabits per second.

Direct Sequence technology is becoming more widespread and supports data rates of up to 11 megabits per second. Apple uses DSSS technology because it is equivalent to Ethernet data rates.

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Published Date: Feb 20, 2012

Mac OS 9: Keychain Not Applicable to AirPort 1.0

The Mac OS 9 Keychain works with AirPort software versions 1.1 and later.

This article has been archived and is no longer updated by Apple.
You may not add log on information for an AirPort network to the Keychain when using AirPort 1.0 software.

Versions 1.1 and later of AirPort, however, work with Keychain.

Note: For AirPort versions 1.1 and 1.2, the Keychain is dependent on the IP address of a device for recognition and not its name. This means that an AirPort Base Station set up for a dynamically provided IP address is not recognized by the Keychain after its address changes. AirPort 1.3, however, resolves this limitation by allowing the Keychain to identify the AirPort Base Station by its hardware (MAC) address.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Published Date: Feb 20, 2012

AirPort 1.1: Base Station Extras Folder Contents

This article will discuss the contents of the folder Base Station Extras Folder on the AirPort CD.
This article has been archived and is no longer updated by Apple.
The Base Station Extras Folder contains the folder titled AirPort Admin Utility containing:

- Installation Instructions
- AirPort Admin Utility
- AirPort Admin Library

AirPort Base Station Software

The AirPort Base Station Software file is the software for the Base Station.

AirPort Admin Utility Folder

This folder contains the software and instructions on how one might configure an AirPort Base Station with a non-AirPort-Capable Computer.

For the contents of the Installation Instructions see article 58584: "**AirPort: Configuring a Base Station With a non-AirPort-Capable Computer**".

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Published Date: Feb 20, 2012

Power Mac G4 (AGP Graphics): Installing AirPort Card

This article provides instruction on the installation of the AirPort Wireless Networking card into a Power Mac G4 (AGP Graphics) computer. Similar instructions, with graphics, are included with the AirPort card.

This article has been archived and is no longer updated by Apple.

1. Shut down the computer (choose Shut Down from the Special menu) and unplug all cables except the power cord.

2. Touch the metal PCI access cover on the back of the computer to discharge static electricity. Avoid walking around until you have finished installing the card. Unplug the power cord then lift the latch on the side of the computer.

3. Gently lower the side panel onto a clean, flat surface. Lower it onto a soft cloth to avoid scratching the case.

4. Connect the antenna cable to the connector on the end of the AirPort card. The cable is usually stowed on the side of the PCI card guide.

5. Remove the metal clip and pull the AirPort card from the adapter card, shown below. The adapter card and clip are not used with your Power Mac G4.

6. Insert the AirPort card (serial number side up) through the opening in the PCI card guide, and into the connector on the main logic board as shown below.

7. Raise the side panel and press it against the case until it snaps into place.

Instructions for using the AirPort software are in Mac Help, available in the Help menu.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

AirPort Base Station: Troubleshooting a Dial-up Connection

This document discusses troubleshooting a dial-up connection with an AirPort Base Station.
This article has been archived and is no longer updated by Apple.
This information has been relocated to technical document 106858, "**AirPort: Troubleshooting Outline**".

This document contains steps for both Mac OS 9 and Mac OS X.

Published Date: Feb 20, 2012

AirPort Base Station: X2 Modem Compatibility

An AirPort Base station may connect to an X2 modem, but the connection speed varies depending on circumstances.
This article has been archived and is no longer updated by Apple.
Your Internet service provider may use either X2 or K56 Flex modems to provide access to the Internet. Your AirPort Base Station connects to either modem type. However, you can only get the maximum connection speed when those modems have been updated to the V.90 protocol.

The modem in the AirPort Base Station, like those of in iMac and PowerBook computers, is K56 Flex V.90 compliant. It connects to an X2 type modem whether or not the X2 modem is V.90 compliant.

If the X2 modem has been updated to the V.90 specification, connection speeds should approach the FCC-authorized maximum of 53 Kbps. But when an X2 modem is not updated to V.90, connection speeds are typically 33.6 kilobits per second (Kbps) or slower.

For additional information on the V.90 specification, please see:

Article 30734: "**V.90 Protocol: Connectivity Discussion**"

Additional Information

Immediately after a modem answers a call from another modem, the modems negotiate at what speed they will communicate. Typically each modem will attempt to communicate using a preferred standard at the highest speed possible. For the base station modem that is V.90 at 53 Kbps.

When the other modem does not support a particular protocol standard the modems begin slowing down until a mutually acceptable protocol is found. If V.90 is not available, the base station tries K56 Flex. The next protocol it would try is V.34.

To force the modem in the AirPort base station to begin connection negotiation at V.34 follow these steps:

1. Open the AirPort Admin Utility.
2. Click the Internet tab.
3. Choose Modem (V.34) from the Connect pop-up menu.
4. Click Update.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"

Apple Studio Display DVI: Plug In Power Cord First

This article clarifies information provided in the Users Guide as to why it is important to plug in the computer power cord before connecting the video cable of the Apple Studio Display DVI and Apple Cinema Display.
This article has been archived and is no longer updated by Apple.
The Apple Studio Display DVI and Cinema Display can be damaged by electro-static discharge (ESD), particularly when the data cable is connected to the computer. To prevent possible damage, the Power Mac G4 (AGP Graphics) must be plugged into a grounded power outlet before connecting the Studio or Cinema Display.

Once the computer is plugged into the power outlet, you may connect the display to the computer.

Final Cut Pro: QuickTime Pro Registration

Learn where to enter the QuickTime Pro registration information in Final Cut Pro versions 1.2 or later.
This article has been archived and is no longer updated by Apple.

Final Cut Pro 2.0 to 5.0 and Final Cut Pro HD 4.5

To register the version of QuickTime Pro that comes with these versions of Final Cut Pro, Type "QuickTime Pro" in the "Register To" field and type the serial number included on the sheet in the appropriate field.

Final Cut Pro 1.2

To register the version of QuickTime 4 Pro that comes with Final Cut Pro 1.2, type "QuickTime 4 Pro" in the "Registered to" field. Then enter the serial number included on the sheet in the appropriate field within QuickTime 4 Pro and continue.

Important: Do not enter anything into the Organization field.

Verification of QuickTime Pro registration

Mac OS X

1. Open System Preferences.
2. Choose QuickTime from the View menu.
3. Click Registration. The registration information appears.

If the registration information was entered properly, the QuickTime field states "5.0 Pro Player Edition", "6.0 Pro Player Edition", or "QuickTime 7 Pro."

Mac OS 9

1. Open the QuickTime Settings control panel.
2. Select Registration from the pop-up menu. The registration information appears.

If the registration was entered properly, the QuickTime Key states "5.0 Pro Player Edition" **or** "6.0 Pro Player Edition"

Published Date: Feb 20, 2012

Open Transport Tuner 1.0: Description

This article describes Open Transport Tuner 1.0.

IMPORTANT: This update has been superceded by Open Transport 2.6. If you have installed the Open Transport Tuner 1.0, please download and install Open Transport 2.6 from the Apple Software Updates Web site at http://www.apple.com/swupdates.

This article has been archived and is no longer updated by Apple.
OT Tuner 1.0 switches off an option in Open Transport that would cause a Macintosh to respond to certain small network packets with a large Internet Control Message Protocol (ICMP) packet. This update prevents Macintosh computers from being used in certain types of Denial of Service (DoS) attacks.

This update will only function on computers running Open Transport 2.5.x. This includes all computers running Mac OS 9, as well as iBook, Slot-Loading iMac, and most Power Macintosh G4 computers running Mac OS 8.6.

Apple has identified certain issues that may occur after installing the Open Transport Tuner 1.0. These include:

- After installing the Tuner, if you make changes in the TCP/IP control panel, you must restart to use TCP services.
- In some circumstances, internet connections (such as DSL or cable modem) that can be maintained through sleep/wake cycles may not be maintained after installing the Tuner.

To resolve these issues and to take advantage of other improvements, Apple recommends that all Open Transport 2.5.x users update to Open Transport 2.6. This update can be downloaded from the Apple Software Updates web site at http://www.apple.com/swupdates. For more information on Open Transport 2.6, please see Knowledge Base article 32075: "**Open Transport 2.6: What's New**".

ATI Rage 128 Pro Video Card: VGA Signals Through DVI Port

The ATI Rage 128 Pro video card installed in the Power Mac G4 (AGP Graphics) does not provide VGA signals through the Digital Visual Interface (DVI) port.
This article has been archived and is no longer updated by Apple.
The ATI Rage 128 Pro AGP video card provides a DVI and VGA video connector. The DVI connector follows the DVI-D standard and supports only digital displays. Customers needing to connect standard VGA displays can use the 15 pin VGA connector.

The DVI standard allows manufacturers to incorporate VGA signals into the DVI port. This variation of DVI is called DVI-I. The DVI-D and DVI-I connectors appear identical except for a single connector 'key'. The key on DVI-I connectors forms a plus (+) sign, while on DVI-D connectors it forms a minus (-) sign.

The ATI Rage 128 Pro card supports one display at a time. The DVI and VGA ports cannot be used simultaneously.

Mac OS X Server: Starting and Stopping AFP services

This article tells how to start and stop Mac OS X Server AFP services, and how to send a custom notification message to users.

This article has been archived and is no longer updated by Apple.
You can start and stop the AFP server from the Web-based administration feature. If you use Web admin to stop the AFP server, you can specify a period of time for the server to wait before shutting down. You can also enter a custom message that the clients see. Consult the documentation that came with Mac OS X Server for more information on how to use the Web administration feature.

If you stop the AFP server from within the Macintosh Manager admin application (in the Server tab), the connected users receive a generic AppleShare message that the server has gone down.

Published Date: Feb 20, 2012

Disk Copy: Using with USB Drives

I have a USB floppy drive and when I try to use the "Make A Floppy" command in Disk Copy, it is dimmed. Is it possible to use Disk Copy with a USB floppy drive?
This article has been archived and is no longer updated by Apple.
You can create floppy disks from disk images using a USB floppy drive if you:

- Use disk copy 6.3.1 or higher.
- Insert a floppy in the USB drive before you choose the Make A Floppy command.

Note: You may need to install the latest driver for your USB floppy drive for it to work with this function of Disk Copy.

Once you have inserted a floppy into the drive, Disk Copy will recognize that the drive supports floppy disks and the Make A Floppy command will become available in the Utilities menu.

For more information about Disk Copy, see article 60353: "**Disk Copy 6.3.3: Quick Reference**".

Mac OS 9 and Language Kits: Setting Sherlock 2 to Show Foreign Characters

When using Mac OS 9 with custom installed Japanese language support, Sherlock 2 search results for Japanese files or Web sites contains unreadable garbage text. This article explains how to get this list to properly display Japanese characters.
This article has been archived and is no longer updated by Apple.
Sherlock 2 uses the Views font set in the Finder to determine which foreign characters to display in the Items Found field.

To change the Views font, do the following:

1. Open the Appearance Control Panel, select the Fonts tab.

2. In the Views Font pop-up menu, choose one of the fonts installed by the Language Kit. For the Japanese Language Kit, change the font to Osaka.

The fonts included with each Language Kit are designed to support English characters and each Kit's specific language only. The Language Kits do not currently support viewing multiple languages (for example, Japanese and Korean) simultaneously with the same font.

If you have installed multiple language kits with Mac OS 9 and use Sherlock 2 to search for items with foreign names, change the Views font to correspond with the appropriate language.

Published Date: Feb 20, 2012

Using AirPort wireless communication internationally

This article has been archived and is no longer updated by Apple.

Regulations for wireless communication vary between countries, so an AirPort card or Base Station is only certified for use in the country in which it was originally sold. In the case of the base station, both the modem and wireless card must be individually certified for use in the various countries.

AirPort operates in the the 2.4 and 5.0 Ghz bands, which are internationally recognized band for radio LANs. However, regulations in certain countries do not allow the use of all available channels, so you should only use the permitted channels within a given country. The following chart describes the channel regulations for the 2.4 Ghz band.

Country/Continent	Permitted channels
North America	1 to 11
South America	1 to 11
Europe	1 to 13
Asia/Pacific (except Japan, Taiwan)	1 to 13
Japan	1 to 14
Taiwan	1 to 11

When traveling, beware that your AirPort product may be able to operate on channels that are not available in the country that you are visiting. For example: If you bought your AirPort card in Japan and traveled to North America, you should not use your computer to create a network on channels 12 to 14, because your North American colleagues would not be able to see your network (cards purchased in North America only work on channels 1 to 11). When creating a computer-to-computer network, select a channel by simply changing the Channel menu from Automatic (shown below) to another number.

Conversely, if you frequently travel to a region that allows more channels than your home region, you may want to consider purchasing an external wireless adapter from the region in which you are using the device.

Administrators of 2.4 Ghz wireless networks that frequently host foreign visitors should consider limiting their networks to channels 1 through 11, which are common to all AirPort products. You can change the channel of a base station using AirPort Admin Utility. Just click the AirPort tab, then use the Channel menu.

An AirPort client joining a network will see the network regardless of channel, so long as it's on one of the channels allowed by the country in which the client AirPort card was purchased. When a network does not appear to the client, it may indicate that the network is on a channel not supported by the client card (such as a North American AirPort card attempting to join a channel 14 network in Japan). It may also just be a "closed" network that you could join by choosing Other and typing the network name.

Note: You are responsible for complying with local regulations when using an AirPort product outside the country in which the device was purchased.

Important: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some Internet service providers are not compatible with AirPort. Read more about AirPort requirements for wireless Internet access.

Published Date: Feb 20, 2012

AirPort: Use the Same Software Version on All AirPort Devices

For best performance, you should use the latest version of AirPort software on all AirPort-equipped computers and AirPort Base Stations.
This article has been archived and is no longer updated by Apple.

Symptom

- Some computers on an AirPort network connect normally, while others do not detect the AirPort network at all.
- A computer with AirPort 1.3 may not be able to connect to a Computer-to-Computer network created by a computer using AirPort 1.2.
- Other unexpected connection behaviors may occur.

Solution

For best performance, you should be sure that all AirPort-equipped computers and AirPort Base Stations have:

- the latest version of the AirPort software installed
- the same version of the software installed

Mixing different versions of AirPort software among the computers or base stations on your network may cause unexpected results. For example, an AirPort 1.1 client using the AirPort Setup Assistant cannot detect a Base Station using a later version of the AirPort software.

You can download the latest version of AirPort software at Apple Software Updates (http://www.apple.com/swupdates/).

Note: As a workaround in the Computer-to-Computer example, you may start the network with a computer using AirPort 1.3 and then have computers using AirPort 1.2 join.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access"**

Published Date: Feb 20, 2012

AirPort 1.2 and Earlier: Using Computer to Computer Mode

This article discusses the use of Computer-to-Computer mode on AirPort-equipped computers with AirPort software versions 1.2 and earlier. This article has been archived and is no longer updated by Apple.
You may download a later version of AirPort software at Apple Software Updates (http://www.apple.com/swupdates/). This article is provided for customers who do not wish to update their software immediately.

Computer-to-Computer mode allows you to quickly create a small network between two AirPort- equipped computers or IEEE 802.11 compliant devices. This small network does not require an AirPort Base Station. It is theoretically possible to have more than two devices on a Computer-to-Computer network, but you should use an AirPort Base Station or Software Base Station if you are having difficulties.

Note: A preview version of the Software Base Station became available in the 1.1 version of the AirPort software.

AirPort versions 1.2 and earlier use channel 3 exclusively when in Computer-to-Computer mode. This is not adjustable.

If you are using a third-party IEEE 802.11 wireless device, it may have the ability to use a different channel frequency when in Computer-to -Computer mode. Ensure your third party device is set to channel 3 when setting up a Computer -to-Computer network with an AirPort equipped computer.

In Computer-to-Computer mode, the signal strength meter in the AirPort portion of the Control Strip will always show three green dots.

If you are unable to use AirPort to access another AirPort-equipped computer, make sure that:

- The TCP/IP and AppleTalk control panels on both your computer and the one to which you are trying to connect are set to use AirPort.
- You select Computer-to-Computer in either the AirPort application or the AirPort portion of the Control Strip.
- The two computers are within range of each other. (The typical range for an AirPort connection is up to 50 m.) Try moving the two computers closer together.
- There are no sources of interference, such as a microwave oven or 2.4 GHz cordless phone in range of the Base Station. (A list of interference sources is available in Mac Help.)
- File sharing is turned on in the File Sharing control panel (on both your computer and the one you are trying to connect to). If file sharing is turned off, you will be unable to see the other computer in the Chooser or Network Browser.

Note: While in Computer to Computer mode, you will be broadcasting without encryption (no network password). Therefore, the security of your computer is dependent upon the File Sharing privileges. If you have Guest access turned on, anyone with an AirPort equipped computer in a 50 m range could connect to your computer.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access"**

Published Date: Feb 20, 2012

AirPort 1.x: Disabling Software Base Station

This article describes how to disable the AirPort Software Base Station feature included AirPort versions 1.1 and later under Mac OS 9.
This article has been archived and is no longer updated by Apple.
There are two extensions that support the AirPort Software Base Station:

- AirPort AP Support
- AirPort AP

To disable the AirPort Software Base Station, you must remove the AirPort AP extension or turn it off using the Extensions Manager control panel.

If the Start button is clicked in the AirPort application after the extension is removed, the following message will appear indicating the software Base Station could not be started:

"Software Base Station could not be turned on because the required AirPort software was not found on this computer. Reinstall the AirPort software and try again."

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.
Published Date: Feb 20, 2012

AirPort: Turning On Access Control

You can use the MAC Access Control Table in the AirPort Admin Utility to provide additional security for an AirPort Base Station.
This article has been archived and is no longer updated by Apple.
Once you enter the first MAC address, Access Control becomes activated, there is no on/off switch. If you do not enter anything here, all clients will be permitted access. The number of addresses that you can add varies depending on which base station you have. By model:

- AirPort Base Station (Graphite): 497
- AirPort Base Station (Dual Ethernet): 300
- AirPort Extreme Base Station: 500
- AirPort Express: 25

Note: When you enter information in the description field, this decreases the total number of possible entries. For example, this may decrease to as low as 150 on the AirPort Base Station (Dual Ethernet).

To set up Mac Access Control follow the steps below:

1. In the Access Control tab for the base station, click Add as shown in Figure 1.

Figure 1 Access Control Tab

Note: The window shown in Figure 3 states that "Access to the AirPort network will be restricted to the clients listed here. If nothing is listed, all clients are permitted upon correctly entering the password." This assumes that WEP encryption has been enabled. If it has not, then no password will be required.

2. The Add Client window opens and prompts you for the AirPort ID and Description. Click OK after entering the appropriate information.

The Description entry is optional. However, if you don't enter one, the Access Control table only lists the numeric AirPort ID which makes it extremely difficult to associate it with a particular Client.

The AirPort ID is the same as the MAC Address. The MAC Address can be found on the AirPort card under the serial number. If you already have the card installed in your computer, use Apple System Profiler or the AirPort application to obtain the Mac (hardware) Address.

Figure 2 AirPort Card Showing AirPort ID

Figure 3 Apple System Profiler Window

3. The Access Control Table shows the AirPort ID and Description entered in the previous step.

4. You can enter additional clients to the table by clicking Add and providing the required information. A more complete Access Control Table with five entries is shown in Figure 4.

Figure 4 Access Control Tab

This particular AirPort Base Station (Ebbetts Field) only permits access to the network(s) (Ethernet, DSL, ISP, or cable modem) connected to the base station by the five Clients listed. In this example, the correct network password is also required.

Should an unauthorized client learn the password for this wireless network, they would still be able to associate with the base station and communicate with its associated Clients. However, because their AirPort ID is not in the Access Control Table, they would not be able to access the Ethernet network or dial-out through the Base Station.

Note: For AirPort Base Stations (Graphite) only, even with Access Control on, a client whose MAC address is not entered into the table can still use the control strip to select the network. The client can connect to the Base Station, but not access the Ethernet network or the analog connection. (The LED indicators show up in the control strip and the name gets a bullet next to it in list.)

For wireless clients not in the Access Control Table, file sharing access will still be available via TCP/IP and AppleTalk. Access Control offers

little protection to the wireless clients that are not following normal security procedures.

5. When you finish making entries to the Access Control table, click Update to save the changes.

6. After clicking Update, the Base Station must be reset to complete the update. Click OK when the following window appears:

Figure 5 Base Station Reset Dialog Box

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Optimizing reception of your AirPort Base Station

To optimize reception between a base station and an AirPort-capable computer, you may need to adjust the placement of the base station or computer.
This article has been archived and is no longer updated by Apple.

1. Check the location of the AirPort Base Station. Place the base station in a good, clear, central location, where there is little or no interference.
2. In some environments, rotating or changing the orientation of the base station or computer can affect reception.
3. In Mac OS 9, use the Optimize Placement feature in the AirPort Admin Utility to verify that you have good reception in the locations you wish to use the system. If reception is not optimal, move or change the orientation of the base station or computer until you get an acceptable signal.
4. Use the AirPort Admin Utility to change the channel on the AirPort Base Station.
5. For more information on optimizing the placement of one or more AirPort Base Stations, refer to the "Designing AirPort Networks document." The AirPort Installer may have saved this document on your hard disk. It is also available from Apple Downloads.

Important: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some Internet service providers are not compatible with AirPort. Read more about AirPort requirements for wireless Internet access.
Published Date: Feb 20, 2012

AirPort for Mac OS 9: Third-Party Wireless Software and Equivalent Network Password

Some third-party wireless networking software may not utilize the standard AirPort password. This article describes what to do if your software does not recognize the password.
This article has been archived and is no longer updated by Apple.
This document covers AirPort when used with Mac OS 9. When using Mac OS X, see technical document 106864, "**AirPort for Mac OS X: Third-Party Wireless Software and Equivalent Network Password**".

Symptom

You are unable to connect to an AirPort Base Station using the standard AirPort password when you use third-party (non-Apple) wireless networking software.

Solution

If you are using a computer with non-Apple wireless software, you may be able to connect to the AirPort Base Station and use it for Internet access. However, the network password you enter may be different from the one an AirPort user would enter.
First try the standard password to see if it works. If it does not then you will want to try the equivalent network password. To find the equivalent network password for your AirPort Base Station, do the following:

1. Open the AirPort Admin Utility.
2. Select your base station from the list.
3. Click Configure.
4. When prompted, enter the password for your base station.
5. Choose Equivalent Network Password from the base station menu. A window appears with the network equivalent password for your base station.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"
Published Date: Feb 20, 2012

AirPort Base Station (Graphite): How to Set Up Wired Clients

This article describes how to use wired Ethernet computers, in addition to AirPort-equipped computers, with the original AirPort Base Station (Graphite). This document includes configurations that require an additional Ethernet hub, as when using a cable or DSL modem.
This article has been archived and is no longer updated by Apple.
Note: This document discusses the original AirPort Base Station (Graphite). For configuration of later AirPort base station models ("Dual Ethernet" and "Extreme"), see these documents instead:

52002: "**Designing AirPort Extreme Networks : Manuals**"
120146: "**Designing AirPort Networks for Mac OS X (v10.2): Manuals**"
120061: "**Designing AirPort Networks for Mac OS X (v10.1) Manuals**"

There are a couple of ways you can connect a Macintosh with Ethernet, such as a Power Macintosh G3, to the Base Station to obtain Internet services via cable modem, DSL, or PPP.

If you are only sharing the Internet connection with wireless clients, you can connect the Base Station directly to your cable or DSL modem. If you are sharing the Internet connection with both wireless and Ethernet clients, an Ethernet hub will be required to connect non-AirPort capable computers to the Base Station.

Cable or DSL Connection Using DHCP

This setup assumes that you have successfully connected to the Base Station and the Internet from an AirPort capable computer such as an iBook. To add the Power Macintosh G3, set its TCP/IP control panel to use Network Address Translation (NAT) provided by the Base Station.

1. Open AirPort Admin Utility.
2. Select your base station from the list, and click Configure.
3. Click the Network tab. (With AirPort 3.0 or later, you must click the Show All Settings button to access the Network tab.)
4. Select the checkbox for "Ethernet client computers also share a single IP address (using NAT)."

Warning: When connecting a wired client to your AirPort Base Station (Graphite) to share cable Internet service, it is strongly recommended that you NOT allow the Base Station to provide IP addresses over Ethernet.

Connect your cable or DSL modem to the Ethernet hub. Then connect any computers to the hub that will use NAT services from the Base Station. To setup your wired computers, you need only:

- set the TCP/IP control panel to an IP address outside the range that it is being served wirelessly by the Base Station
- not set your wired computers to DHCP

On the Power Macintosh G3, enter10.0.1.201 in the IP address field within the TCP/IP control panel . Set additional computers to the next number, 10.0.1.202, up to 10.0.1.254. Enter the subnet address, 255.255.255.0 and router address, 10.0.1.1. The domain name server (DNS) IP address and the domain names should be the same as those used for your ISP. The TCP/IP control panel should appear as in Figure 1.

Figure 1: TCP/IP Control Panel Setup for Cable Modem

You could set up the Base Station so that it provides IP addresses on Ethernet, but this could cause trouble. Both your service provider's DHCP server and the Base Station would be attempting to provide IP addresses to any computers connected by Ethernet. This would cause conflicts and result in unreliable connections for both the wired and wireless computers. This could potentially disable all Internet traffic through your cable or DSL modem until the modem is reset.

Using a Static IP Address via Cable or DSL

If the cable ISP provided a static IP address for your connection, it is still appropriate to use the same setup as described above. While the AirPort Admin Utility software allows you to set up the Base Station to provide DCHP addresses over Ethernet, your Base Station could respond to DHCP requests from the Internet and create unwanted Internet traffic. This is not desirable to you or your ISP.

Note: This is unlikely to be an issue with DSL.

Dial-up PPP Connection

The setup described for cable or DSL modems should work with dial-up connections. No changes need to be made to the Base Station. Use the TCP/IP control panel on your wired computer to define the connection. In the TCP/IP control panel on the computer using Ethernet, enter an IP

address of 10.0.1.201. Additional computers would be set to the next number 10.0.1.202, an so forth, up to 10.0.1.254. Enter the subnet address of 255.255.255.0 and a router address of 10.0.1.1. The DNS IP addresses and the domain names should be the same as those used for your ISP. The TCP/IP control panel should appear as in Figure 2:

Figure 2: TCP/IP Control Panel Setup for PPP Connection

Note: The warning about providing IP addresses over Ethernet from the Base Station does not apply to PPP connections. If need be, you can set up the Base Station to provide IP addresses over the Ethernet for your wired client computers.

In the TCP/IP control panel for the wired computers, set them to "Connect via Ethernet" and "Configure Using DHCP Server."

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Published Date: Feb 20, 2012

AirPort 1.2: Updating Base Station Firmware

This article provides the necessary steps to update the firmware in an AirPort Base Station after updating to AirPort 1.2.
This article has been archived and is no longer updated by Apple.
Before beginning, make sure you are not connected to the Internet since the Base Station will be restated after the update has been performed.

1. Install the AirPort 1.2 software and restart the computer.

2. If you have installed AirPort on the computer for the first time, the AirPort Setup Assistant will launch automatically after you restart your computer. When it does, quit the AirPort Setup Assistant. The dialog box in Figure 1 will appear if you try to use the Setup Assistant before updating the Base Station.

Figure 1: AirPort Setup Assistant Dialog Box

3. Select AirPort network in the AirPort control strip portion or AirPort application.

4. Verify the TCP/IP control panel is set to AirPort and using DHCP.

5. Launch the AirPort Utility

6. Select the Base Station to be updated and click Configure (if it is a new Base Station, select Other and type in 10.0.1.1 and "public" for password).

Note: Although updating the Base Station software does not erase any settings, we recommend that you save your existing Base Station settings before uploading new software as a precaution. To do this, select Save As under the File menu.

7. In the Base Station menu, choose Upload Default Software and then click OK.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access"**

Published Date: Feb 20, 2012

AirPort: How to Use AirPort Setup Assistant

First you set up your computer to connect to the Internet, then AirPort Setup Assistant transfers the settings to an AirPort Base Station. More complex configurations are possible using the AirPort Admin Utility and the Designing AirPort Networks document.
This article has been archived and is no longer updated by Apple.
Before using the AirPort Setup Assistant, you should set up your computer for Internet access as if the base station were not present. Once you have set up the computer for Internet access, locate the AirPort Setup Assistant. The setup assistant transfers the settings you have just made to the base station.

I. Steps for Mac OS 9
II. Steps for Mac OS X
III. Complex networks

Steps to take in Mac OS 9

Note: If your computer is already successfully connecting to the Internet, skip to Step 3.

1. Locate the Internet Setup Assistant. You can locate it using Sherlock, which is accessible from the Apple menu.
2. Open the Internet Setup Assistant, and follow the prompts to complete it.
3. Locate the AirPort Setup Assistant, using Sherlock if needed.
4. Open the AirPort Setup Assistant and follow the prompts to set up the base station.

Optional: You may be able to open the Internet Setup Assistant through a feature in the AirPort Setup Assistant. The dialog shown in Figure 1 will only appear if you respond that your computer is not set up for Internet access.

Figure 1 AirPort Setup Assistant dialog box in Mac OS 9

If you choose this option, the AirPort Setup Assistant will quit, and the Internet Setup Assistant will open. Upon completing the Internet Setup Assistant, you will be returned to the Finder. You must then re-open the AirPort Setup Assistant.

Steps to take in Mac OS X

Note: If your computer is already successfully connecting to the Internet, skip to Step 4. If you have created more than one location, be sure that the settings you want transferred to the base station are the active location.

1. Choose System Preferences from the Apple menu.
2. Choose Network from the view menu.
3. Enter the settings for connecting to your Internet service provider. For help completing this step, see technical document 106796, "**Mac OS X: Internet and Network Topics (Getting Connected, Troubleshooting)**".
4. Locate the AirPort Setup Assistant. You may use Sherlock, located in your Applications folder, to find it.
5. Open the AirPort Setup Assistant and follow the prompts to set up the base station.

Complex networks

For a more complex network configuration that would not be applicable to a standalone computer, you may configure the base station directly using the AirPort Admin Utility. For more information on setting up such a network, see software download documents:

120061: "**Designing AirPort Networks for Mac OS X (v10.1) Manuals**"
75138: "**Designing AirPort Networks for Mac OS 9 Document**"

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**"
Published Date: Feb 20, 2012

PowerBook (FireWire): AirPort Card Installation

This article provides information about installing an AirPort card into a PowerBook (FireWire).
This article has been archived and is no longer updated by Apple.

1. Shut down your computer, remove the battery from the expansion bay, and disconnect the power adapter, modem, and any other cables connected to the computer.
2. Make sure that the keyboard locking screw, located between the F4 and F5 keys, is not in the locked position. Your new PowerBook comes with the keyboard unlocked, so unless you or someone else locked the keyboard, you can skip this step. If it is locked, turn the screw one half turn in either direction so that the screw slot is oriented horizontally.

   Warning: The internal components of your PowerBook may be hot. If you have been using your PowerBook, wait 30 minutes after shutting down your computer to let the internal components cool down before continuing.
3. Release the keyboard by pulling down on the keyboard release tabs (located to the left of the F1 and F9 keys) until the top portion of the keyboard pops up.
4. Lift the top portion of the PowerBook keyboard up slightly near the top row of keys and pull it back far enough to displace the small tabs that hold the bottom of the keyboard in place.
5. Flip the keyboard over and lay it on the palm rests and trackpad.
6. If your AirPort Card came with the AirPort adapter, remove the metal clip and pull the AirPort Card from the adapter. (The adapter and metal clip are not used with your PowerBook.)
7. Touch a metal surface inside the computer to discharge any static electricity.
8. With a Phillips screwdriver, remove the screws that secure the internal heat shield.
9. Lift up the internal heat shield.
10. Position the AirPort Card with the AirPort ID numbers and bar code facing up and connect the AirPort Card to the end of the antenna cable. Make sure that the connector on the end of the antenna cable is straight before inserting it into the card.
11. Slide the card into the connector located just above the PC Card slot. Make sure to slide the card all the way in until you feel that the card is securely attached to the connector. **Note:** When inserting the AirPort Card, you may need to tuck the end of the card under the plastic wall. This helps align the card with the connector and prevents the back end of the card from sticking up after it has been inserted.
12. Insert the internal heat shield.
13. Insert the small metal tabs at the base of the keyboard. Important When replacing the internal heat shield, make sure it does not cover the plastic tabs for the hard disk and AirPort Card. The plastic tab for the processor module should be placed under the heat shield.

Important: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some Internet service providers are not compatible with AirPort. Read more about AirPort requirements for wireless Internet access.]

Published Date: Feb 20, 2012

PowerBook (FireWire): Upgrading Memory

This article provides information on performing memory upgrades on the PowerBook (FireWire).
This article has been archived and is no longer updated by Apple.
The computer has two RAM expansion slots that accommodate standard SO (small outline) DIMMs. The lower slot is occupied by a factory-installed SO-DIMM, the upper slot is available for upgrade. The computer supports a maximum of 512MB of memory using two 256MB SO-DIMMs.

You should not need to remove the processor card module unless you are upgrading the memory in the lower slot. If you do remove the processor card module, make sure that it is firmly seated when you reinstall it. Failure to do so can result in a blank screen when you restart the computer.

Note: PowerBook G3 Series computers used PC66 RAM that is not recommended for use with the PowerBook (FireWire); Apple does not provide support for such a configuration. It is recommended that you obtain memory specifically designated for use with the PowerBook (FireWire).

Memory for the PowerBook (FireWire) must be:

- PC100 Compliant
- 3.3-volt
- unbuffered
- low-power
- 64-bit-wide
- 144-pin
- 8-byte
- up to 2.0 inches tall

Follow these steps to install the memory.

1. Shut down your computer, remove the battery from the expansion bay, and disconnect the power adapter, modem, and any other cables connected to the computer.

2. Make sure that the keyboard locking screw, located between the F4 and F5 keys, is not in the locked position. Your new PowerBook comes with the keyboard unlocked, so unless you or someone else locked the keyboard, you can skip this step. If it is locked, turn the screw one half turn in either direction so that the screw slot is oriented horizontally.

Warning: The internal components of your PowerBook may be hot. If you have been using your PowerBook, wait 30 minutes after shutting down your computer to let the internal components cool down before continuing.

3. Release the keyboard by pulling down on the keyboard release tabs (located to the left of the F1 and F9 keys) until the top portion of the keyboard pops up.

4. Lift the top portion of the PowerBook keyboard up slightly near the top row of keys and pull it back far enough to displace the small tabs that hold the bottom of the keyboard in place.

5. Flip the keyboard over and lay it on the palm rests and trackpad.

6. Touch a metal surface inside the computer to discharge any static electricity.

7. With a Phillips screwdriver, remove the screws that secure the internal heat shield.

8. Lift up the internal heat shield.

9. Locate the empty RAM expansion slot.

10. Hold the RAM expansion card at a 30-degree angle. Line up the notch in the card with the small tab in the RAM expansion slot. Then push the RAM expansion card into the expansion slot.

Note: You may feel some resistance. If you are having trouble inserting the card, try pushing one side at a time.

11. Gently push the RAM expansion card down until the two snaps on either side of the card lock into place.

12. Insert the internal heat shield.

Important: When replacing the internal heat shield, make sure it does not cover the plastic tabs for the hard disk and optional AirPort Card. The plastic tab for the processor module should be placed under the heat shield.

13. Press down on the bottom portion of the heat shield to secure it and then replace the screws.

Published Date: Feb 20, 2012

AirPort: Using a Non-AirPort-Capable Computer to Set Up a Base Station

This article provides procedures for using a non-AirPort-capable computer to set up an AirPort Base Station. If you cannot find the information you are looking for in this document, check the Apple Support Web site at http://www.apple.com/support.
This article has been archived and is no longer updated by Apple.

System Requirements

To use a non-AirPort-capable computer to set up an AirPort Base Station, the non-AirPort-capable computer must have:

- At least 32 MB of memory (RAM)
- Mac OS 8.6 or later
- Mac OS 9.0.4 or later is required to use AirPort 1.3 or later.

Installing the AirPort Admin Utility

With a non-AirPort-capable computer, use the AirPort Admin Utility to set up your AirPort Base Station.

Install the AirPort Admin Utility by dragging the AirPort Admin Utility Folder to your hard disk.

Configuring the AirPort Base Station

To set up your AirPort Base Station to access the Internet, you need:

- An Ethernet crossover cable, Ethernet network, or 802.11 wireless networking card
- An Internet account

Setting up your AirPort Base Station involves the following procedures:

- Configuring the TCP/IP settings on your computer to communicate with the AirPort Base Station.
- Using the AirPort Admin Utility to set up an AirPort network .
- Setting up the AirPort Base Station to access the Internet.

Connecting to the AirPort Base Station via wireless network

If you have a third-party wireless networking card, you may be able to set up your AirPort Base Station wirelessly.

To set up your Base Station wirelessly, do the following:

1. Open the TCP/IP control panel.

2. Choose the name of your third-party wireless card from the "Connect via" pop-up menu.

3. Choose DHCP from the Configure pop-up menu.

4. Close the window and save your changes.

5. Open the AirPort Admin Utility.

6. Click Other.

A message appears requesting the IP address of the base station you would like to open.

7. Type the IP address 10.0.1.1.

8. Enter the password "public."

9. Click Configure.

10. Follow the instructions in "Setting up your AirPort Base Station network" and "Setting up your AirPort Base Station to access the Internet" to set up your Base Station.

If you are unable to set up the base station wirelessly, use the instructions below to set up your base station using Ethernet.

Configuring TCP/IP to access the AirPort Base Station via Ethernet

Note: If your computer and your base station are on an Ethernet network using DHCP, don't perform the following steps. Skip ahead to "Connecting to the AirPort Base Station." If you don't know whether your network uses DHCP, ask your network administrator or ISP.

1. Open the TCP/IP control panel.

2. Choose Configurations from the File menu.

3. Click Default.

4. Click Duplicate.

5. Name the new configuration "Base Station Access" and click OK.

6. Click Make Active.

7. Choose "Ethernet" or "Ethernet built-in" from the "Connect via" pop-up menu.

8. Choose Manually from the Configure pop-up menu.

9. In the IP Address box, type 192.42.249.11.

10. In the "Subnet mask" box, type 255.255.255.0.

11. Make sure the "Router address" box is empty.

12. Close the TCP/IP control panel and save your changes.

Connecting to the AirPort Base Station

1. Connect the base station to your computer.

If you are using an Ethernet crossover cable, connect one end of the Ethernet crossover cable to your computer and the other end to the AirPort Base Station. If you are using an Ethernet network, connect the base station and your computer to your Ethernet hub.

2. Open the AirPort Admin Utility.

3. Select your base station from the list. A new AirPort Base Station has the name AirPort Base Station.

4. Click Configure.

If a message asks you to enter an IP address and password, type the address 192.42.249.12.

5. Type the password "public" and click OK.

The AirPort Admin Utility Configuration window appears. You are now ready to set up your AirPort Base Station.

Setting up your AirPort Base Station network

The AirPort tab enables you to name and provide passwords for the AirPort Base Station and for the network it creates.

You use the base station name and password only when you are configuring the base station. Users who want to join your AirPort network (to access the Internet or share files wirelessly) use the network name and password.

To set a network password, click the Enable Encryption (Using WEP) checkbox. After checking this box, click Change Password and enter the password of your choice.

Note: Some third-party wireless networking cards may not support the encryption feature. Do not enable encryption if your third-party wireless networking card does not support the encryption feature. Contact the card's manufacturer for questions about encryption.

Setting up your AirPort Base Station to access the Internet

For dial-up (PPP) Internet connections

To set up your AirPort Base Station to access the Internet using PPP, do the following:

1. Click the Internet tab of the AirPort Admin Utility configuration window.

2. Choose Modem from the Connect using pop-up menu.

3. In the Configure modem section, type the phone number for your ISP, your user name, and your password. If the computer you're using is set up to access the Internet using PPP, you can copy this information from the Remote Access control panel.

4. In the Configure TCP/IP using PPP section, type two DNS IP addresses appropriate to your ISP and your ISP's domain name.

Contact your ISP if you do not have this information.

IMPORTANT You must provide accurate DNS address information in the AirPort Admin Utility. See the AirPort Read Me for important compatibility information about the AirPort Base Station and server-assigned DNS addressing.

5. Click Update.

For DSL or cable modem Internet connections

To set up your AirPort Base Station to access the Internet using a cable modem or DSL, do the following:

1. Click the Internet tab of the AirPort Admin Utility configuration window.

2. Choose Ethernet from the "Connect using" pop-up menu.

3. In the Configure TCP/IP section, type the settings appropriate to your ISP. Contact your ISP if you do not have this information.

4. Click Update.

Using your AirPort Base Station

Connecting to an AirPort Base Station from a Computer Using Third-Party Wireless Software

If you are using a computer running wireless software other than AirPort, you may be able to connect to the AirPort Base Station and use it for Internet access. However, the network password you enter is different from the one AirPort users enter.

To find the network equivalent password for your AirPort Base Station, do the following:

1. Open the AirPort Admin Utility.

2. Select your base station from the list.

3. Click Configure.

4. Type the password for your base station.

5. Choose Network Equivalent Password from the Base Station menu.

The window displays the network equivalent password for your base station.

Connecting to the Internet

1. Connect the AirPort Base Station to your preferred means of Internet Access (telephone line, cable modem, or DSL router).

2. Change the TCP/IP settings on your computer to use DHCP and choose the option from the "Connect via" pop-up menu that is appropriate for your third-party wireless networking card.

3. Open an Internet program such as a Web browser. The AirPort Base Station automatically initiates a connection to the Internet when it receives an Internet request.

Finding Help - If you are using the AirPort Admin Utility with a non-AirPort-equipped computer, the "Wireless Internet and networking" section of Mac Help is not installed. For more information, see the AirPort Read Me file and Balloon Help in the AirPort Admin Utility.

For information about the compatibility of third-party 802.11 wireless networking cards, contact the card's manufacturer.

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

FireWire: Maximum Number of FireWire Devices

Learn about the number of maximum AC-powered and bus-powered FireWire devices you can use with FireWire capable Macintoch computers. This article has been archived and is no longer updated by Apple.

FireWire Devices

FireWire capable Macintosh computers support a maximum of 63 powered FireWire devices. You can connect a maximum of 16 FireWire devices in one chain.

Bus-powered FireWire Devices

When connecting multiple bus-powered FireWire devices to a computer, be careful that the total power consumed by the devices isn't more than the computer can provide. If the power draw exceeds the computer's limit, all devices on the FireWire bus may shut down unexpectedly during heavy activity. For example, copying several files from one FireWire drive to another.

If you experience FireWire devices shutting down unexpectedly:

- Use devices that have their own AC power supply. For example, plug device directly into a power outlet.
- Plug devices into separate FireWire ports instead of chaining them together.
- Reduce the number of FireWire devices connected to the computer.

PowerBook (FireWire): What is New and Different?

This article provides a brief description of some of the new features of the PowerBook (FireWire).
This article has been archived and is no longer updated by Apple.
FireWire - There are two 400 Mbps FireWire ports on the PowerBook (FireWire) computer providing connectivity to high speed FireWire devices such as hard drives and digital video cameras.

DVD decoding via software - All configurations of the PowerBook (FireWire) provide the ability to view DVD movies without the need for a dedicated DVD hardware decoder.

No SCSI port - The external SCSI port has been removed and replaced with two FireWire ports.

Power adapter similar to iBook - The PowerBook (FireWire) uses a power adapter similar to that used with the iBook.

Published Date: Feb 20, 2012

PowerBook (FireWire): Supports Preserve Memory Contents on Sleep

The PowerBook (FireWire) provides the ability to save memory contents to the hard disk during a battery swap or other loss of power.
This article has been archived and is no longer updated by Apple.
Note: For compatibility reasons, the Preserve Memory Contents on Sleep feature has been removed in Mac OS 9 versions 9.0.4 and later. You may still see the option in the Energy Saver control panel but it will be dimmed.

The PowerBook (FireWire) supports hibernation. Hibernation is activated when you select "Preserve memory contents on sleep." in the Energy Saver control panel shown in Figure 1. In this mode, the computer saves the entire contents of RAM to an invisible file on the hard disk before going to sleep. When the computer comes out of sleep, the file is read back into RAM. If for some reason the computer loses power and shuts off, it can still start up to the exact state it was in before sleeping and not lose any data stored in RAM.

Hibernation requires that Virtual Memory be turned on.

When you press the Power key, the computer starts up and automatically reloads the RAM contents from the hard disk.

The computer goes through a process similar to a normal startup, but it does not display the startup screen or the extension icons; instead, it displays a progress bar. After it restores the prior state, the computer resumes execution of whatever application was executing at the time the power was lost.

Figure 1 Energy Saver Control Panel

Additional Features of Energy Saver Control Panel

Wake options

Wake when the modem detects a ring - If the internal modem is connected and this option is selected, then the PowerBook awakens. This allows any software which needs to answer the call (such as fax software) to answer the call.

Wake when the computer is opened - This awakens the PowerBook whenever the lid is opened. Combined with preserve memory contents on sleep, this option provides instant access to applications whenever needed.

Other Options

Reconnect to servers on wakeup - When selected, the PowerBook tries to connect to any AppleShare servers that you were logged into before going into sleep. With just this option selected, and not remember my passwords, you are prompted to reenter your password for all the servers being remounted. This option can also cause the PowerBook to take longer to come out of sleep since it is remounting all the servers.

Remember my passwords - This option when selected allows the servers to be remounted without requiring you to reenter the password for the server.

Allow processor cycling - When selected, this option causes the PowerPC processor to go into low power mode after a few seconds of computer inactivity . When the processor goes into low power mode, it runs at 20 percent of normal speed, saving power.

USB: What Are Class Drivers?

While the majority of USB devices have drivers written specifically for them by the manufacturer, Apple includes USB Class drivers with the Mac OS that will control the majority of these devices. This article describes class drivers.
This article has been archived and is no longer updated by Apple.
Class drivers are software components that are able to communicate with many USB devices of a particular kind, such as disk drives, printers, or scanners. If the appropriate class driver is present, any compliant device can be plugged in and start working immediately without the need to install additional software. Mac OS 9 includes USB Mass Storage Support 2.0, a class driver that supports devices that meet the USB Mass Storage Class specification.

Because class drivers are written for generic classes of USB peripherals, some product specific features may not be available. If you find that some specific USB device function is not working, you may need to install the drivers included with the device, or download the most current version from the vendors Web site.

PowerBook (FireWire): Physical Ports, Controls, and Connectors

This article provides a picture and description of the physical ports and connectors used in the PowerBook (FireWire).
This article has been archived and is no longer updated by Apple.
Below is a picture of the ports on the back of the PowerBook (FireWire).

Figure 1: External Ports and Features

From left to right the ports on the back are:

Power Adapter port
Sound input port
Sound output port
USB ports (2)
Ethernet port (10/100BaseT)
FireWire ports (2)
TV out port
External monitor port
Reset button
Internal Modem port (RJ11)
Infrared window

Below is a picture of the PowerBook (FireWire) with the keyboard flipped back.

Figure 2: Internal Features

Published Date: Feb 20, 2012

PowerBook (FireWire), G4: Keyboard Locking Screw

The PowerBook (FireWire) and PowerBook G4 have a keyboard locking screw that is similar to the iBook; it is not similar to the keyboard locking screw in the PowerBook G3 Series.

This article has been archived and is no longer updated by Apple.
To release the keyboard locking screw, turn the screw one half turn in either direction so that the screw slot is oriented horizontally. Your PowerBook comes from Apple with the keyboard unlocked.

Figure 1 Keyboard locking screw

AirPort Base Station: How to Set up for Active Roaming

By combining multiple AirPort Base Stations with Ethernet for active roaming, AirPort-equipped client computers can log on to the network only once and move transparently between locations.
This article has been archived and is no longer updated by Apple.
AirPort-equipped computers connected to two or more different AirPort Base Stations can communicate with each other when the base stations are joined by a wired Ethernet network. Each base station may offer its own wireless network to clients, or the base stations may be set up for "active roaming," a configuration in which two or more base stations appear as one wireless network to client computers.

Note: Though an AirPort Base Station communicates wirelessly with AirPort-equipped computers, it cannot do so with other base stations. This means you must have Ethernet to connect LAN users across multiple base stations.

Active roaming and its advantages

Active roaming allows computers on one AirPort network to move throughout a coverage area greater than the 50 m radius provided by a single base station. An AirPort user with an iBook, for example, can log on to the network once then move into the coverage area of a different base station without having to log on again. By placing base stations strategically, you may also work around obstructions such as structural concrete or steel.

Setting up active roaming

To use active roaming, you must have AirPort 1.1 or later software. You may download AirPort 1.3 from Apple Software Updates (http://www.apple.com/swupdates/). These steps are performed using the AirPort Admin Utility.

1. Connect all the AirPort Base Stations to the same subnet on your Ethernet network.

2. Give the same network name and password to each base station.

3. Be sure that all base stations have the checkbox for "Enable AirPort to Ethernet bridging" checked.

Setting up DHCP with active roaming (optional)

These steps are performed using the Network pane of the AirPort Admin Utility.

1. Set one base station to act as a DHCP server by clicking the checkbox to "Distribute IP addresses."

2. For the same base station, click the radio button to "Share a range of IP addresses (using only DHCP)." In the corresponding fields, add a range of real IP addresses for client computers.

   Important: You should not use network address translation (NAT) with active roaming. Client computers on an active roaming network should receive real IP addresses via DHCP or manually.

3. Be sure that all base stations have the checkbox for "Enable AirPort to Ethernet bridging" checked.

4. Be sure that all base stations other than the one selected as DHCP server are acting as bridges only and do not have the checkbox checked for "Distribute IP addresses."

Learning more

AirPort 1.3 introduces new features including Base Station Density and Multicast Rate. For information on these and other considerations of setting up a network with multiple base stations, please see the document "Designing AirPort Networks." This document may have been installed on your computer by the AirPort Installer. It is also found at Apple Software Updates (http://www.apple.com/swupdates/).

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**."
Published Date: Feb 20, 2012

AirPort Base Station (Graphite): Configuring As A Bridge

You may set up the AirPort Base Station (Graphite) to act as an AirPort-to-Ethernet bridge but not a router.
This article has been archived and is no longer updated by Apple.
The AirPort Base Station may be set up to act as only a bridge to your Ethernet network. To do so, follow these steps:

1. Open the AirPort Admin Utility.
2. Click the Network tab.
3. Ensure the checkbox for Distribute IP addresses is unchecked, as shown in Figure 1.

This turns off Network Address Translation (NAT) and DHCP routing in the base station making it act as a bridge only.

Note: With NAT and DHCP disabled, the AirPort Setup Assistant will not be able to communicate with the Base Station.

Figure 1 AirPort Admin Utility window

Note: When you use an AirPort-equipped computer as an AirPort Software Base Station, the bridging feature is not available.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access"**
Published Date: Feb 20, 2012

PowerBook (FireWire): Intermittent Errors at System Startup Time

PowerBook (FireWire) computers may have intermittent errors at system startup time.
This article has been archived and is no longer updated by Apple.

Symptom

You may sometimes see one of these errors at system startup time:

- bus error
- address error
- type 11 error

These errors may be caused by the SerialShimLib shared library.

Affected products

- PowerBook (FireWire) computer

Solution

Use the Software Update control panel to download and install Mac OS 9 Update (9.0.4). You can also download it from Apple Software Updates at http://www.apple.com/swupdates/ .

Published Date: Feb 20, 2012

Macintosh Server G4: Power Supply Needs Replacement Alert Box

On a small number of Macintosh Server G4 computers an alert box with a message that says the power supply needs to be replaced may appear. This document provides more information on the root cause of this alert.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears:

> "Your server's redundant power supply requires attention. It is recommended that the power supply be replaced to maintain system reliability. Contact you Apple service provider for details."

Figure 1 Redundant power supply alert

Solution

This alert box is likely to appear when server computers have no additional PCI cards or hard drives installed in them. In this configuration, there is not enough current draw on the +5 V line and the power supply reports this low current situation to the Mac OS. This, however, does not indicate there is an issue with the power supply.

If this alert appears on your server computer, and it is otherwise working normally, you may ignore this alert. Installing additional PCI cards or hard drives will provide additional load against the power supply and remove the likelihood that the alert box will appear.

If this is not possible, contact your Apple Authorized Service Provider for additional details.
Published Date: Feb 20, 2012

AirPort Base Station: DHCP Client ID Support

This article discusses how an AirPort Base Station works with DHCP Client ID.
This article has been archived and is no longer updated by Apple.

AirPort 1.3 software

The AirPort Base Station can accommodate a DHCP Client ID while providing Network Address Translation (NAT). This is one advantage of updating to AirPort 1.3.

If your network or Internet service provider requires the DHCP Client ID, follow these steps to add it:

1. Open the AirPort Admin Utility.
2. Click the Internet tab.
3. Choose Ethernet from the Connect Using pop-up menu.
4. Choose DHCP from the Configure TCP/IP pop-up menu. The DHCP Client ID field becomes available.
5. Enter the DHCP Client ID in the field.
6. Click Update.

AirPort 1.2 and earlier software

Though the AirPort Base Station does not accommodate DHCP Client ID, there are two solutions available. In either solution, the DHCP Client ID would be entered in the individual TCP/IP control panels of the computers that connect wirelessly to the AirPort Base Station.

Important: You should update your AirPort Base Station to AirPort 1.3 software. The presented solutions, while valid, require the dedication of time and resources that are unnecessary if you update your software. These solutions are presented for your information only.

Solutions for DHCP Client ID with AirPort 1.2 and earlier

An IP Address for Each Computer

1. Obtain additional DHCP leases from your Internet Service Provider or network administrator for each computer that will connect to the base station. A DHCP lease is the ability for one computer to obtain the IP address necessary to connect to the Internet. If your provider or network uses static IP addresses instead of DHCP service, obtain additional static IP addresses.
2. Set up the AirPort Base Station as a bridge only.

Add a Router

1. Set up a separate router on the network for DHCP and NAT services. Routers come in many sizes, from industrial strength to table top. A computer with two Ethernet interfaces and routing software may also serve the same purpose.
2. Set up the AirPort Base Station as a bridge only**.**

Important: Bridging may adversely affect other network services in certain environments. If you have a cable modem, you should not use the AirPort Base Station for bridging combined with NAT (network address translation) and DHCP services. NAT and DHCP services may be run on a separate router.

Note: Computers that are set up as AirPort software base stations do not have a bridging feature.

For related information, please see article 58597: "**AirPort Base Station: Configuring As A Bridge**"

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access"**

Published Date: Feb 20, 2012

PowerBook (FireWire): Device Control In Final Cut Pro

This article describes an issue and provides a resolution to controlling some Digital Video (DV) devices using Final Cut Pro on a PowerBook (FireWire) computer.
This article has been archived and is no longer updated by Apple.

Symptom

After controlling some DV cameras and video cassette decks with Final Cut Pro, you may lose communication with the camera or deck. In some cases Final Cut Pro may stop responding. This symptom is seen with the following devices:

- Sony DSR-20
- Sony GV-D300
- Sony GV-D900
- Sony PC-10
- Sony TRV-7
- Sony TRV-9
- Sony TRV-9E
- Sony WV-D9000

Solution

Use the Software Update control panel to download and install the Mac OS 9 Update (9.0.4), which includes FireWire 2.3.3. You can also download Mac OS 9 Update from Apple Software Updates at http://www.apple.com/swupdates/ .
Published Date: Feb 20, 2012

PowerBook (FireWire): Late Breaking News

This article is the Late Breaking News contained in the Mac Help for the PowerBook (FireWire). Because this article is quite long, you may want to use the search feature of your Web browser to find exactly what you are looking for.
This article has been archived and is no longer updated by Apple.

About your PowerBook

This document contains important late-breaking information about your PowerBook. For additional information, see the other sections of Mac Help or check out the Apple Support Site on the Internet at http://www.apple.com/support/powerbook

Important Information About Your PowerBook

AirPort software - AirPort 1.1 contains a preview version of the new software base station feature. This feature allows an AirPort-enabled computer to function as a base station for an AirPort network. An updated version of the software base station feature will be available soon from Apple. For the latest information, go to the Apple's Support Web site at www.apple.com/support.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: **"AirPort: Requirements for Wireless Internet Access"**

Using your PowerBook in FireWire Target Disk Mode - When setting up for FireWire Target Disk Mode, make sure that your PowerBook is the only FireWire device connected to the other computer and that no additional FireWire devices are connected to your PowerBook. If additional FireWire devices are connected, FireWire Target Disk Mode will not work.

Using your PowerBook

Selecting a startup disk - Make sure a valid startup disk is selected in the Startup Disk control panel. If an invalid startup disk is selected (one your computer cannot start up from), your computer may take as long as two minutes to locate a valid startup disk and start up properly. A RAM disk cannot be used as a startup disk, even though its icon may appear in the Startup Disk control panel.

If you select the Network Disk icon in the Startup control panel and are not connected to a Netboot server, your PowerBook will take significantly longer to start up.

Preserving the contents of memory before putting your computer to sleep - You can save the contents of memory on the computer's hard disk before your computer goes to sleep using the Advanced settings section of the Energy Saver control panel (for more information, see Mac Help). After you close the lid to put your computer to sleep, don't move the computer for approximately 20 seconds. When the save process is complete, the sleep indicator light blinks.

IMPORTANT: You must have virtual memory turned on in the Memory control panel to use this option.

Note: For compatibility reasons, the Preserve Memory Contents on Sleep feature has been removed in Mac OS 9 versions 9.0.4 and later. You may still see the option in the Energy Saver control panel but it will be dimmed.

Trouble connecting the internal modem in V.90 mode - Your computer comes with an internal 56K modem based on the V.90 specification. If the modem won't connect at all in V.90 mode or the connection is dropped after a few minutes, the phone lines may be too noisy or there may be too much interference to sustain a connection at speeds above 33.6 kilobits per second (Kbps). Contact your ISP to ensure that it is using V.90-compliant modems or plans to use them in the future. Use the Apple Internal 56K Modem (V.34) modem script, which forces the modem to connect at 33.6 Kbps or lower speeds. This type of connection is more reliable in situations where the phone line quality is questionable.

To use the Apple Internal 56K Modem (V.34) modem script, follow these steps:

1. Open the Modem control panel in the Apple menu.
2. Make sure the "Connect via" pop-up menu is set to Internal Modem.
3. Open the Modem pop-up menu and choose Apple Internal 56K Modem (V.34).
4. If necessary, set the Sound and Dialing options.
5. Close the control panel.
6. Click Save.

You do not have to restart your computer.

Formatting external USB (Universal Serial Bus) hard disk drives - Many USB hard disk drives are DOS-formatted at the factory. You can

use DOS-formatted USB hard disks with your computer, but you will get much better performance if the USB hard disk is formatted as Mac OS Extended or Mac OS Standard format. To reformat the hard disk to Mac OS Extended or Mac OS Standard format, use the formatting utility that came with the USB hard disk. If you do not have a formatting utility, you can change the drive to Mac OS format by following the steps below.

For instructions for reformatting your hard drive, choose Mac Help from the Help menu. Go to the section, "Erasing a disk" and follow the onscreen instructions.

Copying and pasting alert sounds - Long alert sounds require large amounts of memory. If you have difficulty copying and pasting long alert sounds into the Sound control panel, you may need to adjust memory requirements for the control panel. To do this, open the Control Panels folder within the System Folder. Select the Sound control panel. From the File menu, choose Get Info and from the pop-up menu, choose Memory. In the Memory Requirements section, increase the preferred memory size until you are able to copy and paste the alert sound. The amount of memory needed depends on the sound quality of the sound input device you are using.

Adjusting and testing external speakers - The Speaker Setup section of the Sound control panel allows you to adjust the speakers connected to your computer. Use the Speaker Setup panel to select which speakers you want to use and to adjust the relative volume for each speaker. For example, if you have a subwoofer connected to your computer and want to adjust the volume for the subwoofer only, use the slider underneath the subwoofer to change the volume.

You can also test the speakers connected to your computer by clicking Start Test in the Speaker Setup section.

IMPORTANT: You should reduce the overall sound volume for your computer using the Output section of the Sound control panel before testing your speakers, because the test tone can be quite loud.

The computer plays a "white noise" test tone on each speaker, allowing you to adjust the relative volume of that speaker. The "white noise" test tone contains sound for all frequencies and sounds like static.

Playing and recording from audio CDs - Audio CD playback is now done digitally for increased fidelity and use with digital audio peripheral devices. When you play audio CDs, you no longer have to select Internal CD in the Input section of the Sound control panel or the Sound section of the Control Strip. To record from an audio CD, you may need to select Internal CD in the Input section of the Sound control panel or the Sound section of the Control Strip.

Connecting to an Ethernet network - When you connect your PowerBook to an Ethernet network, the computer automatically senses whether it is connected to a 10Base-T network or to a 100Base-T network. Some ports on some network hubs/switches support both speeds. If you're using this type of hub/switch, there may be a delay in establishing a network link. The delay may last for several seconds after you start or restart the PowerBook and a message may appear saying the network is not available or that the network has only just become available. If you don't want a delay, connect your computer to an Ethernet network port that is not auto-sensing (10 or 100 megabits per second (Mbps) only). For more information, contact the manufacturer of the Ethernet hub/switch or your network administrator.

Performance problems using Ethernet - If you experience performance problems on your Ethernet network, check with your network administrator. Your computer performs best when the Ethernet port is set to auto-negotiate.

IMPORTANT: The duplex mode of an Ethernet link to a switch is not detected if the switch's port is not auto-negotiating. If the switch's port is not auto-negotiating, your computer will detect the appropriate speed but default to half-duplex. If the switch's port at the other end of the link is configured for full-duplex, a large number of late events can occur on the link. Set the switch's port to auto-negotiate where possible. If this isn't possible, then set the switch's port to half-duplex. For more information, see the documentation that came with the Ethernet hub.

Connecting your computer directly to an Ethernet switch - If you connect your PowerBook directly to an Ethernet switch, you must disable spanning tree on that port. Otherwise your computer may duplicate the AppleTalk address of another computer on the same network and both network connections may become unreliable.

Using a RAM disk - A RAM disk allows you to use part of the built-in random-access memory (RAM) in your computer as a high-speed storage disk. To set up a RAM disk, use the Memory control panel. For more information, see the topic "Improving performance of disk-intensive programs" in Mac Help.

Note: The contents of a RAM disk are saved on the startup disk when you restart your computer. After the computer restarts, the contents are restored. Large RAM disks may add additional time to shutting down and restarting the computer and may not leave enough room for you to run any applications.

WARNING: You should regularly back up the contents of your RAM disk on another disk. The contents of the RAM disk can be lost if:

- the startup disk is read-only, such as a CD-ROM disc
- the startup disk does not have sufficient space to store the contents of the RAM disk
- the startup disk does not have a valid System Folder
- the computer loses power

Note: Your computer will not save the contents of memory to the hard disk (preserve memory contents on sleep option in the Energy Saver control panel.) when the computer is in sleep if a RAM disk is used.

Using your computer with a NetBoot Server - If you want to use your PowerBook as a NetBoot client, you may need to update the system software on the NetBoot Server. Check the Mac OS X Server Web site at http://www.apple.com/macosx/server or the Apple Support Web site at http://www.apple.com/support for instructions.

Battery indicator icon - If the battery indicator icon in the menu bar has an X through it, make sure to let the internal battery charge for several minutes. If your PowerBook battery has been completely discharged, it may take several minutes of charging for the battery icon to recognize the battery.

Important information about system sleep - Certain system settings may prevent your computer from going to sleep. You may notice that the screen dims, but the sleep indicator light does not pulse. Leaving your computer in this state will cause your battery to become depleted quickly if the power adapter is not plugged in.

The Palm Desktop HotSync function may prevent your computer from going to sleep. To turn off the HotSync function, open Palm Desktop and choose Setup from the HotSync menu. Then click the Disabled button and make sure the "Enable HotSync software at system startup" checkbox is not selected. You will have to turn on HotSync when you want to synchronize with your Palm device.

If the Configure pop-up menu in the TCP/IP control panel is set to Using DHCP Server, your computer may not sleep when your Web browser or e-mail application is open or a file server is mounted on your desktop. Quit these applications and dismount file servers when they are not being used.

To allow your computer to sleep, you must disable FAXstf auto-answering. To do this, open FaxBrowser and choose Settings from the Edit menu. Then choose the FaxModem icon and select Never from the Answer On pop-up menu

When the IrDA method of infrared (IR) communication is selected in the AppleTalk control panel and AppleTalk is on, the computer will not go to sleep automatically.

Many communications programs, such as PPP, Apple Remote Access, and other dial-up programs, monitor the computer's modem port to check for incoming transmissions. This may mean that the computer will not go to sleep automatically (after the interval set in the Energy Saver control panel). Forcing the computer to sleep may result in a lost connection or crash. When your computer is using the battery, you may want to quit a communications program whenever you are not using it to conserve the battery's charge. (See the manual that came with your communications program for more information.)

When using fax software your computer will not completely sleep and the screen will only dim (instead of turn off) when fax software is set to auto answer. To avoid draining your computer battery, plug in the power adapter when waiting to receive a fax.

When the computer is waking from sleep,do not press the DVD-ROM drive button. This will cause unexpected behavior. If this happens close the DVD drive tray.

Using older printers - Printer driver software for some older printers is located in a folder called Additional Printer Drivers, within the CD Extras folder on your software install CD. These extensions are Color SW 1500 (for the Color StyleWriter 1500), Color SW 2500 (for the Color StyleWriter 2500), Color SW Pro (for the Color StyleWriter Pro), CSW 6000 Series (for the Color StyleWriter 6000 series), and ImageWriter.

Starting up from expansion bay devices - If you need to start up from an expansion bay module, insert the module before you start up.

Ejecting a PC Card - To eject a PC Card, drag the card's icon to the Trash and then use the PC Card eject button to eject the card.

Starting up from an external FireWire or USB device - If you start up from an external FireWire or USB hard disk, the disk must be connected and turned on before you turn on the computer.

Inserting an AirPort Card - The Apple AirPort Card is designed to fit only in the internal AirPort Card slot. Do not insert an AirPort Card in your computer's PC Card slot. To use the PC Card slot for AirPort, insert a compatible third-party wireless card.

About Apple DVD Player software - Your computer includes Apple DVD Player software as part of Mac OS 9.0. This version Apple DVD Player is not compatible with the DVD hardware in the Power Macintosh G3, older versions of the PowerBook G3 Series, and Power Mac G4 (PCI graphics) series computers. For the latest information about Apple DVD Player and answers to support questions, go to Apple's Support Web site at http://www.apple.com/support.

Third-party software issues

Graphics problems with games - Some games may exhibit drawing problems because not enough memory is available to load all of the required system components. Use the memory control panel to increase the amount of virtual memory so these components can load. If your virtual memory size is set to the default, increase the size by half the amount of physical memory you have installed. For example, if you have a 64MB system, set the virtual memory size to 96MB.

Using hard disk utilities and disk-locking programs - Some disk utility and disk-locking programs are incompatible with Mac OS Extended format. Before you use a disk utility or disk-locking program, make sure the version you have is compatible with Mac OS Extended format. Check the documentation that came with the program or contact the program's manufacturer.

Using fax software - To allow your computer to sleep, you must disable FAXstf auto-answering. To do this, open FaxBrowser and choose

Settings from the Edit menu. Then choose the FaxModem icon and choose Never from the Answer On pop-up menu.

Note: To avoid draining your computer battery, plug in the power adapter when waiting to receive a fax.

Using the internal modem with third-party software - Some third-party software, such as FAXSTF or Total Access, has different modem selections from the ones in the Modem control panel. Using these selections can slow down your connection speed. To use these programs with your computer's internal modem at its highest speed, make sure you select Apple Internal 56K Modem (V.90) in the Modem control panel.

Using Palm Desktop Software 2.5 - If you make a connection and a sync fails or doesn't complete, set the connection speed to a lower setting. To do this, open HotSync Manager (click the icon next to the Application menu, choose HotSync, and in the pop-up menu, choose Setup). Click the Serial Port Settings tab. In the Local Setup section, select 19200 as the speed.

FWB Hard Disk Toolkit 3.0.2 - FWB Hard Disk Toolkit 3.0.2 is not compatible with this computer. For more information, contact the software publisher.

Setting up your Internet account when the Palm Desktop Software 2.5 is installed - If you installed the Palm Desktop Software 2.5 on your computer and you attempt to set up AOL, there is a conflict and a message may appear saying you have a "port in use" error. You need to disable HotSync to set up your Internet account. To do this, open HotSync Manager (click the icon next to the Application menu, choose HotSync, and in the pop-up menu, choose Setup). If necessary, click the HotSync Controls tab. In the HotSync section, click the Disabled button.

Virtual PC - To run Virtual PC, your computer needs to have more than 64 MB of RAM installed.

Moving Bookmarks and Favorites files before reinstalling Internet Explorer and Netscape Communicator - If you inadvertently delete the Internet Explorer or Netscape Communicator applications, you can reinstall the applications using the software install CD that came with your computer. Before you reinstall Internet Explorer or Netscape Communicator, you must move the file that contains your Internet sites list to a different location, such as the desktop. In Internet Explorer, this file is Favorites.html; in Netscape Communicator, the file is Bookmarks.html. When you reinstall Internet Explorer or Netscape Communicator, the program overwrites these files and any locations or bookmarks that you added or that were preinstalled will be lost.

Hardware compatibility issues

Connecting USB devices while the computer is asleep - If you connect or disconnect a USB device while your computer is in sleep, your computer automatically wakes.

Mounting and disconnecting USB storage devices - To mount or remount a USB storage volume on the desktop, disconnect and then reconnect the device that contains the volume to a USB port on the computer, or to a USB hub attached to your computer. The volume should appear on the desktop in a few seconds. If the device uses removable media, the volume will not appear until the removable media is reinserted into the USB storage device.

Before you disconnect a USB storage device from your computer, close all open windows and quit all open applications that are stored on the USB storage device. If the device has a manual eject drive (you eject the removable media from the device yourself), make sure you eject the removable media first. Drag the device's icon to the Trash, then disconnect the device from your computer.

Using USB devices with software applications - Some applications don't recognize a USB device if the device is plugged in while the application is already open. To use the USB device with that application, quit the application, make sure the device is properly plugged in, then open the application again.

Using ADB dongles - Some applications require an ADB (Apple Desktop Bus) dongle to prevent software piracy. Your computer uses Universal Serial Bus (USB) technology. You may be able to use a USB dongle with these applications. For more information, contact the application's manufacturer.

Using USB-to-serial converters - Some serial devices such as modems, printers, and digital cameras may be used with your PowerBook using a third party USB-to-serial converter adapter. However, not all serial devices may be compatible with an adapter. For more information, contact the adapter manufacturer.

Starting up from a USB hard disk - Your computer may not start up correctly from a USB hard disk if the hard disk drivers are outdated. You may be able to remove the hard disk driver extension from the Extensions folder in the System folder and then start up from the USB disk. Check with the USB hard disk drive manufacturer for updated driver software.

Important information about external monitors - When connecting an Apple Studio Display monitor with a USB cable to your computer, make sure you connect the monitor's USB cable to a USB port on the back of the computer. The AppleVision software requires this connection.

If you have an older AppleVision or Apple Studio Display monitor that has an ADB cable in addition to the monitor cable, you can't attach the ADB cable to your computer. With older computers, the ADB cable allows you to make automatic software adjustments to the screen image. To make screen adjustments without the ADB cable attached, use the external controls on the monitor. For more information, see the documentation that came with the monitor.

Connecting a monitor that uses a DB-15 connector - To connect an older monitor that has a two-row DB-15 connector, use a Mac-to-VGA adapter to connect the monitor to the three-row VGA monitor port on the computer. For more information, see the documentation that came with

your computer.

Some Mac-to-VGA adapters don't let the monitor identify correctly itself to the computer. Incorrect screen resolutions and timings may appear as recommended settings in the Monitors control panel and the Monitor Resolution settings in the Control Strip.

To view all the screen resolutions and timings available: 1 Open the Apple menu, choose Control Panels, and choose Monitors. 2 In the Resolution section, choose All from the Show popup menu.

Using a digital video (DV) camcorder - Some DV camcorders may not be recognized immediately when you connect them to one of your computer's FireWire ports. If your computer does not recognize the DV camcorder, try turning the camcorder off and then on again to establish a connection. If you continue to have problems, contact the manufacturer of the DV camcorder.

Documentation changes

Password Security control panel - The Password Security control panel mentioned in Mac Help was designed to work with older PowerBook computers and is not installed on your PowerBook.

Apple Video Player references in Mac Help - The Apple Video Player application mentioned in Mac Help is used with older Macintosh computers that have video input capabilities. It is not installed on your PowerBook.

PowerBook (FireWire): Ensuring Battery Level Indicator Accuracy

This article describes how to ensure the battery level indicator in the control strip is accurate on the PowerBook G3 Series (Bronze keyboard), iBook, and PowerBook (FireWire).
This article has been archived and is no longer updated by Apple.
To ensure the indication of remaining battery life is as accurate as possible, the battery should be fully discharged in your computer and then fully recharged. Simply use the PowerBook without the AC power connected until it shuts itself down, then plug in AC power and recharge the battery.

If this does not work then you may need to reset the power manager. Refer to Article 14449, "**PowerBook and iBook: Resetting Power Manager**".

For the PowerBook G3 Series (family number M4753 or M5343) or the iBook (family number M2453), refer to Article 60655 "**Battery Reset 2.0: Read Me**".

Published Date: Feb 20, 2012

Gigabit Ethernet: A Brief Description

This article briefly describes gigabit Ethernet as implemented by Apple Computer on several computer models.
This article has been archived and is no longer updated by Apple.

What is it?

Gigabit Ethernet is a standard developed by the Gigabit Ethernet Alliance, and defined by the IEEE 802.3 committee. The aim of this standard is to utilize existing local area network infrastructure to achieve up to 1 gigabit per second (1 Gbps) transfer rates. This is why gigabit Ethernet utilizes Category 5 or better unshielded twisted pair cabling (UTP), and the RJ-45 connector that is used in 10/100 megabits per second (Mbps) networks.

To achieve maximum transfer rates from gigabit Ethernet capable hardware, you also need to install gigabit Ethernet compliant switches, hubs, and routers. Otherwise, the Power Mac G4 (Gigabit Ethernet) computer switches to a 10 Mbps or 100 Mbps transfer rate depending upon the network hardware that is used.

To utilize gigabit Ethernet, you must use an Ethernet cable with all eight wires (four pairs) present. If you use an inexpensive two pairs-wired cable, the maximum connection speed can only be 100 Mbps.

How to determine connection speed

Open Apple System Profiler by choosing it from the Apple menu. Click the disclosure triangle next to "Network overview" to reveal speed (10 Mbps, 100 Mbps, or 1 Gbps) and duplex information (half- or full-duplex).

Using a crossover Ethernet cable

Connecting any gigabit Ethernet capable computer to another computer via Ethernet can be accomplished with a standard four pair category 5 or better Ethernet cable. No crossover cable is necessary.

Models with Gigabit Ethernet

- Power Mac G4 (Gigabit Ethernet)
- Power Mac G4 (Digital Audio)
- Power Mac G4 (QuickSilver)
- Power Mac G4 (QuickSilver 2002)

- PowerBook G4 (Gigabit Ethernet)

AirPort: Reason for 169.254.x.x IP Address

The following article discusses the source of the 169.254.x.x address seen on AirPort clients attempting to connect to the AirPort Base Station. This article has been archived and is no longer updated by Apple.
The 169.254.x.x address is typically seen on computers set to connect to the network via Ethernet or AirPort using a DHCP server. If a DHCP (Dynamic Host Configuration Protocol) server is not found by the computer, a valid and unique address in the range of 169.254.0.0 to 169.254.254.255 inclusive and a subnet mask of 255.255.0.0 will be assigned. This feature has been built-in to every version of Open Transport since Mac OS 8.5. It is also built-in to all Microsoft Windows-based computers using Windows 95, Windows 98, or Windows 2000.

If you have been unsuccessful in trying to connect your AirPort equipped-computer to an AirPort Base Station, then you probably have seen this 169.254.x.x address. The most common reason for getting it is not associating with a base station before trying to use an application that uses TCP/IP such as a Web browser.

It may also indicate that the IP address of the base station is on a different subnet than the connecting computer. In this situation, you will need to manually assign the client computer an address that is on the same subnet before attempting to access the base station.

Remember that if you have the base station set to bridge to an existing local area network (LAN) providing IP addresses from a DHCP server, a wireless client can still obtain a 169.254.x.x address if a server is not found.

Why the 169.254.x.x address?

This 169.254.x.x address, although not an officially private address (as 10.0.0.0 would be), poses little if any chance for conflict with other addresses on the Internet. Open Transport will choose a number randomly in a range of 169.254.0.0 to 169.254.254.255 - a range of over 64,000 possible addresses.

The result of this auto configuration of addresses allows communication automatically with other 169.254.0.0 network addresses on the same LAN without a DHCP server. In other words, Macintosh and Windows-based computers with their default networking configurations installed can communicate with each other on the same LAN automatically.

The auto-configuration of IP addresses is beneficial for workgroups without a professional network administrator, as well as any LAN when its DHCP server is not available or when it has simply stopped working.

It is also very useful when using AirPort equipped-computers on an ad-hoc or computer-to-computer network.

Additional information is available in article 58619: "**AirPort Base Station: Reason for 192.42.249.12 IP Address**".

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

AirPort Base Station (Graphite): Reason for 192.42.249.12 IP Address

The following article discusses the source of the 192.42.249.12 address seen on the AirPort Base Station (Graphite).
This article has been archived and is no longer updated by Apple.
192.42.249.12 is the default address for a new base station. It is also the address assigned after a soft reset or after updating the software on the Base Station.

Note: The 192.42.249.13 address will be seen after performing a hard reset and before uploading the software into the base station.

You will also see this 192.42.249.12 when the base station is not assigned a static IP address and it is unable to receive one dynamically from a DHCP server or a dial-up Internet service provider.

Why Not a 169.254.x.x Address?

First, the base station was not equipped with the algorithm to generate such an address. Secondly, it was not designed to behave like a Macintosh computer in this manner. When the AirPort Base Station is started up, it is preset to try to obtain an IP address from a DHCP server. If no DHCP server responds, the base station will default back to the 192.42.249.12 address.

Even though the AirPort Base Station is initially setup to look for a DHCP server, it will default to 192.42.249.12 address if one cannot be found). The 192.42.249.12 address is a clue that your base station does not see a DHCP server on your network. It would be a good idea to look for any basic connectivity issues at this point, such as bad or improper cabling. If you're not even using DHCP or attempting to use a dial-up connection, this means that you have not programmed your base station and need to run the AirPort Setup Assistant.

Why Then, the 192.42.249.12 Address?

This 192.42.249.12 address is a globally valid IP address arbitrarily assigned to the base station by Apple.

How to Access a Base Station with a 192.42.249.12 address?

If you are having difficulties using the AirPort Admin Utility to reconfigure an AirPort Base Station with the 192.42.249.12 address, you have two alternate methods to access it.

These methods require that you make changes to the TCP/IP control panel or change the IP address of the computer trying to access the Base Station.

Method 1: Change the method of connection in the TCP/IP control panel.

1. Open the TCP/IP control panel and change the configuration from AirPort to PPP.
2. Close and save the setting in the TCP/IP control panel.
3. Open the TCP/IP control panel and change it back to AirPort and Using DHCP. The fields for IP Address, Subnet mask; and Router Address will say "< will be supplied by server >".
4. Close and save the settings.

Method 2: Use the TCP/IP control panel to change the IP address on your computer to 192.42.249.14. This will force your computer on to the same subnet as that of the base station.

For additional information, refer to article 58618: "**AirPort: Reason for 169.254.xxx.xxx IP Address**".

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. America Online (AOL) works with AirPort software version 2.0 or later. For more information on AOL compatibility, see technical document 106591: "**AirPort: How to Use with AOL**." Range may vary with site conditions.

Using your PowerBook as a DVD player on an external monitor or TV

If your PowerBook has a DVD-capable optical drive, you can use your PowerBook as a DVD player to watch movies on an external monitor or television.

This article has been archived and is no longer updated by Apple.

Basic Steps

1. Shut down the PowerBook and turn off the external monitor or TV.
2. Connect a video cable from the video output port on your PowerBook to the video input port on the monitor or TV. You'll have to find the right combination of ports on the computer and monitor or TV. For example, if your computer has an S-video output port and your TV has an S-video input, you could use that connection for the picture, then connect an audio cable from the sound output port on your computer to the sound input port on the TV.
3. Turn on the monitor or TV, then start up your PowerBook. You'll probably also have to switch to the video input on your TV once it's on.
4. Make sure you can see the computer's desktop and menu bar on the monitor or TV. If not, check settings in Displays preferences (Mac OS X) or the Monitors control panel (Mac OS 8 and 9). Depending on your PowerBook model, you might have to reduce the number of colors on the screen to give enough memory to the DVD Player. Choose Thousands instead of Millions of colors.
5. Deselect the Video Mirroring if it's selected. You can't watch a DVD on the built-in display and an external display or TV at the same time.
6. Open DVD Player and insert a DVD-Video disc.

Troubleshooting playback on an external monitor

1. Make sure all the connections and cabling are correct and that you can see the Macintosh desktop and menu bar on the external monitor.
2. Make sure the Video Mirroring option is deselected. You can't watch a DVD on the built-in display and an external display or TV at the same time.
3. Make the external monitor the primary display by dragging the menu bar to it in Displays preferences (Mac OS X) or the Monitors control panel (Mac OS 8 and 9), as shown here.

4. If you see the error message, "The Apple DVD Player does not support the video card or settings of the main screen.", shown here, make sure that both the internal and the external video settings are set at thousands of colors and 1024 x 768.

Troubleshooting playback on a TV

1. Follow the steps for troubleshooting an external monitor above.
2. Because the quality of the picture on a TV is not as sharp as on the PowerBook's built-in display, it might be pretty hard to see small Mac OS interface items on the TV. It can help to set the TV's resolution to 640 x 480 (NTSC) or 640 x 480 (PAL) in Displays preferences (Mac OS X) or the Monitors control panel (Mac OS 8 and 9).

   Tip: Only NTSC and PAL video output formats are available. If you have a SECAM TV, chances are the PAL signal will work just fine. Most modern TVs that work with SECAM also work with PAL. If your TV only accepts a SECAM signal, select PAL as the output and put a PAL to SECAM converter between the connection from the PowerBook to the TV.

3. You may wish to do your setup tasks using the PowerBook's built-in display as the one with the menu bar, then drag the menu bar to the TV in Displays preferences (Mac OS X) or the Monitors control panel (Mac OS 8 and 9) just before you plan to watch the movie.
4. You can use the following keyboard shortcuts to close windows and watch the movie:
   - Command-W to close the Display preferences or Monitors control panel window.
   - Command-Option-P to Present Video in Viewer (Mac OS 9) or Command-0 (zero) in Mac OS X.
   - Spacebar to start and pause the movie.

- The Controller hides itself a few minutes into the movie.
- Press F3 and F4 to increase and decrease the volume.
- Command-Q to quit Apple DVD Player when you are finished watching the movie.

For more help with DVD Player, choose DVD Player Help from the Help menu.

iBook: Does Not Support Power-on From External Keyboard

Does the iBook support soft power-on from an external USB keyboard?
This article has been archived and is no longer updated by Apple.
No, the iBook cannot be powered on from an external USB keyboard. Pressing the power button on the keyboard will have no effect on the iBook.

If the iBook is in sleep mode however, pressing the power button will awaken the computer.

Final Cut Pro: Preventing Audio Distortion

This article discusses common causes for audio distortion within movies created or edited in Final Cut Pro and how to avoid them.
This article has been archived and is no longer updated by Apple.
When audible audio distortion (crackling, popping) occurs while using Final Cut Pro, it is usually due to:

- Capturing audio at a sample rate other than the one it was initially recorded with (when importing clips from DV)
- Mixing audio clips with different sample rates together on playback

When distortion occurs outside of Final Cut Pro (for example, playing back a tape that was output from Final Cut Pro), it is usually because of too much dynamic range in the mix.

Distortion when Recording

The most frequent cause of audio distortion heard while recording clips in Final Cut Pro stems from the captured audio sample rate not matching the sample rate initially recorded onto a DV Tape. For example, if you shot footage with your camera set to record at 48 kHz, and you have the sound recording sample rate set to 32 kHz, you'll hear distortion. This distortion will be recorded into the clip.

It's easy to remember which Bit Rates correspond to which Sample Rates, and the two must always correspond:

12 bit = 32 kHz

16 bit = 48 kHz

Note: This can also be a cause of lost audio sync. For more information on this subject, see article 58640: "**Final Cut Pro: Dropped Frames and Loss of Audio Sync**".

Figure 1 The Sample settings of the Sound panel, showing the available sample rates

This setting can easily be changed. To do so:

1. Open the Capture Preferences tab.
2. Click Audio.
3. With the Sound panel open, set the upper left pop-up menu to Sample.
4. Select the appropriate sample rate from the Rate pop-up menu.

Distortion on Playback

The most frequent reason for audio distortion when playing back a mix in Final Cut Pro is the combination of too many audio clips with different sample rates. This distortion will take the form of crackling, popping, and sometimes even skipping in the audio.

Final Cut Pro, when faced with clips of varying sample rates, will resample the audio in real time. One result of this is to reduce the number of tracks that can be mixed in real time as specified in the General Preferences tab.

The other result of varying sample rates is distortion. For example, a sequence with 32 kHz audio from a consumer camcorder mixed with 48 kHz audio from a Pro camcorder and 44.1 kHz audio from a CD transfer is virtually guaranteed to create audible distortion. One solution to this would be to redub your 32 kHz source material, rerecording the audio at 48 kHz. Another solution would be to resample all 32 kHz audio using dedicated audio software, such as Bias Peak.

You should note that 44.1 kHz and 48 kHz audio generally work fine together without distortion. This is because the sample rates are so close together that the resampling is generally inaudible. With this in mind, it is important to know that Final Cut Pro is better at upsampling then it is at downsampling. For this reason, you should have your Sequence Settings default set to 48 kHz when mixing the two.

In general, you should record DV source material at 48 kHz whenever possible. Most DV cameras provide a menu setting to toggle between 32 kHz and 48 kHz. See your camera manual for more information.

Distortion Outside of Final Cut Pro

Another potential problem is when you output a sequence to tape, and when playing back the tape you notice audible distortion not present when the audio was playing out of the computer. This is generally because of too much dynamic range in the mix.

Dynamic range refers to the range from the softest sound to the loudest sound in a given sequence of clips. If this range is too great, and you set the recording input level of your VTR to record the soft parts at an acceptable volume, the loud parts will distort. Conversely, setting the recording input levels of your VTR to reflect the loud part will cause the soft parts to be too silent to hear. This is especially problematic if you're planning on sending your output tape to a dubbing facility. When making hundreds of dubs from a tape, engineers generally set the audio level of all the VTR's in the facility to match the level of the audio tone at the head of your master tape (Assuming you output to tape with bars and tone. If your audio varies widely from this benchmark, you can be sure that there will be audio problems.

The solution to this is to mix the audio levels of the different tracks in your sequence to bring the audio levels of the softer clips up and the louder clips down, in an effort to make the levels of all the clips in your sequence acceptable relative to your 0 dB reference tone. This is done by using the Clip Overlays. Clip Overlays are enabled by clicking Clip Overlays at the bottom of the Timeline window.

Figure 2 The Clip Overlays button

Once enabled, a thin red line indicates the volume of an audio clip relative to the others in a sequence.

Figure 3 Clip Overlays are the red lines in the center of the audio clips

The simplest form of mixing is to set the level up or down for the duration of the entire clip by clicking and dragging this red line. A small yellow window will indicate the new level of the clip in + or - decibels (dB). (For a hint on how to do this more precisely, refer to article 58632: "**Final Cut Pro: Using the Command Key Modifier to Make Subtle Keyframe Changes**")

Figure 4 Bringing down the audio level of the "Mahaiy" clip to -15 decibels

In this way, the relative levels of all audio clips in your sequence can be brought into an acceptable range for output to tape. More precise mixing can be achieved by setting keyframes with the Pen tool.

Use a Mixer to Set Your Audio Levels

Since it is difficult at best to accurately gauge the loudness of your mix by ear, it is a good idea to use the VU meters of an external mixing board to help you set your levels. In order for this to be effective, first play back the tone you placed at the head of your edit and adjust the level of your mixer such that the VU meter reads 0 dB Now, whenever your mix is too hot, you will have an accurate visual indicator warning you of the problem. Do not rely solely on your meter readings while mixing your tracks. Proper mixing requires careful attention to both the meter levels and to the sound coming out of your computer.

Note: It is a good idea to mix using high quality headphones. Inexpensive speakers, the physical space of a room, and the ambient noise in any home (such as refrigerators, traffic, purring cats) can all inadvertently alter the quality of what you are hearing, resulting in your producing a mix that may be louder than necessary. Wearing headphones while mixing minimizes this effect, and allows you to make better decisions about setting EQ and levels.

Using the Compressor to Reduce Dynamic Range

Other common sources of unwanted dynamic range that are not so easily fixed are music and voice-over. In both cases, the volume from one moment to the next can vary widely, but unfortunately any attempt to correct this by mixing will result in an audible change in volume, either in the background of the music or in the room tone of the voice-over. Either way, it is unacceptable to a high quality mix.

Fortunately, Final Cut Pro gives users a solution to this dilemma in the form of the Compressor/Limiter audio filter. This filter adjusts the dynamic range of the entire clip so that the loudest part is compressed to within a user selectable range of the quietest part of the clip.

Figure 5 The Compressor/Limiter filter, located in the Audio Filters folder of the Effects Pallette

To use it, simply:

1. Apply the filter to the audio clip in question via either the Effects menu, or drag and drop from the Effects bin in the Browser.
2. Double-click the audio sequence clip .

3. Select the Filters tab in the Viewer.

Application of this filter is largely a trial and error process. The Threshold parameter defines how loud the loudest portion of the clip can be before compression is applied, and is the first setting you will adjust. Ratio affects how much compression is applied. Resist the temptation to overdo this parameter; a little goes a long way, and too much will result in further distortion. Attack time defines how quickly this filter reacts to changes in volume, and release time defines how slowly it lets go (the defaults are generally fine, but you should experiment).

Figure 6 The Compressor/Limiter filter's parameters

By setting levels, mixing, and compression, you can create a professional sounding mix that will output to tape clearly and cleanly.

Final Cut Pro: Using the Command Key Modifier to Make Subtle Keyframe Changes

This article contains a tip on how to make smaller adjustments to the values of audio levels, keyframes, or graphical editing adjustments (such using the Ripple or Roll edit tools) by using the Command Key Modifier.
This article has been archived and is no longer updated by Apple.
When adjusting audio levels, keyframe values, or edit points simply clicking and dragging on the appropriate graphical element will make a change. The value of the selected parameter will change according to how far the mouse is dragged. In most cases the default 1 to 1 sensitivity of this change will be fine, but this can be modified.

Figure 1 The Command Key

In cases where you require a more subtle adjustment than the default sensitivity to mouse movement will allow, pressing the Command modifier key while clicking and dragging on a graphical control will result in much smaller changes. This modifier key will work with any click and drag parameter change. See the examples below:

Figure 2 Performing a Roll edit with the Command key modifier. Notice how the edit point lags behind the cursor, indicating slower movement.

Figure 3 Bringing down the audio level of the "Mahaiy" clip to -15 dB by clicking and dragging on the red audio Clip Overlay

Figure 4 Adjusting the Keyframe of a Video Filter by clicking and dragging on a Keyframe

Final Cut Pro: Field Dominance Discussion

This article discusses field dominance and explains why it is important to have the correct field dominance applied in your Sequence Settings.
This article has been archived and is no longer updated by Apple.
NTSC and PAL are both interlaced video formats, as opposed to computer video and some High-Definition video formats, which are capable of using progressive scanning. All video displays, whether analog or digital, work by breaking a single frame of video down into lines of horizontal resolution running across the screen. When we say that a computer uses progressive scanning, we are saying that these lines are drawn one at a time from the top of the screen down to the bottom, in order.

Figure 1 Horizontal Lines of Resolution on a Computer or High-Definition Monitor

NTSC and PAL video is different from computer video and some High-Definition video formats. NTSC runs at 29.97 frames per second (fps), though it is referred to as 30 fps for the sake of discussion. PAL video runs at 25 fps. However, when you record footage with your camcorder, it does not not capture each whole video frame at once. Instead, each video frame is broken down into two fields, with each field containing half the total lines of resolution in the frame.

Figure 2 Horizontal Lines of Resolution on a Standard Definition Television Monitor

The first field is recorded, then the second, and these are laid down to tape in a linear fashion. Both fields are considered to be one frame, but it is important to remember that motion will occur from one field to the next, making it crucial that each field play back in the correct order. A television monitor then displays each recorded frame in two passes: It draws every other scan line on its way down (field 1), and when it's done, it goes back to the top 1/60th or 1/50th of a second later and fills in the missing lines to draw field 2 and complete one whole video frame.

Video capture cards deal with interlacing in one of two different ways. You will hear the terms Upper, or Field 2 Dominant, and Lower, or Field 1 Dominant. Field Dominance refers to how the video fields are recorded into a file when going from the analog world of tape to your hard drive. If you remember that video fields come one after another temporally, as if we were playing 60 frames per second, it becomes a little easier to understand.

You may ask, how do we determine which is Field 1 and which is Field 2? While this point is somewhat academic, if you put your monitor into underscan mode (where you see the entire video picture surrounded by a black frame around the edge) a Field 1 can be seen as the field that begins with the first full line of video on the screen and includes every other line going on down to the bottom. Field 2 is the field beginning with the little half line of video way at the top of the screen, (which is in fact located above the first line of Field 1) and includes all the other alternating lines going on down to the bottom. Even though the first line at the top of the monitor is the half-line, it's really a part of field 2.

Figure 3 Distinguishing Between Field 1 and Field 2 on a Standard Definition Monitor

Because there is motion between one field and another, and because different capture cards handle interlacing differently, it's important to render your digital video with the field dominance expected by your hardware. In Final Cut Pro, the options are referred to as Upper (equivalent to Field 2) or Lower (equivalent to Field 1) Field Dominant. Generally, Upper Field First is used by 640x480 systems, while Lower Field First is most common in professional 720x486 and DV 720x480 systems.

DV-NTSC, DV-Pal, and Targa 720x486 NTCS are all Lower Field Dominant. If you're unsure what the field dominance is with your particular hardware, refer to the manual that came with your capture card to find which dominance your Sequence Settings should use.

Figure 4 Changing Field Dominance in the Sequence Settings

Changing the Field Dominance setting is required only when either the video hardware setup is changed, or when rendering a Quicktime movie which is intended for Web or CD playback. Only full frame broadcast video uses interlaced fields, so if you are outputing a QuickTime movie for multimedia use, interlacing should be set to None.

Unfortunately, extreme movement in recorded video will result in a variance between fields that appears as a tearing or rippling in the still image. This tearing will appear also when interlaced material is played back on a computer's progressive scan monitor.

Figure 5 An NTSC Still Frame Before (Left) and After De-interlacing.

Notice the presence of thin lines due to excess movement between fields on the image to the left.

To eliminate these artifacts, especially when video is being rendered as a QuickTime movie for multimedia use, Final Cut Pro includes a De-Interlace filter in the Effects tab of the Browser.

Figure 6 The De-Interlace Filter Located in the Video Folder of the Effects Tab

When clips with extreme motion are rendering with excess artifacts due to interlacing, this filter may be applied to eliminate the problem. The De-Interlace filter strips out one field of video, and interpolates the remaining field to make up the difference. This can result in a slight softening of the image, but this is preferable to the artifact that it removes.

Still frames exported to Photoshop may have the same artifacts. A similarly named De-Interlace filter extists for the same purpose.

Final Cut Pro: Viewing DV Video out of an NTSC or PAL Monitor

When using Final Cut Pro to edit digital video (DV) material, users who want to watch their clips using a video monitor must convert the signal coming out of their Firewire port into either NTSC or PAL video. This article describes how to hook up a video monitor to your computer.
This article has been archived and is no longer updated by Apple.
Final Cut Pro sends video playing off of the timeline to the Firewire port when the following conditions are met:

- The clips you are trying to view must be compressed as DV. (Check Item Properties under the Edit menu to see if the compressor is DV NTSC or PAL)
- View External Video Using Firewire is enabled in the General Preferences tab
- The View>External Video submenu is set to All Frames

To be viewed on an external video monitor, the Firewire output must be converted into a standard NTSC or PAL Composite or S-Video signal. This is accomplished by using a DV camcorder, VTR, or converter box (such as the DA1 from Sony) as an intermediate link between your computer and your video monitor.

When viewing video with the External Video option enabled, the computer's built-in speaker is disabled and the audio will play out of the DV device used for conversion from FireWire. You should also know that this external audio is synchronized specifically to the external video coming out of the same converter, and that there is a delay in the sync between video displayed on the computer monitor and audio coming out of a DV converter box.

Connect your equipment in the following manner:

1. Connect your DV camcorder or VTR to your Apple Macintosh via the Firewire port (also known as the iLink port on some camcorders)

2. Connect your NTSC or PAL video monitor to the composite or S-Video out jack of the camcorder or VTR, and connect the stereo audio output of this same camcorder or VTR to the external speakers or headphones you are planning to listen to while editing.

Figure 1 Connecting a Camcorder to FireWire and a Monitor

3. In the General Preferences tab, go to the View External Video Using pop-up menu and choose Apple FireWire NTSC or PAL as appropriate.

Note: If that option is not listed then the computer is not recognizing the DV device. Double check that your DV device is turned on, that the input is set to DV, and that the Firewire cables are firmly connected.

Figure 2 The General Preferences Tab

Figure 3 Selection Choices for External Video Viewing

Users of PAL DV equipment will want to verify that this menu is set to Apple FireWire PAL

4. Select All Frames from the External Video sub-menu in the View menu.

Figure 4 External Video Selection

Selecting Single Frames prevents video from being output over FireWire until the user presses either F15 or Shift F12.

Note: This article provides information about non-Apple products. Apple, Inc. is not responsible for its content and mention of this product should not be interpreted as a recommendation by Apple. Please contact the vendors for additional information.

Final Cut Pro: Properly Configuring the Sequence Settings

You may find that you are unable to play clips from the timeline without rendering, even though it may be a cuts only edit with no filters or audio mixing applied. This is because the Sequence Settings are incorrectly set. This article discusses how to correct this in the Sequence Settings Panel. This article has been archived and is no longer updated by Apple.
A mistake that new users frequently make is to load a number of video clips into a new sequence which use a codec, frame rate, or frame size that does not match the preset Sequence Settings. For example, if you install Final Cut Pro and select DV as the default setting, then try to go through the tutorial using the supplied clips, you will find that Final Cut Pro will want to render every clip in the sequence before playing from the timeline. This is because the clips in the tutorial are compressed using the Software Preset, while in this situation the Sequence Settings by default are set to DV-NTSC.

The Sequence Settings define which clips will play from the Timeline without rendering. Since you can mix and match virtually any sort of Quicktime video clip in any sequence you choose, (for example, Animation clips with DV clips) it is important to tell Final Cut Pro which clips do not need rendering and which clips do.

You can find out if your clip settings do not match your sequence settings in one of two ways :

1. Select that clip in the Browser and choose Clip from the Analyze Movie sub-menu under the Tools menu shown in Figure 1.

Figure 1 The Tools>Analyze Movie>Clip menu

2. Use the contextual menu in the Browser (Control+click) to select the Item Properties command shown in Figure 2.

Figure 2 The Browser contextual menu showing the Item Properties command

Figure 3 The resulting Item Properties window. Properties used in the Sequence Settings box are highlighted in red.

If the clip settings do not match the currently applied Sequence Settings, then you need only open the Sequence Settings panel, select the preset that matches the type of video material you will be editing from the lower left-hand pop-up menu, and press the Load Preset button.

Figure 4 Selecting the Software Preset in order to go through the Tutorial

If you wish to edit using custom material, perhaps with a different frame size or Quicktime codec, you can easily create a new preset by following these steps:

1. Open Sequence Settings from the Sequence menu.

2. Set the Video Codec, Audio Sample Rate, Frame Size, Field Dominance, and Pixel Aspect Ratio that match those of your video clips.

3. Click the Save as New Preset button.

Figure 5 The Save as New Preset button

4. Give your new preset a name and click Save.

The Sequence Settings box will close. To actually use this new setting, you must reopen the Sequence Settings box, select the new setting from the lower left-hand pop-up menu, and click the Load Preset button.

Note: The timebase can not be changed once a sequence has been created. To change the timebase, you must first delete all sequences currently in the browser.

USB Enabled Macintosh: Troubleshooting Sleep Issues

This article explains how to determine whether a sleep issue is caused by a USB conflict. USB-equipped Macintosh computers may encounter a gray screen when waking from sleep or a "Finder has unexpectedly quit" error when going to sleep in association with certain USB device configurations.

If the computer's screen is black and not gray on wake from sleep, this may be a separate issue for which you should contact Apple Technical Support or an Apple Authorized Service Provider.

This article has been archived and is no longer updated by Apple.
Troubleshooting a sleep issue may necessitate hardware resets of your computer if it fails to respond to keyboard or mouse input. If you are not familiar with the hardware reset procedure for your computer, consult the Emergency Troubleshooting Handbook that was included with your computer.

Steps to isolate the cause of a USB-sleep issue:

1. Verify normal hardware function

To verify that your Macintosh hardware is working normally, disconnect all non-Apple devices, set the Extensions Manager to the Mac OS All extension set, restart the computer and then test sleep behavior. If the computer wakes and sleeps normally, proceed to the next step. If the computer does not sleep and wake properly, reset your PRAM and restart using the Mac OS Software Install or Restore CD that was included with your computer. For further information on resetting PRAM, see "Macintosh: How to Reset PRAM and NVRAM".

Starting up from a CD is achieved by holding down the "c" key during the startup process. A unique desktop pattern containing images of a CD-ROM disc verifies that you have successfully started up from CD. If the hardware functions normally when started up from the CD, this may indicate your system software has become unusable. At this point, consider a clean installation of the Mac OS software. See "Mac OS 8.5, Mac OS 9: Performing a Clean Installation" and 30691, "Mac OS: When and Why to Perform a Clean Installation" for information about clean installations and how to perform them.

If your Macintosh hardware continues to malfunction while started up from CD, you may contact Apple Technical Support or an Apple Authorized Service Provider.

2. Extensions troubleshooting

The first step is to eliminate third-party extension conflicts. For detailed information on using the Extensions Manager, refer to "Mac OS: Extensions Troubleshooting/Extensions Manager Features".

If you removed a folder named Multiprocessing from the Extensions folder, that may be the cause of the sleep issue. For more information, see "Mac OS: Do Not Remove Multiprocessing Folder".

With all added USB devices attached, restart your Macintosh using the Mac OS All extension set. Put the computer to sleep and wake it up a minimum of three times to verify correct operation. If the issue does not persist in this state, then a third-party extension conflict is the cause of the sleep issue. Once you isolate the faulty extension, you may seek an update of that software from the third-party vendor or seek an alternative solution, such as creating different extension sets. If the sleep issue persists when the computer has been started up with the Mac OS All extension set, then continue to the next step.

3. Eliminate conflict with Input Sprockets

Mac OS 9 contains an extension named "InputSprocket Extension." Some third-party USB devices may conflict with this extension. You may determine this by using the Extensions Manager, as in step 1 above. Duplicate the Mac OS All set, name the new set "test set" and disable the InputSprocket Extension. Restart the computer after connecting the third-party USB device that you are testing.

Versions of the Mac OS prior to Mac OS 9 may have a set of Input Sprocket extensions in place of the unified extension. Under the older system, some conflicts may be resolved by disabling individual device extensions. Any Input Sprocket extension may be identified by the unique yellow gear in its icon.

Input Sprockets provide support for USB game controllers. They should not be confused with SoundSprocket or DrawSprocket, which use the same yellow gear icon. If this extension is in conflict with your USB device and you do not use a game controller, disable this extension. Otherwise, create a new extension set within the Extensions Manager with Input Sprockets active.

4. Direct connection versus hub connection

There are two ways to connect a USB device to your USB-equipped Macintosh: directly to a port on your Macintosh computer, or to one of the ports on a USB hub. Apple USB keyboards contain a built-in USB hub, with one port on either side of the keyboard, most frequently used for connecting the Apple USB Mouse. A wide variety of third-party USB hubs are also available. If the issue still has not been isolated, try connecting the affected USB device directly to the logic board and alternatively to the keyboard. In some cases, the behavior may occur only with one of the two connections.

If this process has not isolated the USB-sleep issue in question, you may have a USB device that is not Macintosh compatible, or that requires updated drivers from the manufacturer. If you believe that the USB device in question is Macintosh compatible and has up-to-date software, you should verify that information with the manufacturer, then contact Apple Support.

Mac OS X: Do Not Connect USB Printer to Apple Pro Keyboard

For best results, connect your USB printer directly to your computer, or to a compatible USB hub instead of to the Apple Pro Keyboard.
This article has been archived and is no longer updated by Apple.

Symptom

Connecting a printer to the built-in USB port of an Apple Pro Keyboard may generate an alert message or result in the printer not working correctly.

Solution

Unplug the printer from the keyboard, and connect it to one of the computer's USB ports or a compatible USB hub.

For related information, see technical document 106714, "**Mac OS X: How to Troubleshoot Printing Issues**".
Published Date: Feb 20, 2012

Apple Pro Keyboard: Devices Connected to Hub May Not Work

Some USB (Universal Serial Bus) devices may not work as expected when connected to an Apple Pro Keyboard's USB hub. The computer may also experience System and other errors when a USB device is connected to an Apple Pro Keyboard's hub.
This article has been archived and is no longer updated by Apple.

Symptom

- A USB device does not work as expected when connected to an Apple Pro Keyboard's USB hub, particularly if it draws more power than the hub provides.
- The computer experiences System or other errors when a USB device is connected to an Apple Pro Keyboard's hub.

Solution

Unplug the USB device from the keyboard's hub, and plug it into one of the USB ports on your computer or display.

Notes:

1. The Apple USB keyboard acts as a bus-powered hub. Under the USB Specification you cannot connect two bus-powered hubs together because there won't be enough power for the second hub. See article 43005: "**USB: Hub Description" for further information.**"

2. Apple USB Speakers must be plugged into one of the USB ports on your computer or display because the Apple Pro Keyboard does not provide enough power to make them work.

What to do if an optical mouse pointer moves slowly or doesn‘t move

Learn what the optimal conditions are for optical mice.
This article has been archived and is no longer updated by Apple.
Apple Pro Mouse, Apple Wireless Mouse, and Apple Pro Mouse (2003) are all optical mice. These mice detect movement using an optical sensor on the bottom instead of a ball. An optical sensor needs a surface that has some texture to work effectively. This is because changes in surface texture provide reference points that the optical sensor uses to detect movement, which is translated to pointer movement on the screen.

- Check the Mouse Tracking setting in the Mouse control panel. For more information see article 58651 "**Apple Pro Mouse: Optimal Setting in Mouse Control Panel**".
- Make sure the mouse is on a textured surface such as a table top, or a mouse pad that is a solid color.

The Apple Pro mouse does not work on these surfaces:

- glass, mirrored surfaces, or other glossy materials
- half-tone images, such as mouse pads with pictures

Published Date: Feb 20, 2012

Apple Pro Mouse: Optimal Setting in Mouse Control Panel

This article gives the optimal setting for the Apple Pro mouse in the Mouse control panel.
This article has been archived and is no longer updated by Apple.
If Mouse Tracking is set to Very Slow in the Mouse control panel, you may find that the pointer does not track the mouse's movement, especially during quick motions. If this happens, set Mouse Tracking between Slow and Fast as shown in Figure 1.

Apple Pro Mouse: Optical Technology Overview

This article gives an overview of the optical technology used in the Apple Pro Mouse.

This article has been archived and is no longer updated by Apple.

The optical technology in the Apple Pro Mouse works by beaming a light on the surface beneath the mouse and taking pictures of it. To ensure precise tracking, even during fast movement, the mouse takes 1500 pictures per second. These pictures are analyzed by a high-performance digital signal processor to determine direction and magnitude of movement. These data are communicated back to your computer and are interpreted into smooth pointer action on the screen.

iMac (Summer 2000): How to Distinguish From Earlier iMac Models

This article explains how the iMac (Summer 2000) computer can be distinguished from previous iMac computers.
This article has been archived and is no longer updated by Apple.
The iMac (Summer 2000) product family has four members; iMac, iMac DV, iMac DV+, and the iMac Special Edition. These are the major differences from earlier iMac models:

- Apple Pro Keyboard
- Apple Pro Mouse
- New colors: Indigo, Ruby, Sage, and Snow
- Increased processor speed, up to 500 MHz
- Increased hard disk size, up to 30 GB
- Includes iMovie 2 (DV and Special Edition models only)

Please see article 58658: "**iMac (Summer 2000): What's New and Different**" for a feature comparison between the iMac (Summer 2000) and the previous model.
Published Date: Feb 20, 2012

iMac (Summer 2000): What‘s New and Different

This article provides a table of changes between the iMac (Slot Loading) product family and the iMac (Summer 2000) product family.
This article has been archived and is no longer updated by Apple.
The iMac (Summer 2000) product family has four members; iMac, iMac DV, iMac DV+, and the iMac Special Edition.

Feature	iMac family of 1999		iMac (Summer 2000)			
			iMac	iMac DV	iMac DV+	iMac DV Special Edition
CPU speed	350 or 400 MHz		350 MHz	400 MHz	450 MHz	500 MHz
System bus speed	100 MHz		100 MHz			
Main memory	64 or 128 MB, expandable to 512 MB		64 MB expandable to 1 GB			128 MB expandable to 1 GB
Graphics IC	ATI RAGE 128 VR		ATI RAGE PRO 128			
Graphics memory	8 MB, plus AGP expansion		8 MB	8 MB	8 MB	8 MB
Video Output	Mirrored VGA on DV models		No Mirrored VGA	Mirrored VGA		
Hard disk drive	6, 10, or 13 GB IDE drive		7 GB IDE	10 GB IDE	20 GB IDE	30 GB IDE
CD drive	Slot-load 24x CD-ROM or 4x DVD-ROM drive		Slot-load 24x CD-ROM		4x DVD-ROM	
Data ports	Two USB and FireWire ports on DV models		-Two USB	-Two USB -Two FireWire		
Communications	Ethernet; 56 Kbps modem; opt AirPort		-Ethernet -56 Kbps modem	-Ethernet -56 Kbps modem -AirPort ready		
Sound	Stereo with enhanced AC-3 and surround		Stereo with enhanced AC-3 and surround			
Keyboard	Apple USB Keyboard		Apple Pro Keyboard			
Mouse	Apple USB Mouse		Apple Pro Mouse			
Colors	Grape, Lime, Strawberry, Tangerine, Blueberry, Graphite		Indigo, Ruby, Sage, Graphite, Snow			

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access"**

iMac (Summer 2000): Theater Mode Description and Use

This article describes Theater Mode and the applications that can take advantage of it.
This article has been archived and is no longer updated by Apple.
Theater Mode is built into the iMac (Summer 2000) computer and works with Apple's media playing software: QuickTime Player, iMovie, and Apple DVD Player. It enhances the brightness and contrast of video content that is presented at full screen size. Theater Mode produces a more lifelike image by increasing brightness up to three times and improving color saturation.

The versions of software that enable Theater Mode on the iMac (Summer 2000) are:

- QuickTime version 4.1.2 and later
- Apple DVD Player version 2.2.1 and later
- iMovie 2.0 and later

Theater Mode is enabled automatically in these applications. You may disable Theater Mode in the Monitors control panel as shown in Figure 1.

Figure 1 Theater Mode Preferences

iMac (Summer 2000): Technical Specifications

This article provides the technical specifications for the iMac (Summer 2000) computer. You may find additional information in the Apple Spec database online at http://www.info.apple.com/applespec/applespec.taf.
This article has been archived and is no longer updated by Apple.

Processor and memory

- 350-, 400-, 450- or 500 MHz PowerPC G3 processor
- 512 KB backside level 2 cache
- 100 MHz system bus
- 64 MB or 128 MB of PC100 SDRAM (3.3-volt, 64-bit wide, 168-pin, running at 100 MHz); two DIMM slots support up to 1 GB using 64 MB, 128 MB, 256 MB, or 512 MB DIMMs

Storage

- 7 GB, 10 GB, 20 GB or 30 GB Ultra ATA hard disk drive (See Note 1.)
- iMac and iMac DV - Slot loading 24x-speed (maximum) CD-ROM drive
- iMac DV+ and Special Edition models - Slot loading 4x-speed (maximum) DVD-ROM drive (plays DVD-Video discs; plays CD-ROMs at up to 24x speed)
- Support for external FireWire and USB storage devices (FireWire on DV models only)

Display

- Built-in 38 cm shadow-mask CRT (35 cm diagonal viewable image size); 0.28mm dot pitch
- Onscreen geometry adjustment to keep display images properly aligned throughout its lifetime
- Theater Mode for enhanced brightness of full-screen video
- Flip foot for 17 degree tilt

Graphics support

- ATI RAGE 128 Pro graphics accelerator with 8MB of SDRAM graphics memory and AGP 2X support
- Three crisp, flicker-free screen resolutions: 640 by 480 pixels at 117 Hz, 800 by 600 pixels at 95 Hz, and 1024 by 768 pixels at 75 Hz
- 24-bit true color at all resolutions for displaying millions of colors

Communications

- Built-in 56K V.90 modem (RJ-11 connector) (See Note 2.)
- 10/100 Mbit BASE-T Ethernet (RJ-45 connector)
- Optional 11 Mbps AirPort Card: IEEE 802.11 DSSS compliant (DV models only)(See Note 3.)
- Optional AirPort Base Station containing 56 Kbps modem and 10 Mbit BASE-T Ethernet port (DV models only) (See Note 3.)
- **Peripheral connections**
- Two USB ports (12 Mbps each)
- Two 400 Mbps FireWire (IEEE 1394) ports (DV models only)

Audio

- Integrated high-performance Odyssey audio system from Harman Kardon
- Built-in microphone for speech recognition and audio recording
- Front-mounted dual mini headphone jacks
- Analog audio input and output minijacks; up to 16-bit stereo and 44.1 kHz sampling rate
- Support for external USB audio devices

Video (DV models)

- Standard VGA output port (15-pin mini D-Sub connector)

  -Supports video mirroring: external devices display an image identical to that shown on the built-in display

Keyboard and mouse

- Apple Pro Keyboard with full-size function and navigation keys, audio controls and media-eject key
- Apple Pro Mouse

  -Optical sensor provides precision cursor control

  -Features a comfortable design that allows virtually the entire surface to be clicked

  -Works on a wide variety of surfaces

  -Has no mouse ball to require cleaning

Electrical requirements and agency approvals

- Line voltage: 100 V to 260 V AC Frequency: 47 to 63 Hz, single phase , auto switching
- Maximum continuous power: 150 W
- EPA ENERGY STAR compliant

Environmental requirements

- Operating temperature: 10 C to 35 C
- Storage temperature: -40 C to 47 C
- Relative humidity: 5 percent to 95 percent noncondensing
- Maximum altitude: 0 m to 3000 m

Size and mass

- Height: 381 mm
- Width: 381 mm
- Depth: 435 mm
- Mass: 15.8 kg

Notes

1. For hard drive capacity measurements, 1 GB = 1 billion bytes; actual formatted capacity less.

2. Actual modem speeds lower; speed depends on connection rate and other factors.

3. Wireless Internet access requires AirPort Base Station and Internet access (fees may apply). Some ISPs are not currently compatible with AirPort, including America online. Range may vary with site conditions.

Note: Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access"**

Apple Studio Display LCD (ADC): Information on Touch Switch

The Apple Studio Display LCD (ADC) does not have a typical power button. This article describes the display's touch switch.
This article has been archived and is no longer updated by Apple.
The touch switch on the Apple Studio Display (LCD) is used to turn on, put to sleep, or wake up a Power Mac G4 Cube or Power Mac G4 (Gigabit Ethernet) computer by sensing the touch of your finger. The switch gently flashes when you touch it.

The software launch button located on the front bezel of the Apple Studio Display (LCD) is also sensitive to touch. Touch it to open the Monitors control panel.

Published Date: Feb 20, 2012

Power Mac G4 Cube: Connect USB Speakers to Computer or Display

The Apple USB Speakers included with the Power Mac G4 Cube computer should be connected to one of the USB ports on the computer or the monitor (if it has an Apple Display Connector).
This article has been archived and is no longer updated by Apple.
The Apple USB (Universal Serial Bus) Speakers included with the Power Mac G4 Cube computer require more power to operate than is provided by a typical USB port. The USB ports of the Power Mac G4 Cube computer, and the following monitors with Apple Display Connector (ADC) have been enhanced to provide additional power:

- Apple Cinema Display (ADC)
- Apple Studio Display 17 (ADC)
- Apple Studio Display LCD (ADC)

For this reason, you should only connect the speakers to one of the USB ports on the Power Mac G4 Cube computer, or monitor listed above. You should not connect them to the USB ports of any Apple keyboard, other Apple computer, or third-party USB device.

Note: If you have more USB devices than available ports, a USB hub can be connected to one of the USB ports on the computer. The hub will provide additional USB ports. However, the Apple USB speakers must be connected to the computer or monitor.

Power Mac G4 Cube: How to Eject a CD or DVD Disc

The DVD-ROM drive in the Power Mac G4 Cube computer does not have a mechanical eject button. This article explains how to eject a compact disc or DVD disc that does not appear on the desktop.
This article has been archived and is no longer updated by Apple.
The slot loading DVD-ROM drive in the Power Mac G4 Cube computer does not have a mechanical eject button to eject a disc in the drive.

To eject a disc that does not appear on the desktop:

- restart the computer and hold down the mouse button, or
- press the media eject button above the numeric keypad on the keyboard.

If you can see the disc on the desktop:

- click the disc to select it and choose Put Away from the File menu, or
- drag the disc's icon to the Trash.

Power Mac G4 (Gigabit Ethernet): Applications That Do Not Utilize Dual Processors

This article explains how applications not optimized for dual processors run on a Power Mac G4 (Gigabit Ethernet) computer with dual processors.
This article has been archived and is no longer updated by Apple.
An application that is not optimized to utilize both processors in a Power Mac G4 (Gigabit Ethernet) computer will function just as if it were running on a single processor computer.

Mac OS X, and applications written specifically for Mac OS X, are optimized for dual processing.

Published Date: Feb 20, 2012

Apple DVD Player 2: Application Version Must Match DVDRuntimeLib Version

Opening the Apple DVD Player application results in an error when different versions of the Apple DVD Player application and the DVDRuntimeLib library are installed.
This article has been archived and is no longer updated by Apple.

Symptom

Opening the Apple DVD Player application results in an error:

> "The application 'Apple DVD Player' could not be opened because 'DVDRuntimeLib--GetBounds__7CGWorldsFv' could not be found."

Products affected

- Apple DVD Player 2.0 or later

Solution

Follow the steps listed in the scenarios below.

Scenario 1

In most cases, there is an earlier version of DVDRuntimeLib in the Apple DVD Player folder (within the Applications folder) while the correct version is in the Extensions folder. When the library is in the same folder as the application, it overrides what is in the Extensions folder even though it is an earlier version.

To test for and correct this situation follow these steps:

1. Find and open the Apple DVD Player folder.
2. Find the DVDRuntimeLib file inside the DVD Player folder. If it is not there, move on to scenario 2.
3. Select the DVDRuntimeLib file by clicking it.
4. Choose Get Info from the File menu and note the version.
5. Select the Apple DVD Player application by clicking it once.
6. Choose Get Info from the File menu and note the version.
7. If the version of DVDRuntimeLib file is earlier than the version of the Apple DVD Player application, drag DVDRuntimeLib to the Trash.
8. Open the Apple DVD Player application.

Scenario 2

If you didn't find the DVDRuntimeLib file in the Apple DVD Player folder, then it is possible that there is an older version in the Extensions folder.

1. Open the Extensions folder located in the System Folder.
2. Select the DVDRuntimeLib file by clicking it.
3. Choose Get Info from the File menu and note the version.
4. Compare the version of the DVDRuntimeLib file to the version of Apple DVD Player.

If the versions are different, follow these steps remove and reinstall the Apple DVD Player software:

1. Drag the following files and folders to the Trash:

Apple DVD Player folder (in the Applications folder)
DVD Navigation Manager (in the Extensions folder)
DVD Region Manager (in the Extensions folder)
DVDRuntimeLib (in the Extensions folder)
DVD AutoLauncher (if present, in the Extensions folder)

2. Insert the Software Install CD that came with your computer (not the Restore CD).

3. Double-click the Apple DVD Update located in this path:
Software Installers
System Software
Apple DVD Software
Apple DVD Update

4. Follow the instructions to install the software.

5. Restart the computer.

6. Open the Software Update control panel and check if there are any DVD updates available for your computer.

Power Mac G4 Cube: Mold Lines in Enclosure Plastics Are Normal

This article explains the surface lines on the plastic enclosure of the Power Mac G4 Cube computer.

This article has been archived and is no longer updated by Apple.
These lines are called mold lines, and occur when the enclosure is manufactured. These lines may appear on the enclosure's inside and outside surfaces. Mold lines are not cracks, and do not represent a weakness or defect in the plastic.

Power Mac G4 (Gigabit Ethernet): Apple Hardware Test 1.0 Error ata4/1/2

When running Apple Hardware Test (AHT) 1.0 on a Power Mac G4 (Gigabit Ethernet) computer without an ATA (also known as IDE) hard drive installed, AHT generates an "ata4/1/2" error and stops testing.

This article has been archived and is no longer updated by Apple.

Symptom

Apple Hardware Test (AHT) displays error "ata4/1/2" and stops testing.

Solution

This issue has been resolved in version 1.0.1 of Apple Hardware Test for Power Mac G4 (Gigabit Ethernet) computers. Phone Apple technical support to request an updated version.

Published Date: Feb 20, 2012

Power Mac G4 (Gigabit Ethernet): CD/DVD Disc Does Not Appear on Desktop

This article provides troubleshooting information when a CD/DVD disc does not appear on the desktop of a Power Mac G4 (Gigabit Ethernet) computer.

This article has been archived and is no longer updated by Apple.

Symptom

A CD or DVD disc does not appear on the desktop.

Solution

Make sure the DVD drive's ribbon cable is installed securely in the drive by following these steps:

1. Shut down the computer.
2. Remove the power cord.
3. Open the door on the computer by pulling the latch.
4. Locate the DVD-ROM drive.
5. Locate the last connector on the ribbon cable that plugs into the back of the DVD-ROM drive.
6. Plug that connector into the drive's connector.
7. Push on the ribbon cable's connector to ensure a snug connection.
8. Close the computer's door.
9. Plug in the power cord.
10. Turn on the computer.
11. Insert a disc into the DVD-ROM drive and verify the disc appears on the desktop.
12. If the disc does not appear on the desktop, refer to article: 58382: "**Troubleshooting a CD-ROM or DVD-ROM Disc That Does Not Appear on the Desktop**".

Refer to the following URL for detailed instructions on the above process:

Power Mac G4: Second ATI RAGE 128 PCI Card Affects Low-Power Mode

Power Mac G4 computers with the optional second ATI RAGE 128 PCI video card installed always have the fan running even while in sleep mode.

This article has been archived and is no longer updated by Apple.

Symptom

The fan keeps running even when the computer is in sleep.

Solution

As the Power Mac G4 Read Me file notes, some PCI cards are not compatible with low-power mode.

The ATI RAGE 128 PCI card option, available only as a configure-to-order option from The Apple Store, prevents the computer from entering low-power mode when it is in sleep. The system fan continues to run while the computer is in sleep mode.

No upgrade is available to allow this card to enter low-power mode.

Apple DVD Player: Type 1 or Type 2 Error When First Opened

This article describes a situation where the Apple DVD Player application generates an error the first time it is opened after running the Setup Assistant application on a new computer.
This article has been archived and is no longer updated by Apple.

Symptom

After opening Apple DVD Player, an alert box appears, which says that an error of Type 1 or Type 2 occurred. This occurs only the first time you turn on a new computer, complete the Setup Assistant, and open the Apple DVD Player application. It does not occur whenever you restart the computer later.

Solution

Restart the computer.

Notes:

1. The parenthetical product description (Summer 2000) refers to the summer of the Northern Hemisphere.

About iMovie 2.0.1

This article contains the Read Me from iMovie 2.0.1.
This article has been archived and is no longer updated by Apple.
* About iMovie 2.0.1

Welcome to iMovie 2.0.1, an application that integrates digital video (DV) capture, scene editing, titling, transitions and effects, and audio to create broadcast-quality movies. This version of iMovie 2.0.1 does not include the Tutorial media that usually accompanies the CD version.

For the latest news and information about iMovie, along with a list of qualified camcorders and DV devices, go to the iMovie World Wide Web site at http://www.apple.com/imovie

The following topics are covered in this document:

System requirements

Installing iMovie

Using iMovie

System Requirements

- A Macintosh computer with a G3 (or later) 300 MHz or faster processor and a built-in FireWire port.
- A CD or DVD drive
- At least 64 megabytes (MB) of random-access memory (RAM). (128 MB of RAM is recommended.) If running with 64 MB you must turn Virtual Memory ON in the Memory Control panel in order to launch iMovie.
- 200 MB of available (unused) hard disk space (4 gigabytes are recommended. For example, 5 minutes of imported digital video requires about 1 gigabyte of disk space.)
- A monitor that supports 800 x 600 resolution (1024 x 768 is recommended) and thousands of colors (millions of colors is recommended)
- Mac OS 9.0.4 or later
- QuickTime 4.1.2 or later
- FireWire 2.4 or later (FireWire Support and Enabler extensions)

Other Requirements

- A digital video (DV) device, such as a camcorder or deck, with a FireWire, IEEE 1394, or iLink port
- A 4-pin-to-6-pin FireWire cable (for use with DV camcorders)

To view your movies with a television and/or VCR, you also need cables to connect your DV device to a VCR or television.

Installing or Reinstalling iMovie

Before you install:

1. If you've used iMovie on your computer before, make sure that any iMovie projects you want to save are moved from the iMovie folder to a different location on your hard disk.

2. Delete any older versions of iMovie by dragging the iMovie application folder to the Trash icon.

To install iMovie: Double-click the iMovie Installer icon and follow the onscreen instructions. The application and its components will be placed in a folder named iMovie, on the main level of your hard disk.

Note: If iMovie was pre-installed on your computer in the Applications folder, the Installer will create an iMovie folder on the main level of your hard disk. To restore iMovie to its original location, drag the new iMovie folder to the Applications folder on your hard disk.

Using iMovie

To learn how to use iMovie see the iMovie online help. In iMovie, choose iMovie Help from the Help menu.

For late breaking news and troubleshooting please refer to appropriate topics in iMovie Help.

Plug in any required devices before opening iMovie. Do not unplug devices while iMovie is open.

Mac OS X Server: Installation Appears Stopped at Erasing Disk

This article describes what to do when the Mac OS X Server installation application appears to stop when erasing the disk.
This article has been archived and is no longer updated by Apple.

Symptom

The installation process appears to be stopped while the disk is being erased. The progress bar does not move.

Solution

There is no user feedback while the disk is being erased so this is normal behavior. The time it takes to erase the disk depends upon the size of the UFS partition being created. Times over 15 minutes for 20 GB partitions are normal.

If visual feedback is desired, starting up in verbose mode causes the system to display the backup superblocks that are created. To do this, follow the steps below:

1. Start up from the installation CD into Mac OS 9.
2. Run the Mac OS X Server installer.
3. Click the Restart button at the end of this process.
4. Hold down the 'V' key to start up in verbose mode.

iMac: Sound Output Ports Specifications

This provides the specifications for the sound output ports of an iMac computer.
This article has been archived and is no longer updated by Apple.

Sound Output Port

The sound output port is a 3.5 mm miniphone jack located on the I/O panel on the right side of the computer. It accepts a stereo miniplug-to-RCA cable adapter for connecting stereo equipment to the computer.

The sound output port provides line level output with the following electrical characteristics:

- output impedance: 65 Ω
- maximum level: 1.4 V nominal (root mean square), 4.0 V peak-to-peak

Headphone Jacks

Two headphone jacks are located on the front of the computer next to the left speaker. Each jack provides enough current to drive a pair of low-impedance headphones.

The headphone jacks have the following electrical characteristics:

- output impedance: 65 Ω
- maximum level: 1.0 V (root mean square), 2.8 V peak-to-peak

The recommended minimum headphone impedance is 32 Ω. Headphones with lower impedance can be used, but with some degradation in performance.

Sound Specifications

The frequency response of the sound circuits, not including the microphone and speakers, is within plus or minus 1 dB from 20 Hz to 20 kHz.

Total harmonic distortion plus noise (THD+N)

THD+N as a percentage of full scale are as follows:

Connector and level THD+N

- line input 0.03 percent
- line output, open circuit 0.03 percent
- headphone jack, open circuit 0.03 percent
- headphone jack, 32 Ω headphones 0.5 percent

Signal-to-noise ratios (SNR)

The signal-to-noise ratios (SNR) for various inputs and outputs are shown below. The values shown are unweighted. Values with weighting would be approximately 8 dB higher.

SNR specifications

Connector signal-to-noise ratio

- microphone 65 dB
- line output 85 dB
- headphone jacks 85 dB
- line input 85 dB
- internal CD or DVD 85 dB

Published Date: Feb 20, 2012

iMac: Sound Input Port Specifications

This article provides specifications for the sound input port of an iMac computer.
This article has been archived and is no longer updated by Apple.
The sound input port is a 3.5 mm miniphone jack located on the I/O panel on the right side of the computer. The sound input port accepts line-level stereo signals, or an Apple PlainTalk microphone. It also accepts a stereo miniplug-to-RCA cable adapter for connecting stereo equipment to the computer.

The sound input jack has the following electrical characteristics:

- input impedance: nominal 2 kΩ
- maximum level: 1 V nominal (root mean square), 2.8 V peak-to-peak

For information on the PlainTalk microphone, refer to article 15884: "**PlainTalk Microphone: Specifications**".

Power Mac G4 (Digital Audio): What‘s New and Different

This article describes the new features of the Power Mac G4 (Digital Audio) computer.
This article has been archived and is no longer updated by Apple.
The Power Mac G4 (Digital Audio) computer has these differences from earlier Power Mac G4 models:

Microprocessor clock speed: The microprocessor clock frequency is either 466 or 533 MHz.

Memory caches: The G4 microprocessor in the 466 MHz and 533 MHz configurations has an external 1 MB level 2 cache.

Bus clock speed: The system bus and the memory bus have a clock frequency of 133 MHz.

PCI card expansion slots: The Power Mac G4 computer has four expansion slots for PCI cards in addition to the AGP video card slot.

Memory Expansion slots: There are three slots for PC-133 memory DIMMs. Refer to article 58763 "**Power Mac G4 (Digital Audio): Requires PC-133 Memory**" for more information.

Optical drive: The computer comes with a built-in optical media drive, either CD-RW or DVD-R/CD-RW. A DVD-ROM drive is also available.

Zip drive: All configurations can accept an optional 250 MB ATAPI Zip drive.

Graphics card: The graphics card in the AGP-4x slot is either an ATI RAGE 128 Pro or NVIDIA GeForce2 MX.

Sound: The computer has a built-in speaker, a headphone sound output port, and an Apple speaker sound output port. More information is available in article 58764: "**Power Mac G4 (Digital Audio): Sound Output Ports**".

Published Date: Oct 7, 2016

Power Mac G4 (Digital Audio): Differences Between Models

This article differentiates between the various configurations of the Power Mac G4 (Digital Audio) computer.
This article has been archived and is no longer updated by Apple.

	M7627LL/A	M7688LL/A	M7945LL/A	M7681LL/A
Processor	466 MHz PowerPC G4	533 MHz PowerPC G4	667 MHz PowerPC G4	733 MHz PowerPC G4
On-chip cache	-	-	256K L2 at 667 MHz	256K L2 at 733 MHz
Backside cache	1 MB L2 at 233 MHz	1 MB L2 at 266 MHz	1 MB L3 at 167 MHz	1 MB L3 at 183 MHz
Memory (PC-133 SDRAM)	128 MB	128 MB	256 MB	256 MB
Hard disk drive	30 GB (5400 rpm)	40 GB (7200 rpm)	60 GB (7200 rpm)	60 GB (7200 rpm)
Graphics support	ATI RAGE 128 Pro 16 MB of SDRAM	NVIDIA GeForce2 MX 32 MB of SDRAM	NVIDIA GeForce2 MX 32 MB of SDRAM	NVIDIA GeForce2 MX 32 MB of SDRAM
Optical drive	CD-RW	CD-RW	CD-RW	DVD-R/CD-RW
FireWire	Two 400 Mbps ports	Two 400 Mbps ports	Two 400 Mbps ports	Two 400 Mbps ports
USB	Two ports (12 Mbps each)	Two ports (12 Mbps each)	Two ports (12 Mbps each)	Two ports (12 Mbps each)
PCI slots	Four slots	Four slots	Four slots	Four slots
Ethernet	10/100/1000BASE-T	10/100/1000BASE-T	10/100/1000BASE-T	10/100/1000BASE-T
Wireless networking	AirPort Ready	AirPort Ready	AirPort Ready	AirPort Ready
Modem	56K V.90	56K V.90	56K V.90	56K V.90

Note: Wireless internet access requires an internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590. "**AirPort: Requirements for Wireless Internet Access".**

Disc Burner 1.x Software Records Single Session Only

This article describes an issue with the Disc Burner 1.x CD-RW software installed on Apple products containing a CD-RW drive such as the Power Mac G4 (Digital Audio) and iMac (Early 2001) computers.

This article has been archived and is no longer updated by Apple.

Each write to a recordable media, such as CD-RW, is called a session. Single session is the ability to write to a disc once. Multiple session allows you to write to the disc multiple times without reformatting.

Disc Burner 1.x will not rewrite to a CD-RW disc without first reformatting the disc. Once data has been written to the disc, no further writes are allowed until the disc has been reformatted.

Published Date: Oct 7, 2016

Power Mac G4 (Digital Audio): Digital Sound System Information

This article discusses the digital sound system used in the Power Mac G4 (Digital Audio) computer.
This article has been archived and is no longer updated by Apple.
Like other Macintosh computers, the sound circuitry and system software can create and record sounds digitally and play the sounds through the speaker inside the computer, and send audio signals out through the headphone and Apple Speaker sound output ports.

All audio is handled digitally inside the computer, including audio data from the CD or DVD drive and from devices connected to the USB and FireWire ports. Sound data is converted to analog form only for output to the internal speaker and the headphone sound output port.

The sound circuitry handles audio data as 44.1 kHz 16-bit samples. If audio data sampled at a lower rate on another computer is played as output, the Sound Manager transparently upsamples the data to 44.1 kHz prior to sending the audio data to the sound circuitry.
Published Date: Oct 7, 2016

Mac OS 9.1: Error When Initializing CD-R/CD-RW Disc

Disc Burner software is required to initialize a CD-R/CD-RW disc. If Disc Burner software is not installed on the computer, inserting a CD-R or CD-RW disc and choosing an option to initialize it results in an alert box with an error message or an unresponsive system.

This article has been archived and is no longer updated by Apple.

Symptom

Inserting an unformatted CD-R or CD-RW disc and then choosing an option to initialize it results in an alert box with an error message or an unresponsive system.

Solution

Use the Software Update control panel to download and install Disc Burner software on the computer. Or, use the Software Restore CD that came with your computer to Restore your original hard drive contents.

Note: Some Power Mac G4 (Digital Audio) computers do not include Disc Burner software.

For additional information, refer to article 75106: "**About Disc Burner 1.0.1 and Software**"

Published Date: Oct 7, 2016

Disc Burner 1.0: Requires Factory-Installed Disc Drive

Disc Burner 1.0 software requires that your computer have an internal disc drive that is able to write to a disc.

This article has been archived and is no longer updated by Apple.

Symptom

You've downloaded and installed the Disc Burner and iTunes software, but you can't record onto a disc.

Solution

1. Disc Burner 1.0 and iTunes 1.0 do not work with third-party disc drives. Make sure your computer has a factory-installed internal disc drive that is able to record to a disc. (Not all computers have this kind of drive.)

2. Make sure the Authoring Support system extension is installed and turn on in the Extensions Manager control panel. You might also make sure that the Authoring Support Files folder is also installed in the Extensions folder.

3. Use Disc Burner 1.0.1 and iTunes 1.1, which work with third-party disc drives.

Published Date: Oct 7, 2016

Power Mac G4 (Digital Audio/Gigabit Ethernet): Power Supply Replacement Instructions

This article provides replacement instructions for the Power Mac G4 (Digital Audio/Gigabit Ethernet) power supply.
This article has been archived and is no longer updated by Apple.
Be sure to follow the instructions in this sheet carefully. Failure to follow these instructions could result in damage to your equipment and may void your warranty.

Replacing the power supply requires five basic steps:

1. Turn off the computer.
2. Open the computer.
3. Remove the installed power supply.
4. Install the replacement power supply.
5. Close the computer.

Note: HTML/QuickTime video versions of the instructions are available at http://www.info.apple.com/installparts.

Tools Required

The following tools are required for this procedure:

- Phillips screwdriver
- Allen wrench

Electrostatic Discharge (ESD)

Static electricity, a normal and natural phenomenon, builds up on your body as you walk around. You experience an electrostatic discharge (ESD) when you touch an object and feel a spark. ESD can cause damage to the internal components of your computer. Avoid walking around while performing this procedure, and follow the instructions carefully when you are asked to discharge static electricity.

Opening the Computer

Warning: Always turn off your computer before opening it to avoid damaging its internal components.

1. Place your computer on a clean, flat surface.

2. If you think your computer is in sleep, press the power button on the front of the computer to wake it.

3. Shut down your computer by opening the Special menu and choosing Shut Down. Then wait five minutes for the computer's internal components to cool down.

4. If you attached a security cable through the computer's lockable cover latch, remove the cable.

5. Unplug all other cables from the computer except the power cord.

6. Touch the metal PCI access covers on the back of the computer.

Important: To avoid electrostatic discharge, always ground yourself by touching the port access covers before you touch any parts or install any components inside the computer. To avoid static electricity building back up in your body, do not walk around the room until you have completed your installation and closed the computer.

7. Unplug the power cord.

8. Lift the latch on the right side access panel.

9. Gently lower the access panel until it lies flat. To avoid scratching the case, lower the panel onto a soft, clean cloth.

Warning: If you see any lights glowing on the main logic board, the computer has not been shut down. Close the side access panel and shut down the computer before proceeding.

Removing the Installed Power Supply

1. From inside the computer, push the CD/DVD/Zip bezel tabs forward to release the bezel from the front panel.

2. Disconnect the bezel from the slots on the left side of the front panel and remove the bezel from the computer.

3. Remove the two screws on the drive carrier.

4. Move the CD/DVD/Zip drive carrier forward 1 inch.

5. Disconnect the power-to-fan connector.

6. Disconnect the following power cables:

- cables P6 and P7 from the CD/DVD and Zip drives (if installed)
- main power cable from the logic board
- power cable(s) from any hard drives

7. Using a 2.5 mm Allen wrench, remove the three screws on the rear vented panel.

8. Remove the Phillips screw that attaches the power supply to the power supply shelf.

9. If the opening for the cables in the power supply shelf extends across the width of the shelf, slide the power supply toward the front of the computer. Then maneuver the power supply and its cables out of the computer.

10. If the opening in the power supply shelf does not extend across the width of the shelf, remove the two screws that attach the fan bracket to the chassis.

11. Pull the bracket straight down to release it from the two holding tabs on the underside of the shelf, and remove the bracket from the computer.

12. Slide the power supply toward the front of the computer. Then maneuver the power supply and its cables out of the chassis.

Installing the Replacement Power Supply

1. Transfer the power supply bracket from the original power supply to the new power supply.

2. Position the new power supply in the power supply shelf and thread the main and hard drive power cables through the opening in the shelf.

3. If you removed the fan bracket, reinstall it and the two mounting screws. Make sure the slots in the top of the bracket engage with the two holding tabs on the underside of the power supply shelf. Otherwise, the screws that attach the bracket to the chassis will not align properly.

4. Reinstall the three Allen screws on the rear panel.

5. Reconnect the following power cables:

- cables P6 and P7 to the CD/DVD and Zip drives
- main power cable to the logic board
- power cable(s) to any hard drives

6. Reconnect the power-to-fan connector.

7. Move the CD/DVD/Zip drive carrier back so the carrier front is flush with the front panel.

8. Reinstall the two drive carrier mounting screws.

9. Position the CD/DVD/Zip bezel in the slots in the left side of the front panel, insert the bezel tabs into the slots on the right side of the panel, and snap the bezel into place.

Replacement Note: To avoid damaging the computer, make sure the power supply voltage switch is on the correct setting (115 V in US).

Closing the Computer

1. Raise the side access panel, lift the latch, and press the panel against the case until it snaps securely into place.

2. Reconnect all cables and restart your computer.

Warning: Never turn on your computer unless all of its internal and external parts are in place and it is closed. Operating the computer when it is open or missing parts can damage your computer or cause injury.

Power Mac G4 (Digital Audio): CD-RW Drive Tray Continually Opens

The CD-RW drive tray in some Power Mac G4 (Digital Audio) computers may continually eject by itself. This article provides a solution to this issue.
This article has been archived and is no longer updated by Apple.

Symptom

As soon as computer is started up, the CD-RW drive tray ejects. After closing the tray, it immediately opens again.

Solution

1. Open the CD-RW door with your finger, as shown in Figure 1.

Figure 1 CD-RW door

2. Locate the CD-RW eject button on the lower right side of the drive face, as shown in Figure 2.

Figure 2 CD-RW drive face

3. Check for tape over the eject button.
4. Remove any tape if found.

If the drive tray continues to open by itself, disconnect the Apple Pro Keyboard, which may have a failing Eject button. If you have connected a third-party mouse or trackball you should disconnect it, too.

Apple Hardware Test for Power Mac G4 Cube version 1.1, Read Me

This article comprises the Apple Hardware Test for Power Mac G4 Cube version 1.1 is distributed only with the G4 Cube, January, 2001; it will not work with any other computer.
This article has been archived and is no longer updated by Apple.

About Apple Hardware Test

Apple Hardware Test is a diagnostic tool for detecting problems with your computer's internal hardware components such as the logic board, memory, modem, video RAM, and Apple's AirPort card. It does not check externally connected hardware components such as USB drives or FireWire devices; it does not check non-Apple devices such as PCI cards from other vendors.

Before using Apple Hardware Test, disconnect external devices (excluding Apple keyboard, mouse, display, and speakers), and remove any non-Apple cards that were not included in Apple's shipping configuration of your system.

Apple Hardware Test does not check your computer for problems with the Operating System (OS) or other software related problems such as application or extension conflicts.

To use the Apple Hardware Test CD, restart your computer while holding down the C key until the "Loading..." icon appears, then you may release the C key. Loading will take approximately 45 seconds. Apple Hardware Test's main screen will appear. Follow the on-screen instructions and recommendations.

Apple Hardware Test for Power Mac G4 Cube version 1.1 is distributed only with the G4 Cube, and will not work with any other computer.

If you suspect your computer has a hardware problem, the information provided by Apple Hardware Test can help identify the problem. If Apple Hardware Test detects a problem, an error code will be displayed. Please make a note of the error code before pursuing support options. If no hardware failure is detected, the problem may be software related.

Known issues

Apple Hardware Test cannot be used when a mouse is directly connected to the USB port on the display or on the G4 Cube. Please connect the mouse to a USB keyboard.

It may take significantly more time than indicated (on the Apple Hardware Test screen) to run the Extended Test on a G4 Cube with more than 512 MB of RAM installed; durations between 18 and 20 minutes have been observed.

AppleCare Recommendations

Apple Hardware Test is one of several tools and procedures you can use when your Macintosh is having trouble. Here are some steps you can follow to help resolve problems. Please back up your data before performing any of these steps.

1. Turn the computer off and on.
You can often eliminate problems by selecting the "Shut Down" option from the Special menu to fully shut down the CPU, then restarting your system

2. Check cables, peripherals, and user controls.
Shut down your computer. Then disconnect and reconnect all cables. Disconnect all peripherals (such as printers, scanners, cameras and external mass storage devices) to see if they are causing conflicts with your system. Adjust user controls on your monitors and other peripherals to see if this helps

3. Turn off system extensions.
Restart your system while holding down the Shift key until the following message appears: "Extensions disabled." Then release the key. This turns off system extensions that often cause conflicts. If this solves your problem, use the Extensions Manager to turn off extensions that may be causing the problem.

4. Rebuild the desktop.
Restart your system while holding down the Option and Command keys. Click OK when asked if you want to rebuild the desktop.

5. Start up from the system CD that shipped with your computer.
Start your system from the system CD by holding down the C key until you see the smiling Mac face. If the system works properly when started (booted) from the system CD, you can generally assume that the problem relates to the software which is installed on your computer.

6. Start up from the Apple Hardware Test CD, and run the Quick and Extended Tests.
If the system does not work properly when started (booted) from a known-good system CD (Step 5), you can generally assume that the

problem relates to your computer's hardware components. The Apple Hardware Test CD can often be used to start up your computer even if it will not boot into the Mac OS. If Apple HardwareTest passes both the Quick Test and the Extended Test, the problem may be software related. If Apple Hardware Test detects a problem, make a note of the error code and contact Apple (Step 9).

7. Refer to Mac OS Help Center and the Internet for assistance.
The Mac OS help system under the Help menu in the Finder includes a wealth of technical information. Apple's Knowledge Base, and other resources for technical help and support are available 24 hours a day at www.apple.com/support.

8. Re-install Mac OS.
In many cases, a clean installation of the Mac OS will fix recurring problems. Back up any data before reinstalling. Please follow the instructions in your user manual or on your Restore CD to reinstall the Mac OS.

9. Contact Apple Service and Support for assistance.
If these steps don't help resolve the problem, please review the service and support material that accompanied your computer for information on how to contact AppleCare for further assistance. Apple reserves the right to change telephone hours at any time.

Power Mac G4 Cube (CD-RW): Technical Specifications

This article provides the technical specifications for the Power Mac G4 Cube (CD-RW) introduced in February, 2001.
This article has been archived and is no longer updated by Apple.

Processor

- 450-MHz PowerPC G4 processor
- Velocity Engine vector processing unit
- Full 128-bit internal memory data paths
- Powerful floating-point unit supporting single-cycle, double-precision calculations
- Data stream prefetching operations supporting four simultaneous 32-bit streams
- 1MB backside level 2 cache running at 225 MHz
- 100-MHz system bus supporting up to 800-MBps data throughput

Memory

- 128MB of PC100 SDRAM
- Three DIMM slots support up to 1.5GB of PC100 SDRAM using up to 1.38-inch (35-mm) DIMMs, as follows:

  -32MB, 64MB, or 128MB DIMMs (64-bit-wide, 64-Mbit technology)

  -128MB or 256MB DIMMs (64-bit-wide, 128-Mbit technology)

  -512MB DIMMs (64-bit-wide, 256-Mbit technology)

Storage

- 20GB 5400-rpm Ultra ATA/66 hard disk drive
- Slot-loading CD-RW drive
- Support for external FireWire and USB storage devices

Graphics support

- ATI RAGE 128 Pro graphics card with 16MB of SDRAM graphics memory installed in a dedicated AGP 2X graphics slot
- Support for up to 1920-by-1200-pixel resolution at 32 bits per pixel (millions of colors)
- Apple Display Connector (ADC); carries analog and digital video, USB, and power
- 15-pin mini D-Sub VGA connector

Communications

- 10/100BASE-T Ethernet connector (RJ-45)
- Built-in 56K V.90 modem card
- Optional 11-Mbps AirPort Card; IEEE 802.11 DSSS compliant
- Optional AirPort Base Station containing 56K modem and 10BASE-T Ethernet port

Peripheral connections

- Two 400-Mbps FireWire (IEEE 1394) ports, 12W total power; includes 4-pin-to-6-pin FireWire cable for connecting DV camera
- Two USB ports (12 Mbps each)

Speakers and audio

- Digital amplifier and speakers with Harman Kardon audio technology

  -Total power output: 20W

  -Frequency response: 80 Hz to 20 kHz

  -Single USB cable carries both power and audio; plugs into USB port on the G4 Cube or a display with ADC

  -Removable covers protect speaker cones

-Digital amplifier module includes locking loop for theft prevention and minijack for connecting stereo headphones

- Support for external third-party FireWire and USB digital audio peripherals such as microphones, speakers, and MIDI devices

Keyboard and mouse

- Apple Pro Keyboard with full-size function and navigation keys, audio controls, and media-eject key
- Apple Pro Mouse with optical sensor for precision cursor control

Electrical requirements and agency approvals

- Line voltage: 115V AC (90V to 132V AC) or 230V AC (180V to 264V AC)
- Frequency: 47 to 63 Hz, single phase
- Maximum continuous power: 205W
- U.S. EPA ENERGY STAR compliant

Environmental requirements

- Operating temperature: 50 to 95 degrees F (10 to 35 degrees C)
- Storage temperature: -40 to 116 degrees F(-40 to 47 degrees C)
- Relative humidity: 5 to 95 percent noncondensing
- Altitude: 0 to 10,000 feet

Size and weight

- Height: 9.8 inches (24.8 cm)
- Width: 7.7 inches (19.5 cm)
- Depth: 7.7 inches (19.5 cm)
- Weight: Approximately 14 pounds (6.4 kg)

Note: Wireless internet access requires an internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590. "**AirPort: Requirements for Wireless Internet Access".**

Power Mac G4 Cube: Troubleshooting: Power-On Light Self Test

This article explains how to interpret the Power Mac G4 Cube computer's power-on light flash sequence at system startup.
This article has been archived and is no longer updated by Apple.
The ROM of the Power Mac G4 Cube computer contains a self test that runs whenever the computer is turned on after having been shut down. It does not run if the computer is only restarted. If a potential issue is detected during the test, you will not hear a startup sound; instead, you will see the power-on light flash two, three, or four times.

Note: In this case, a flash is considered to be 1/4 second or 250 ms or greater in length.

Caution: To remove or reinstall the core from the enclosure, to install or reinstall memory, to understand and follow the Electrostatic Discharge (ESD) procedures and the general set up of the cube, please refer to the following materials:

- "Working Inside Your Computer" chapter, "Installing Memory" section in the "About the Power Mac G4 Cube" owners manual
- Installation Instructions web page on the Apple Support web site located at: http://www.info.apple.com/support/cip/g4cubecip.html

This article covers repair procedures for authorized service providers on selected Apple products, but we have published them in the Knowledge Base for the general public for educational purposes. At this time, there are a limited number of repairs that customers can perform. These are documented under the customer installable parts program at http://www.info.apple.com/installparts/.

If you have not been authorized to perform these procedures, please contact Apple (800-APL-CARE in the United States) or your local authorized service provider to schedule a repair.

If you do not hear a startup sound, the power-on light will flash as explained below:

Two Flashes: No memory is installed or detected.

If memory is installed, ensure it is seated properly, as follows:
1. Shut down the computer by holding down the power button (about 5 sec.) until it shuts off. Then disconnect the power cord from the computer.
2. Remove the computer core.
3. Rotate the core so you can see the memory.
4. Eject and reinsert the memory to ensure the memory is seated properly.
5. After reseating the memory, replace the core in the enclosure.
6. Plug in all the cables, and turn on the computer.
7. If the light still flashes, contact Apple Support for assistance.

If no memory is installed, install compatible memory, as follows:
1. Shut down the computer by holding down the power button (about 5 sec.) until it shuts off. Then remove the power cord from the computer.
2. Remove the computer core.
3. Rotate the core so you can see the memory slots.
4. Install compatible memory. Refer to the Power Mac G4 Cube owner's manual, which discusses the type of memory that is compatible with the computer. You can also refer to http://www.apple.com/guide/, and article 58776: "**Power Mac G4 Cube: Memory Specifications**".
5. After installing memory, replace the core in the enclosure.
6. Plug in all the cables, and turn on the computer.
7. If the light still flashes, contact Apple Support for assistance.

Three Flashes: Incompatible memory types are installed (for example both SDRAM and EDO installed).

Install compatible memory, as follows:
1. Shut down the computer by holding down the power button (about 5 sec.) until it shuts off. Then remove the power cord from the computer.
2. Remove the computer core.
3. Rotate the core so you can see the memory slots.
4. Install compatible memory. Refer to the Power Mac G4 Cube owner's manual which discusses the type of memory that is compatible with the computer. You can also refer to http://www.apple.com/guide/, and article 58776: "**Power Mac G4 Cube: Memory Specifications**".
5. After installing memory, replace the core in the enclosure.
6. Plug in all the cables, and turn on the computer.
7. If the light still flashes, contact Apple Support for assistance.

Four Flashes: No memory banks passed memory testing.

Either the memory or the memory slots need replacement, as follows:
1. Shut down the computer by holding down the power button (about 5 sec.) until it shuts off. Then remove the power cord from the computer.

2. Remove the computer core.
3. Rotate the core so you can see the memory.
4. Remove all the memory.
5. Check to make sure there are no bent pins in the memory slots.
6. If there are bent pins, contact Apple Support for assistance.
7. This step covers a repair procedure for Apple Authorized Service Providers. At this time, there are a limited number of repairs that a customer can perform and these are covered under the customer installable parts program http://www.info.apple.com/installparts/. If you have not been authorized to perform these procedures, please contact Apple (800-APL-CARE in the United States) or your local authorized service provider to schedule a repair.

If there are no bent pins, reset the logic board as follows:
a. Remove the video card and video riser card from the logic board.
b. Replace the video riser card back in its slot.
c. Locate the reset button (S1) on the logic board, shown in Figure 1.

Figure 1 Power Mac G4 Cube logic board

d. Wait 10 seconds, then press S1 once. Do **NOT** press the reset button a second time.

8. Reinstall memory, and replace the core in the enclosure.
9. Plug in all the cables, and turn on the computer.
10. If the light still flashes, replace the memory modules.
11. If the light still flashes, call Apple Support for further assistance

Apple DVD Player: Distorted Video When Played Through VCR

The Macrovision copy protection included with most commercial DVD videos can cause distortion, including varying brightness, when the Macintosh video output is connected to a television through a VCR.

This article has been archived and is no longer updated by Apple.

Symptom

The video for the movie may appear to get brighter and then darker while the movie is playing. Sometimes colors appear to be mismatched

Solution

There is nothing wrong with the computer or the DVD.

Macrovision copy protection is designed to deter unauthorized recording of copyrighted materials. As a part of the Macrovision system, VCRs interpret the security codes from the DVD video. This causes the video signal to degrade. The most common symptom is the brightness of the video apparently pulsing bright and dark over the course of viewing. Other visual degradation may also occur.

Since the circuit that triggers the Macrovision security is within the VCR, the solution is to connect the video cable directly to the television.

If the TV has only a Radio-Frequency (RF) or coaxial-cable type connector and does not have a composite video or S-video type connector, then you would need an RF modulator. RF modulators can be found at most electronics stores.

A standalone DVD player will also experience the same symptoms and would require a direct connection to the TV or an RF modulator to avoid the Macrovision protection.

Additional Information

Refer to Knowledge Base article 16536: "**MultiMedia Glossary: A-F (1 of 3)**" for definitions of some of the terms used in this article.

For more information on Macrovision technology refer to their web site at http://www.macrovision.com/.

Mac OS 9: Cannot Initialize Zip Disk Using DOS Format

After updating to Mac OS 9.1 or later the option to format a Zip disk in DOS format may no longer appears in the Format Options menu of the Iomega Tools application.

This article has been archived and is no longer updated by Apple.

Symptom

The option to format a Zip disk in DOS format no longer appears in the Format Options menu of the Iomega Tools application.

Solution

Upgrade to IomegaWare 3.0.4 or later and use the Iomega Tools application to format Zip disks as DOS. IomegaWare 3 is available for Mac OS 9 from the Iomega Web site (http://www.iomega.com/software/ioware3mac.html).

Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iMac (Early 2001): Technical Specifications

This article provides the technical specifications for the iMac (Early 2001) computer introduced February, 2001.

This article has been archived and is no longer updated by Apple.

Processor and memory

- 400 MHz, 500 MHz or 600 MHz PowerPC G3 processor
- 512K backside level 2 cache at 160 MHz (400 MHz system); or 256K on-chip level 2 cache at full processor speed (500 MHz and 600 MHz systems) (See Note 5.)
- 100 MHz system bus
- 64 MB or 128 MB of PC100 or PC 133 SDRAM; two DIMM slots support up to 1 GB using 64 MB, 128 MB, 256 MB, or 512 MB DIMMs

Keyboard and mouse

- Apple Pro Keyboard with full-size function and navigation keys, audio controls, and media-eject key
- Apple Pro Mouse with optical sensor for precision cursor control

Display

- Built-in 38 cm shadow-mask CRT (35 cm diagonal viewable image size); 0.28 mm dot pitch
- Onscreen geometry adjustment to keep display images properly aligned throughout its lifetime
- Theater Mode for enhanced brightness of full-screen video
- Flip foot for 17° tilt

Graphics support

- ATI RAGE 128 Pro graphics accelerator with 8 MB of SDRAM or ATI RAGE 128 Ultra graphics accelerator with 16 MB of SDRAM; AGP 2X support
- Screen resolutions: 640 by 480 pixels at 117 Hz, 800 by 600 pixels at 95 Hz, and 1024 by 768 pixels at 75 Hz
- 24-bit true color at all resolutions for displaying millions of colors

Video

- Standard VGA output port (15-pin mini D-Sub connector)
- Support for video mirroring: external devices display an image identical to that shown on the built-in display

Communications

- Built-in 56K V.90 modem (RJ-11 connector)(See Note 2.)
- 10/100BASE-T Ethernet (RJ-45 connector)
- Optional 11Mbps AirPort Card; IEEE 802.11 DSSS compliant (See Note 3.)
- Optional AirPort Base Station with 56K modem and 10BASE-T Ethernet port (See Note 3.)

Peripheral connections

- Two USB ports on computer (12 Mbps each; one used for keyboard); two USB ports on keyboard (12 Mbps each; one used for mouse)
- Two 400 Mbps FireWire (IEEE 1394) ports (See Note 4) ; includes 4-pin-to-6-pin FireWire cable for connecting DV camera

Audio

- Integrated high-performance Odyssey audio system by Apple and Harman Kardon
- Built-in microphone for speech recognition and audio recording
- Front-mounted dual mini headphone jacks (headphones not included)
- Analog audio input and output minijacks; up to 16-bit stereo and 44.1kHz sampling rate
- Support for external USB audio devices
- **Storage**
- 10 GB, 20 GB, or 40 GB Ultra ATA hard disk drive (See Note 1.)

- Slot-loading 24x (maximum) CD-ROM drive (reads CD at 24x speed); or 8x4x24x (maximum) CD-RW drive (writes CD-R at 8x speed, writes CD-RW at 4x speed, reads CD at 24x speed)
- Support for external FireWire and USB storage devices

Electrical requirements and agency approvals

- Line voltage: 100 V to 260 V AC
- Frequency: 47 Hz to 63 Hz, single phase
- Maximum continuous power: 150 W
- U.S. EPA ENERGY STAR compliant

Environmental requirements

- Operating temperature: 10 °C to 35 °C
- Storage temperature: -47 °C to 47 °C
- Relative humidity: 5 to 95 percent noncondensing
- Altitude: 0 m to 3000 m

Size and mass (weight)

- Height: 381 mm
- Width: 381 mm
- Depth: 435 mm
- Mass: 15.8 kg

Notes:

1. For hard drive capacity measurements, 1 GB = 1 billion bytes; actual formatted capacity less.

2. Actual modem speeds lower; speed depends on connection rate and other factors.

3. Wireless Internet access requires AirPort Card, AirPort Base Station, and Internet access (fees may apply). Some ISPs are not currently compatible with AirPort, including America Online. Range may vary with site conditions.

4. Actual rates will vary.

5. 500 Mhz models outside North America have 512K backside level 2 cache at 200 Mhz.

Note: Wireless internet access requires an internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590. "**AirPort: Requirements for Wireless Internet Access".**

Power Mac G4 Cube: Troubleshooting: Mouse: Pointer Does Not Move With the Mouse

This article explains how to troubleshoot a Power Mac G4 Cube computer when the pointer does not move with the Apple Pro Mouse when the computer is turned on.
This article has been archived and is no longer updated by Apple.

Symptom

At system startup time, the pointer does not move with the Apple Pro Mouse.

Solution

1. Disconnect and reconnect the mouse securely to the keyboard.
2. If the mouse is connected to keyboard, connect the mouse to one of the USB ports on the computer instead. If the mouse works, replace the keyboard.
3. Start up from the Software Restore disc or use the Extensions Manager control panel to start up the computer with the Mac OS All 9.x extensions set. If OK, troubleshoot extensions. If the pointer doesn't move, replace the mouse.
4. Disconnect all third-party USB devices. If the symptom is resolved, the mouse is OK and the issue is with one of the third-party USB devices. Reconnect each USB device until the issue reappears. Refer to the third-party USB company for compatibility information.
5. One or both USB ports may be causing the symptom. Contact Apple to schedule a service repair.

Published Date: Oct 7, 2016

Macintosh Manager: Client Login Troubleshooting

This article discusses how to troubleshoot Macintosh Manager/Multiple Users client computers that are having difficulty logging in. This article assumes that the client computer displays the log in screen.
This article has been archived and is no longer updated by Apple.
1. Be sure that all of your software is up to date. Please refer to article 58821: "**Macintosh Manager: Recommended Software Versions**".

2. Extensions isolation.

a) Mac OS 9 clients: Set the Extensions Manager to "Mac OS 9.x All", restart to test the issue (this set includes the necessary Macintosh Manager/Multiple Users software.)
b) Mac OS 7.6.1/8.x clients: Set the Extensions Manager to "Mac OS All" and then duplicate the set. Enable the Macintosh Manager 1.3 package and restart to test again (for more information on extensions packages, refer to article 30929: "**Mac OS: Extension Conflict Troubleshooting/Extensions Manager Features"**).

Note: Customers using Mac OS 8.1 on client computers should refer to article 25080: "**Macintosh Manager: Unable to Start the Requested Environment Message**".

3. Determine if the issue is Client or Server specific.

a) If all Macintosh Manager clients are affected, it is likely to be a Server specific issue. Create a new test user and test workgroup and retest the issue. If you are still unable to log in, then follow the Network Troubleshooting steps in step 5.
b) If specific clients are affected, it is likely to be a Client specific issue addressed in step 4.

4. Drag relevant preferences to the Trash. Use the list below to determine which apply to your configuration:

Macintosh Manager clients

Drag the following items to the Trash:
ClientStartupDisk: System Folder: Preferences: Multiple-Users:
ClientStartupDisk: System Folder: Preferences: Macintosh Manager Prefs
ClientStartupDisk: System Folder: Preferences: Client Prefs

Multiple Users clients

Drag the following items to the Trash:

- ClientStartupDisk: System Folder: Preferences: Multi-User Items:
- ClientStartupDisk: System Folder: Preferences: Multi-User Prefs

Note: Macintosh Manager clients mean they bind to a Macintosh Management Server. Multiple Users clients mean they do not bind to a Macintosh Management Server but rather use local databases. When deleting local preferences (only for Multiple Users clients), some reconfiguring of the Multiple Users control panel is needed to continue testing the issue.

If deleting the preferences listed above did not resolve the issue, then drag the following items from the client's Preferences folder inside the System Folder to the Trash:

- AppleTalk Preferences
- TCP/IP Preferences
- AppleShare Prep

5. Check Network connections.

a) Verify network connectivity from System Access. Check AppleTalk and TCP/IP connectivity while in System Access. If you do not have network connectivity issues and this is a Client-specific issue, skip to step 6. If you do not have network connectivity issues and this is a Server-specific issue, then follow the steps in article 88023: "**Macintosh Manager: Recovering an Unusable Database**". If you do have network connectivity issues, proceed to step 5b.
b) Verify your Network settings, making sure you have proper subnet masks and the router/gateway address is in your subnet. Take note if your clients use DHCP or have static IP addresses. Also note your interface setting (AirPort or Ethernet or Ethernet slot x).
c) Be sure Spanning Tree Protocol is disabled as described in article 30922: "**Spanning Tree Protocol: AppleTalk Issues**".
d) Be sure to use Category 5 (Cat 5) Ethernet cable for proper 100-BaseT connections. Try swapping out with known good Ethernet cables. Also, try using another node (port) on your hub or switch.

6. If issue persists, additional software troubleshooting is required as follows:

a) Remove and reinstall Macintosh Manager on the affected client computers.
b) Remove and reinstall the AppleShare client software on the affected client computers.
c) Remove and reinstall Open Transport on the affected client computers.

7. If this is a client specific issue and none of the above steps have resolved it, perform a clean installation on the affected computers.

Published Date: Feb 20, 2012

Macintosh Manager: Recommended Software Versions

This document outlines the versions of Macintosh Manager and other related Apple software that should be used for Macintosh Management/Multiple Users environments.

This article has been archived and is no longer updated by Apple.

Macintosh Manager 1.0 to 1.4.1

The following table documents all the relevant software and versions:

Mac OS Version	Component Software Version	Download and Update
Mac OS 7.6.1	Macintosh Manager 1.4.1	Yes
	AppleShare Client 3.8.3	Yes
	Open Transport 1.1.2	Yes
	LaserWriter 8.6	Yes
Mac OS 8.1	Macintosh Manager 1.4.1	Yes
	AppleShare Client 3.8.6	Yes
	Open Transport 1.3.1	Yes
	LaserWriter 8.6	Yes
Mac OS 8.5.x	(update to Mac OS 8.6)	
Mac OS 8.6	Macintosh Manager 1.4.1	Yes
	AppleShare Client 3.8.8	Yes
	Open Transport 2.0.3 or 2.6	See technical document 58805: "**Open Transport 2.6 Document and Software**"
	LaserWriter 8.6.5	Ships with Mac OS 8.6
Mac OS 9.0.x	Update to OS 9.0.4	
Mac OS 9.0.4	Macintosh Manager 1.4.1	Yes
	AppleShare Client 3.8.8	Yes
	Open Transport 2.6	Yes
	LaserWriter 8.7	Included with Mac OS 9.0.4
Mac OS 9.1	Multi-User Startup 1.4.1	Yes
	AppleShare Client 3.8.8	Included with Mac OS 9.1
	Open Transport 2.7.4	Included with Mac OS 9.1
	LaserWriter 8.7	Included with Mac OS 9.1
Mac OS 9.2	Update to Mac OS 9.2.2	
Mac OS 9.2.2	Macintosh Manager 1.4.1	Included with Mac OS 9.2.2 but not automatically installed when using Software Update
	AppleShare Client 3.9.2	Included with Mac OS 9.2.2

	Open Transport 2.7.9	Included with Mac OS 9.2.2
	LaserWriter 8.7.1	Included with Mac OS 9.2 or later

Note: AppleShare Clients 3.8.6 and 3.8.8 require Keychain, which is part of Mac OS 9, to save name and password for automatically connecting to server volumes at startup. Mac OS 8.1 through 8.6 users who rely on this feature can use AppleShare Client 3.8.3 instead.

Macintosh Manager 2.0 and later

The following table documents all the relevant software versions for Macintosh Manager 2 clients.

Note: Clients should not be updated before the server is updated to Mac OS X Server 10.0.3 or later, which includes Macintosh Management Server 2.0 or later. Unless you have a specific reason not to update, you should use the latest versions of software listed for which your computers meet system requirements., currently Mac OS X Server 10.1.1 and Macintosh Manager 2.1.

Mac OS Version	**Component Software Version**	**Download and Update**
Mac OS 8.1	Macintosh Manager 2.1.1	Yes
	AppleShare Client 3.8.7 or 3.8.8	Macintosh Manager 2.1.1 installs 3.8.7 on computers with 68000-family microprocessors and 3.8.8 on computers with PowerPC microprocessors.
	Open Transport 1.3.1	Yes
	LaserWriter 8.6	Yes
Mac OS 8.5 to 8.5.1	Update to Mac OS 8.6	
Mac OS 8.6	Macintosh Manager 2.1.1	Yes
	AppleShare Client 3.8.8	Yes
	Open Transport 2.0.3 or 2.6	See technical document 58805: "**Open Transport 2.6 Document and Software**"
	LaserWriter 8.6.5	Included with Mac OS 8.6
Mac OS 9 to 9.0.3	Update to Mac OS 9.0.4 or later	
Mac OS 9.0.4	Macintosh Manager 2.1.1	Yes
	AppleShare Client 3.8.8	Yes
	Open Transport 2.6	Yes
	LaserWriter 8.7	Inluded with Mac OS 9.0.4
Mac OS 9.1	Macintosh Manager 2.1.1	Yes
	AppleShare Client 3.8.8	Included with Mac OS 9.1
	Open Transport 2.7.6	Yes
	LaserWriter 8.7	Included with Mac OS 9.1
Mac OS 9.2	Update to Mac OS 9.2.2	

Mac OS 9.2.2	Macintosh Manager 2.1.1	Yes
	AppleShare Client 3.9.2	Included with Mac OS 9.2 or later
	Open Transport 2.7.9	Included with Mac OS 9.2 or later
	LaserWriter 8.7.1	Included with Mac OS 9.2 or later

DVD Studio Pro 1.1: QuickTime Pro Registration

Learn how to register QuickTime Pro using the information included with DVD Studio Pro 1.1.

This article has been archived and is no longer updated by Apple.

The DVD Studio Pro 1.1 package contains an inbox notice titled "Read This Before Installing DVD Studio Pro." This notice describes how to register QuickTime Pro. A software serial number sticker is attached to the upper right corner of the notice. The sticker has two identical QuickTime Pro serial number labels. Apple suggests placing one label on the inside front cover of the product manual and the second in another safe place.

Unlocking QuickTime Pro

After you've installed QuickTime Pro on your computer, use the registration name and registration number on the label to unlock the extended multimedia capabilities of QuickTime Pro.

To unlock QuickTime Pro , follow these steps:

1. Open the QuickTime Settings control panel.
2. Choose Registration from the pop-up menu.
3. Click Enter Registration.
4. Enter the registration information exactly as it appears on the software serial number label. The content of the "Registered to" field is specific to the version of QuickTime being installed.
    - If you are upgrading QuickTime 4, in the "Registered to" field type "QuickTime 4 Pro".
    - If you are upgrading QuickTime 5, in the "Registered to" field type "QT5 for DVD Studio Pro 1.1".
    - If you are upgrading QuickTime 6, in the "Registered to" field type "QT6 for DVD Studio Pro 1.1".
    - In the "Registration Number" field, type the registration number listed on the software serial number label.

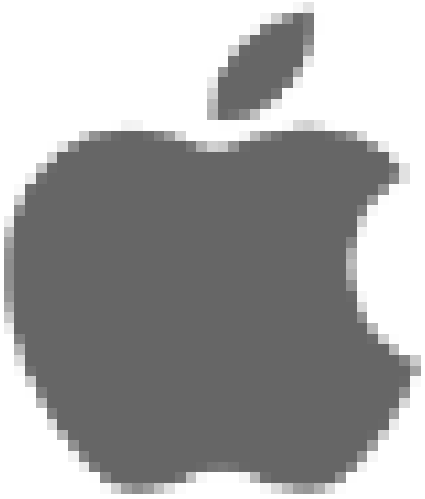

Figure 1 QuickTime control panel registration

5. Click OK.

6. Close the QuickTime Settings control panel.

If a message says the registration information is not valid, follow steps four through five again. When you enter the registration number, make sure you type a 0 for the numeral zero.

Note: The QuickTime Pro registration number that comes with DVD Studio Pro is also valid for QuickTime 5 or QuickTime 6 depending on which version of QuickTime was included with the DVD Studio Pro CD you received.

TA26084_DVD_Studio_Pro_QuickTime_Pro_Registration.pdf

For the latest information on updates and new versions, visit the DVD Studio Pro Web site.

Mac OS X 10.0: Cameras and Devices That Work With Image Capture

Image Capture is Apple's image acquisition framework and application for Mac OS X. This article discusses what kinds of devices Image Capture will work with and how to determine if your camera or card reader is compatible.

This article has been archived and is no longer updated by Apple.

Note: This article applies to Mac OS X 10.0 to 10.0.4. If you have updated to Mac OS X 10.1, please see technical document 106523: "**Mac OS X 10.1: Cameras and Devices Compatible With Image Capture**"

Digital cameras use a variety of protocols for transferring data to your computer. Some are industry standard (such as PTP). Others are proprietary to a particular camera or company. Listed below are the five categories of devices that work with Image Capture (PTP, Digita, Mass Storage, Custom, and Card Readers) and the devices that Apple has successfully tested.

Note: The cameras listed in this article are cameras Apple has successfully tested with Image Capture. Your camera may still be compatible even though it is not listed. Check with the vendor of the camera to find out which transfer protocol it uses, or obtain a card reader compatible with Image Capture.

PTP (Picture Transfer Protocol)

- Kodak DC 4800
- Kodak mc3
- Sony DSC-S75

Note: Image Capture may have difficulty recognizing the Kodak DC 4800 camera if the Classic environment is open.

Digita

- Kodak DC 220, 260, 265, 290
- HP PhotoSmart 618, 912 (works with dual mode: Digita and Mass Storage)

Note: Image Capture may have difficulty recognizing Digita cameras if the Classic environment is open.

Mass Storage

- HP PhotoSmart 618, 912 (works with dual mode: Digita and Mass Storage)
- Panasonic SuperDisk
- Toshiba PDR-M4, M5, M70
- Fuji FinePix 1400, 2400, 40i
- HP PhotoSmart 315

Custom

Some camera makers may have made a custom plug-in for Image Capture. Contact the camera vendor to see if Image Capture plug-in module is available.

Card Readers

- SanDisk (USB)
- Sony Memory Stick Reader (USB)

Note: This article provides information about non-Apple products. Apple, Inc. is not responsible for its content and mention of this product should

not be interpreted as a recommendation by Apple. Please contact the vendors for additional information.

Mac OS 9: Enabling/Disabling CD AutoPlay

This article explains how to enable or disable Audio CD AutoPlay when the CDStrip Control Strip Module is not installed. When AutoPlay is enabled, audio CDs begin playing as soon as they are inserted into the CD or DVD drive.
This article has been archived and is no longer updated by Apple.
CD AutoPlay can be enabled or disabled by using the CD portion of the Control Strip. However, computers that come with iTunes installed on the hard disk no longer use the CDStrip Control Strip module (CSM). The iTunes Strip CSM has replaced the CDStrip module but it does not allow you to disable Audio CD AutoPlay.

To enable or disable Audio CD AutoPlay follow these steps:

1. Open the QuickTime Settings control panel.
2. Choose AutoPlay from the pop-up menu.
3. Select or deselect the "Enable Audio CD AutoPlay" option.

Published Date: Feb 20, 2012

Apple ADC Displays: Will Not Turn Off Independent of Computer

Pressing the power button on an Apple display with Apple Display Connector (ADC), will put the computer and display to sleep. It is not possible to turn off the display and leave the computer on.

This article has been archived and is no longer updated by Apple.

Symptom

If the option "Pressing power button puts computer to sleep" is enabled in the Energy Saver control panel, touching the display's touch switch will put the computer and monitor to sleep.

If the option "Pressing power button puts computer to sleep" is not enabled in the Energy Saver control panel, touching the display's touch switch will not put the computer and monitor to sleep.

Solution

It is not possible to turn off the display and leave the computer on. If you wish to reduce the energy use of the display, use the Energy Saver control panel to adjust the time before the display goes to sleep.

To allow the display to sleep separately from the computer, follow these steps:

1. Open the Energy Saver control panel.
2. Click Sleep Setup.
3. Click the checkbox to turn on "Separate timing for display sleep."
4. Drag the slider to select the time for display sleep.
5. Close the Energy Saver control panel.

For more information on the Touch Switch, please see article 58671: "**Apple Studio Display LCD (ADC): Information on Touch Switch**"

iMac (Early 2001): How to Identify an iMac With Elo iTouch Touchscreen

This article explains how to tell if an Elo iTouch touchscreen is installed on an iMac computer.

This article has been archived and is no longer updated by Apple.

You can tell if an Elo iTouch touchscreen is installed on an iMac computer by looking in two places:

1. The internal Elo board plugs into one of the computer's USB ports.
2. The computer has an Elo sticker on its bottom, as shown in Figure 1.

Figure 1 Elo product ID label

Important: Elo iTouch touchscreens use special transducers connected to the iMac CRT. As a result, any service that requires removal of the inner CRT bezel should be performed only by Elo Touchsystems.

You may contact Elo Technical Support at:
Toll-free: 800-557-1458, ext 4607 in Canada and the United States.

iMac (Summer 2001): Technical Specifications

This article provides information on the iMac (Summer 2001) introduced in July, 2001.

This article has been archived and is no longer updated by Apple.

Technical Specifications

Processor and memory

500MHz, 600MHz or 700MHz PowerPC G3 processor with 256K on-chip level 2 cache

100MHz system bus

128MB or 256MB of PC100 SDRAM; two DIMM slots support up to 1GB using 128MB, 256MB, or 512MB DIMMs

Keyboard and mouse

Apple Pro Keyboard with full-size function and navigation keys, audio controls, and CD-eject key

Apple Pro Mouse with optical sensor for precise cursor control

Display

Built-in 15-inch shadow-mask CRT (13.8-inch diagonal viewable image size); 0.28-mm dot pitch

Onscreen geometry adjustment to keep display images properly aligned throughout its lifetime

Theater Mode for enhanced brightness of full-screen video using iMovie or QuickTime Player

Flip foot for 17° tilt

Graphics support

ATI RAGE 128 Ultra graphics accelerator with 16MB of SDRAM graphics memory; AGP 2X support

Three crisp, flicker-free screen resolutions: 640 by 480 pixels at 117 Hz, 800 by 600 pixels at 95 Hz, and 1024 by 768 pixels at 75 Hz

24-bit true color at all resolutions for displaying millions of colors

Video

Standard VGA output port (15-pin mini D-Sub connector)

Support for video mirroring: external devices display an image identical to that shown on the built-in display

Communications

Built-in 56K V.90 fax/modem (RJ-11 connector)(2)

10/100BASE-T Ethernet (RJ-45 connector)

Support for optional 11Mbps AirPort Card; IEEE 802.11 DSSS compliant (3)

Support for optional AirPort Base Station with 56K fax modem and 10BASE-T Ethernet port (3)

Peripheral connections

Two USB ports (12 Mbps each) on computer; two USB ports on keyboard

Two 400Mbps FireWire (IEEE 1394a) ports(4); includes 4-pin-to-6-pin FireWire cable for connecting DV camera

Audio

Integrated high-performance Odyssey audio system by Apple and Harman Kardon

Built-in microphone for speech recognition and audio recording

Front-mounted dual mini headphone jacks (headphones not included)

Analog audio input and output minijacks; up to 16-bit stereo and 44.1-kHz sampling rate

Support for external USB audio devices

Storage

20GB, 40GB, or 60GB Ultra ATA hard disk drive (1)

Slot-loading 8x4x24x (maximum) CD-RW drive (writes CD-R discs at 8x speed, writes CD-RW discs at 4x speed, reads CDs at 24x speed)

Support for external FireWire and USB storage devices

Electrical requirements and agency approvals

Line voltage: 100V to 260V AC

Frequency: 47 to 63 Hz, single phase

Maximum continuous power: 150W

Meets ENERGY STAR requirements

Environmental requirements

Operating temperature: 50° to 95° F (10° to 35° C)

Storage temperature: -40° to 116° F (-40° to 47° C)

Relative humidity: 5% to 95% noncondensing

Maximum altitude: 10,000 feet

Size and weight

Height: 15.0 inches (38.1 cm)

Width: 15.0 inches (38.1 cm)

Depth: 17.1 inches (43.5 cm)

Weight: 34.7 pounds (15.8 kg)

Notes:

1) For hard drive capacity measurements, 1GB = 1 billion bytes; actual formatted capacity less.
2) Actual modem speeds lower; speed depends on connection rate and other factors.
3) Wireless internet access requires an internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590. "**AirPort: Requirements for Wireless Internet Access".**
4) Actual rates will vary.

5) The parenthetical product description (Summer 2001) refers to the summer of the Northern Hemisphere.

Power Mac G4 (QuickSilver): Late Breaking News

This article consists of the Late Breaking News document included on the hard drive of the Power Mac G4 (QuickSilver) computer.

Using your Power Mac G4

1. Playing audio CDs
2. Important information about system sleep
3. Using your computer with a NetBoot Server
4. Using Easy Access with virtual memory in Mac OS 9
5. Using older Macintosh USB keyboards
6. Apple DVD Player
7. Recording media on CDs
8. Recording media on DVDs
9. Updating software
10. Installing Mac OS X server software

Third-party software issues

11. Using the internal modem
12. Using Palm HotSync Manager

Hardware compatibility issues

13. Opening the optical drive with third-party keyboards

This article has been archived and is no longer updated by Apple.

About your Power Mac G4

This document contains important late-breaking information about your computer. For additional information, see the other sections of Mac Help or go to the Apple Support Web site on the Internet at www.apple.com/support

Using your Power Mac G4

Playing audio CDs

You can use iTunes, in the Applications folder, to play audio CDs, import songs, create playlists, listen to Internet radio, and more. The AppleCD Audio Player and the CDStrip Control Strip module for Mac OS 9 are in the CD Extras Folder on the Software Install CD.

Important information about system sleep

Certain system settings may prevent your computer from going to sleep. You may notice that the screen dims and the sleep indicator light pulses, but the internal fan still runs.

Many communications programs, such as PPP, Apple Remote Access, and other dialup programs, monitor the computer's modem port to check for incoming transmissions when set to auto-answer incoming calls. This may prevent the computer from going into sleep completely.

If the Configure pop-up menu in the TCP/IP control panel (Mac OS 9) is set to Using DHCP Server, your computer may not sleep when your Web browser or email application is open or a file server is mounted on your desktop. Quit these applications and unmount file servers when they are not being used.

The Palm Desktop HotSync function may prevent your computer from going to sleep. To turn off the HotSync function, open Palm Desktop and choose Setup from the HotSync menu. Then click the Disabled button and verify that the "Enable HotSync software at system startup" checkbox is not selected. Turn HotSync back on when you want to synchronize with your Palm-compatible device.

If you use fax software, such as FAXstf, and the software is set to auto-answer, your computer may not sleep completely. The screen will dim (instead of turn off). To allow your computer to sleep, disable auto-answering. To disable auto-answering in FAXstf, open FaxBrowser and choose Settings from the Edit menu. Then choose the FaxModem icon and choose Never from the Answer On pop-up menu.

Note: If you connect a USB device while the computer is in sleep, your computer wakes.

Using your computer with a NetBoot Server

If you want to use your computer as a NetBoot client, you may need to update the system software on the NetBoot Server. Check the Mac OS X Server Web site at www.info.apple.com/support/macosxserver

Using Easy Access with virtual memory in Mac OS 9

The Easy Access control panel doesn't work with virtual memory turned on. Before using the Easy Access feature, open the Memory control panel and turn virtual memory off.

Using older Macintosh USB keyboards

You can use the Power button on older Apple USB keyboards to turn on your computer when it is connected to a USB port on your computer. You cannot use it to turn on your computer when the keyboard is connected to a USB hub or to a USB port on your monitor. You can also turn on the computer using the Power button on the computer. If you have an Apple Display with an ADC connector, you can also use the power button on the front of the display.

Apple DVD Player

If your computer has an optical drive with DVD playback capabilities and Multiple Users is enabled (through the Multiple Users control panel in Mac OS 9), Apple DVD Player will open automatically when you start up your computer in Mac OS 9. To prevent this, open the Extensions Manager control panel and turn off the DVD AutoLauncher extension. To play a DVD video, open the Apple DVD Player (in the Apple menu).

For information on optimal system settings for DVD playback, see the Apple DVD Player Read Me file located in the Apple DVD Player folder inside the Applications (Mac OS 9) folder on your hard disk.

Recording media on CDs

Use CD-R and CD-RW media with a 74-minute media capacity. You cannot record on "High-Speed" (greater than 4X) CD-RW media, although your drive can read these discs. You can record on high-speed CD-R discs. When handling discs, be careful not to leave fingerprints, place other materials on the discs, or add labels to the discs that may cause them to become unbalanced when spinning.

Use CD-R discs for recording audio CDs, because most audio CD players cannot read CD-RW discs. See technical document 58785 "**Macintosh: "Problem With Target Device. Error Code -7932" Alert**".

Recording media on DVDs

Use DVD-R General media with a 4.7 GB media capacity. Your drive doesn't support DVD-R Authoring media. Some DVD-R/CD-RW drives cannot read DVD-RAM discs and will eject them. When handling discs, be careful not to leave fingerprints, place other materials on the discs, or add labels to the discs that may cause them to become unbalanced when spinning.

Updating software

Use Software Update to ensure that you have the latest software versions, drivers, bug fixes, and other updates. In Mac OS X, open System Preferences and click Software Update. In Mac OS 9, choose Control Panels from the Apple menu, then choose Software Update from the submenu and click Update Now. You can also see the Apple Support Web site on the Internet for the latest troubleshooting information and software updates: www.apple.com/support

Installing Mac OS X server software

If you are installing Mac OS X server software on your computer, you need to install the Power Mac G4 Support application from the Mac OS X Install CD that came with your computer. For details, see the Read Before You Install document in the Mac OS X Server Support folder (in the Welcome to Mac OS X folder) on the Mac OS X Install CD.

Third-party software issues

Using the internal modem

Some communications software, such as FAXstf and Total Access, provide different modem selection preferences from those in the Modem control panel. To ensure the fastest possible connection speed, select Apple Internal 56K Modem (V.90) in the Modem control panel.

Using Palm HotSync Manager

If you attempt to make a connection and a sync fails or doesn't complete, set the connection speed to a lower setting. To do this, open HotSync Manager. Click the Serial Port Settings tab. In the Local Setup section, select 19200 as the speed.

Hardware compatibility issues

Opening the optical drive with third-party keyboards

If you use a keyboard that doesn't have a Media Eject key, you can assign a key to open and close the optical drive. Follow the instructions in your manual to start up your computer in Mac OS 9. Then follow the instructions in the Read Me in the Eject Extras folder located in the Apple Extras folder (in the Applications folder).

Published Date: Oct 7, 2016

Power Mac G4: How to Turn the Computer On and Off

The Apple Pro Keyboard does not have a Power button to turn on a computer. This article explains how to turn a Power Mac G4 computer on and off.
This article has been archived and is no longer updated by Apple.
There are two ways to turn the Power Mac G4 computer on and off:

- Press the power button on the computer
- Press the power button on one of these displays:
  - Apple Studio Display 17 (LCD)
  - Apple Cinema Display (ADC)
  - Apple Studio Display LCD (ADC)
  - Apple Studio Display 17 (ADC)
  - Apple Cinema HD Display

The power button on the Power Mac G4 Cube computer and the displays listed above can sense when you touch them with your finger. Refer to Figures 1 and 2 for the location of these buttons.

Touch the power button with the flat part of your finger and hold it there briefly. The switch gently flashes when you touch it.

Figure 1 Display power button

Figure 2 Power Mac G4 Cube power button

Note: The power button on other Power Mac G4 computers is mechanical and you must press to activate them.

To turn off the computer without choosing Shut Down, press the power button until the shut down dialog box appears on screen, then click Shut Down.

Published Date: Oct 7, 2016

Apple Displays: Touch Switches Don‘t Work Properly

This document lists troubleshooting steps you can try when the touch switches on an Apple display with an Apple Display Connector (ADC) don't work properly.

This article has been archived and is no longer updated by Apple.

Symptom

An Apple display with an Apple Display Connector (ADC) exhibits one or more of the following symptoms:

- Unable to turn on the display using the display's touch switch
- Display turns on then off
- Unable to open the System Preferences pane using the Launch touch switch
- USB devices don't work when plugged into the display's USB ports

Solution

1. Make sure the display cable is securely connected to the computer's video card. Turn on the computer to see if the symptom is gone. If not, continue with step 2.

2. Disconnect the display cable from the computer's video card.

3. Examine the Apple Display Connector on the display cable. Look for and carefully straighten any bent pins. Do not plug the display cable into the video card yet.

Figure 1 Apple Display Connector on display cable

4. Examine the Apple Display Connector on the video card. Look for any bent pins. Do not try to straighten them. Look for damage to the plastic housing surrounding the video pins.

Figure 2 Example of bent pins on a video card's Apple Display Connector

5. If you do not see any damage to the Apple Display Connector on the video card, reconnect the display cable. Turn on the computer to see if the symptom is gone.

6. If the symptom persists, or if the video card has bent pins, or its plastic housing is damaged, contact Apple or an Apple Authorized Service Provider for further assistance.

Note: Touch switches on some Apple displays can be disabled through the software. If the touch switches light up when touched but no action takes place, review technical document 58813, "**LCD Displays: How to Disable Touch Switch**" to determine whether the touch switches have been disabled.

Warning: If bent pins are found on either connector, the affected product **should not be used** until it has been repaired. Failure to do so will cause damage to any connector plugged into it.

Published Date: Feb 20, 2012

Power Mac G4 (QuickSilver): Apple Optical Drives and BURN-Proof Technology

This document describes the use of BURN-proof (Buffer Under Run Error Proof) technology in the optical drives of Power Mac G4 (QuickSilver) and Power Mac G4 (QuickSilver 2002)computers.
This article has been archived and is no longer updated by Apple.
The optical drives in the Power Mac G4 (QuickSilver) and Power Mac G4 (QuickSilver2002) computers do not use BURN-proof technology. Apple does not believe that there is a significant issue with buffer underrun in any Apple drives. BURN-proof is a technology developed by Sanyo that allows compact disc recording to automatically stop in the event of an unplanned interruption, and then to resume recording. BURN-Proof is a registered trademark of Sanyo.

Apple's systems are designed to virtually eliminate buffer underrun during the creation of CD-R and CD-RW discs. Buffer underrun occurs when the source volume cannot keep up with the target drive. In Apple computers, the source is always a hard drive and the target is a CD-RW, Combo, or Superdrive. Hard drives used in Apple computers have read rates that are always faster than optical drive writing rates.

Published Date: Oct 7, 2016

Ethernet: 10/100/1000Base-T Ethernet Port Pinouts

This document provides the pinouts for the 10/100 and Gigabit Ethernet ports on Macintosh computers.
This article has been archived and is no longer updated by Apple.
This article is relevant for the following products:

- iMac
- Power Mac G4
- PowerBook G3 Series (Bronze Keyboard)
- PowerBook (FireWire)
- PowerBook G4
- iBook (FireWire)
- iBook (Dual USB)
- Macintosh Server G3
- Power Macintosh G3 (Blue and White)

An Ethernet port uses an RJ-45 connector. It is typically located on the back or side of the computer. Table 1 shows the signals and pin assignments for 10Base-T and 100Base-T. Table 2 shows the signals and pin assignments for 1000Base-T, otherwise known as gigabit Ethernet.

Table 1 Signals for 10Base-T and 100Base-T

Pin	Signal name	Signal definition
1	TXP	Transmit (positive lead)
2	TXN	Transmit (negative lead)
3	RXP	Receive (positive lead)
4	Â	Not used
5	Â	Not used
6	RXN	Receive (negative lead)
7	Â	Not used
8	Â	Not used

Table 2 Signals for 1000Base-T

Pin	Signal name	Signal definition
1	TRD+(0)	Transmit and receive data 0 (positive lead)
2	TRDÂ(0)	Transmit and receive data 0 (negative lead)
3	TRD+(1)	Transmit and receive data 1 (positive lead)
4	TRD+(2)	Transmit and receive data 2 (positive lead)
5	TRDÂ(2)	Transmit and receive data 2 (negative lead)
6	TRDÂ(1)	Transmit and receive data 1 (negative lead)
7	TRD+(3)	Transmit and receive data 3 (positive lead)
8	TRDÂ(3)	Transmit and receive data 3 (negative lead)

Gigabit Ethernet is a standard developed by the Gigabit Ethernet Alliance, and defined by the IEEE 802.3 committee. The aim of this standard is to utilize existing local area network infrastructure to achieve up to 1 gigabit per second (1 Gbps) transfer rates. This is why gigabit Ethernet utilizes Category 5 or better unshielded twisted pair cabling (UTP), and the RJ-45 connector that is used in 10/100 megabits per second (Mbps) networks. To achieve maximum transfer rates from gigabit Ethernet capable hardware, you also need to install gigabit Ethernet compliant switches, hubs, and routers. Otherwise, the computer switches to a 10 Mbps or 100 Mbps transfer rate depending upon the network hardware that is used.

To utilize gigabit Ethernet, you must use an Ethernet cable with all eight wires (four pairs) present. If you use an inexpensive two pairs-wired cable, the maximum connection speed can only be 100 Mbps.

The Ethernet interface conforms to the ISO/IEC 802.3 specification, where applicable, and complies with IEEE specifications 802.3i (10Base-T), 802.3u-1995 (100Base-T), and 802.3ab (1000Base-T).

About Final Cut Pro 1.0

This article contains the Read Me for Final Cut Pro 1.0, as well as other relevant and late-breaking information.
This article has been archived and is no longer updated by Apple.
This document provides information about Final Cut Pro 1.0 that supplements the information found in your User Manual and on-line help. For the latest information on product updates, tips and tricks, third-party software, and qualified third-party devices always go to the Final Cut Pro Web site at: **http://www.apple.com/finalcutpro/**

Installation Notes

Before You Install Any Software

Turn off any security software that you may have installed on your computer.

Turn off any virus-protection software that you may have installed on your computer.

Be sure to read all the recommendations below before beginning work with Final Cut Pro.

Installation Requirements

You must install Final Cut Pro on a startup hard drive containing Mac OS 8.5 or later.

Do not interrupt the installation process, doing so may result in an incomplete installation and will require you to reinstall the application.

Install QuickTime

The Beta version of QuickTime 4.0 included on your CD-ROM has been qualified for use with Final Cut Pro. However, before installing this version of QuickTime, check the Final Cut Pro Web site for the most current version of QuickTime. The website is at the following URL: **http://www.apple.com/finalcutpro/**

IMPORTANT If a new version of QuickTime 4.0 is not yet available, you need to copy the QuickTime Installer Folder (on your Final Cut Pro CD-ROM disc) to your hard disk before following the QuickTime installation instructions in the Final Cut Pro User's Manual. Open the QuickTime Installer from your hard disk to install the software.

See article 59002: **Final Cut Pro 1.0: QuickTime 4.0 Public Beta Compatibility** for the latest information.

Install All QuickTime Components

When installing, make sure to choose QuickTime Authoring as the installation type. If you experience problems or error messages when launching Final Cut Pro, reinstall QuickTime.

Unlock QuickTime Pro

A complimentary registration code has been included that allows you to unlock QuickTime Pro for this and future releases of QuickTime 4.0. See the update entitled "Read This Before Installing Final Cut Pro" in your box for your registration number and instructions.

Update your Firmware if you own a Power Macintosh G3 (Blue and White)

Before installing Final Cut Pro on a Power Macintosh G3 (Blue and White), you may need to update the firmware. Locate the G3 Firmware Update folder on your Final Cut Pro CD-ROM and open the G3 Firmware Updater utility. The utility determines whether updating is necessary and provides the onscreen instructions for updating.

Hardware Compatibility Notes

Check the following notes to learn of ways to solve problems with specific equipment.

Truevision Targa Audio Issues

When using Truevision hardware, if you capture audio from A2, you will get A1 from the deck. To work around this issue, capture A1+A2, then use the target track controls when editing the clip into a sequence to use only CH2.

To hear audio from a Targa card, use the Sound control panel to set the Sound In and Out to Targa. If the Sound control panel is not in the Control Panels folder in your System Folder, locate it in the Apple Extras folder on your hard disk and set Sound In and Out to Targa.

Targa Video Playback Performance

Clips compressed with non-Targa codecs may perform poorly during playback when using the Targa 2000 as the video card.

Targa Display Issues

If your monitor resolution is different each time you restart when using the Targa 2000 as your display card, use the monitor adapter that came with your Targa product and the monitor adapter that came with your monitor to stabilize your resolution setting.

If your Apple Studio Display 15" or 17" has a green tint when connected to a Targa card, turn off Sync on Green in the Targa control panel.

ATI Video Playback Issues

The Rage 128 ATI chipset is in all "blue and white" G3's and can easily play back a movie at any display resolution. However, if you are using an older model G3, movie playback might be choppy if you are using Rage II+, RagePro, LT-G, and LTPro. To avoid this problem, set the display to 1024 x 768 or smaller. Consult the documentation that came with your computer or use the Apple System Profiler to find out which ATI display card was included in your system. Also, download the latest display software from the ATI Web site at: **http://www.atitech.com/**

ATI Video Acceleration

Use the ATI Video Accelerator Update to speed up playback of certain types of QuickTime movies. The update complements, but does not replace, the ATI Video Accelerator. For more information, see the Read Me that accompanies the update. The update is available at the ATI Web site: **http://www.atitech.com/**

DV Playback

It's best to play your DV clips through ATI video display cards. Attempting to play DV clips on a monitor controlled by video cards from other vendors may result in dropped frames or otherwise poor performance.

If you experience poor performance when playing back DV clips, uncheck "Mirror on Desktop During Playback" in the General tab of the Preferences window.

DV Audio Playback

If you hear an echo when using DV, the built-in speaker in your computer may be competing with monitor speakers. Click the Audio button in the Capture tab of the Preferences window and choose Off in the Speaker pop-up menu.

Keyspan Serial Sevice Control Issues

Keyspan USB Serial Adapter users must use Keyspan driver version 1.5.1 or later. For the latest drivers and support, see Keyspan's Web site: **http://www.keyspan.com/**

If you are using a Keyspan USB Serial Adapter for RS-422 or RS-232 device control, you need to make a direct connection between your Macintosh and video device. For stable communications, connect the Keyspan adapter directly to your Macintosh and attach the serial cable between the Keyspan adapter and video device. You will encounter intermittent communication errors if you attach your Keyspan adapter to a USB hub or pass the signal through a device such as a monitor.

No Communication With a DV Device

If you are having trouble communicating with your DV camera, shut down both your computer and camera for a few minutes before proceeding.

Device control is not available when your camcorder is in Camera mode.

Sony Analog to FireWire Converter Box

The Sony DVMC-DA1 does not provide FireWire or any other form of device control. It only converts analog video and audio signals to DV, which can then be transmitted over FireWire. If you are using this box with a video device that supports serial device control such as RS-422, choose the supported device control protocol in the Device Control tab in the Preferences window. If your analog video device does not support device control, turn off device control in the Device Control tab in the Preferences window. Using Apple FireWire device control with the DVMC-DA1 is not recommended.

Limited Display Resolutions

If your resolution settings are limited to 640 x 480 when using the Apple Studio Display 15" or 17", you can gain access to other resolutions by turning off the Data Display Channel (DDC) control using the on-screen display (OSD) feature of your display. Follow these steps:

1. Press the OSD Enter button on the left of the monitor. The Basic Adjustments menu appears.

2. Choose the ETC icon and press the Enter button.

3. Choose Off to turn off DDC.

4. Press the OSD Exit button.

Causes of Unusual or Inconsistent Behavior

FWB Hardware and Software

Using FWB driver software or FWB SCSI cards, including the HammerTime extensions, with DV or Truevision capture cards is not recommended.

Energy Saving Utilities

Before capturing, turn off the energy saver, screen saver, and sleep features of your computer. These energy saving features may interrupt the capture.

Apple SoftRaid Software

If you experience problems when capturing to an Apple SoftRaid formatted volume using a Truevision capture card, get the most current version of Apple SoftRaid software from the Final Cut Pro Web site: **http://www.apple.com/finalcutpro/**

Deleting Presets

Deleting a preset cannot be undone. Final Cut Pro requires at least one preset to open. If you delete the last preset, you will need to reinstall Final Cut Pro.

Splitting Windows Across Multiple Screens

Splitting a window across multiple screens while working in Final Cut Pro is not recommended.

Operating With Different Drive Formats

Make sure you do not have both Remus and Atto extensions in your System Folder at the same time.

Avoid using drives striped with more than one type of drive formatting software.

Performance Notes

Audio/Video Synchronization in Final Cut Pro

Hardware variations occasionally lead to synchronization problems between audio and video. If you experience A/V sync drifts on long clips, check the box labeled AutoSyncCompensator in the General tab of the Preferences window. The AutoSyncCompensator analyzes clips and compensates for any audio drift by adjusting the sampling rate of audio to match the duration of video in a clip. This adjustment is only applied to the timing of clips in the Browser or Timeline and does not affect the media on disk.

You can specify a minimum duration limit to trigger the AutoSyncCompensator. The AutoSyncCompensator will only analyze clips longer than this duration. The default duration of 5 minutes is suitable for most circumstances.

{Editor's Note: The term AutoSyncCompensator is a single word, not AutoSync Compensator.}

Required DV Capture Frame Rate

DV must always be captured at 29.97 frames per second.

Recommended DV Audio Sample Rates

When creating a DV project, it's best to capture the material at the same audio sample rate it was recorded in. For best results, always shoot, capture, and output at 48 kHz.

Capturing From DV Media

When working with DV, it's best to capture from the original media. If you experience difficulties capturing from mini DV tapes that have been duplicated from DVCAM originals, try capturing from the original DVCAM media.

Disable Disk Monitoring Utilities

For best performance, do not use disk monitoring software such as Symantec's DiskLight while using Final Cut Pro.

Open Video Clips in One Application Only

Do not open a video clip in multiple applications at the same time. A DV file playing in Final Cut Pro while simultaneously open in Movie Player will not play back properly.

Restoring Video Playthrough in the Log and Capture Window

Occasionally you may need to move the Log and Capture window to restore video playthrough. This occurs most often when using Truevision cards with consumer VCRs that do not put out a constant sync signal. Have your input source on and ready before opening Log and Capture.

Eliminating Bad Cuts in Recaptured Clips

When recapturing a sequence with Targa Video when imported from an EDL, you must use handles in the batch capture process. Similarly if you use the sequence trimmer, you need to trim with at least 1 second handles on either side of the clip.

Label Drives With Unique Names

Drives with similar names may cause problems with the capture process. Each drive should have a unique name or at least a unique suffix identifier, for example, Media_1 and Media_2. Using "Media" and "Media_1" will not work.

Reclaiming Storage Space

To manage disk space, make sure to look in the Render Files folder and throw away project folders and render files that are no longer in use.

Capturing Live Video

Video captured live from a camcorder on Standby in Camera mode will not have a timecode. To capture video live from a camcorder with timecode, insert a tape into your camcorder, set your camcorder to Camera mode, then press the Record button.

Mac OS X Server: About Mac OS X Server 1.0-2 Update

This article comprises the Read Me for Mac OS X Server Update version 1.0-2. This software was released by Apple on 21 July 1999 and is available for downloading from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Description
This update addresses a number of issues, and updates server components.

Requires
Mac OS X Server running on any Power Macintosh computer or Macintosh Server with a G3 microprocessor.

This article has been archived and is no longer updated by Apple.

About the Mac OS X Server 1.0-2 Update

This document contains important information about the Mac OS X Server 1.0-2 Update. This update includes a number of improvements and enhancements to Mac OS X Server software.

The update also includes enhancements provided with Mac OS X Server 1.0-1 Update, including support for the official release of the QuickTime Streaming Server, version 1.0 and later improved NetBoot performance

What's new in this update

- The update includes Apache Web server version 1.3.6, which addresses problems that could cause the Apache parent process to terminate unexpectedly.
- The update corrects a problem in which executing a large number of simultaneous CGI scripts could cause the system to become unresponsive if the Apache benchmarking module was enabled.
- Changes to the kernel improve its stability and correct problems that could occur when the server was heavily loaded.
- The version of the kernel now appears as version 5.5 when you are using the uname system utility with the -r or -v options.
- Changes to Network Filesystem (NFS) improve its operation and stability.
- You no longer need to configure TCP/IP to use only AppleTalk.
- If you have a newer ("blue and white") Power Macintosh G3, changes to your monitor resolution are now saved.
- You can now use the dual-channel, ultra-wide SCSI cards available from Apple with some Macintosh Server G3 computers.
- The Workspace Manager now saves the viewer options you select in the Preferences dialog box and the type of view (Icons, Columns, or List) you choose from the View menu for a specific window.
- When you hide the active application, the Workspace Manager now becomes the active application.
- You can now update the MacOS.app to Mac OS 8.6. Because the original image file (StartupDisk.img) is not large enough for the new version of Mac OS, you need to create a new one. To increase the size of the file, see "Enlarging Your Startup Disk Image File" in the "MacOS.html" file, located in the following directory on your Mac OS X Server: `/System/Documentation/ReadMe/Programs&Applications/` To install a new version of the Mac OS in MacOS.app, open MacOS.app and follow the same procedure you use to install the software on any Macintosh computer.
- You can now format disk image files on UFS volumes from MacOS.app; for example, when creating a new StartupDisk.img file using createimage.
- Apple file services works with encrypted passwords sent by AppleShare Client software version 3.8.3. (Be sure to update client computers using the AppleShare Client Installer. Although Mac OS 8.6 includes AppleShare Client software version 3.8.3, it does not include the DHX UAM extension, which is required for encrypted passwords.)

Apple File Services

This section contains important information about changes to Apple file services and Remote Server Administration for Mac OS X Server 1.0-2 Update.

Browser compatibility issues for Remote Server Administration

To use Microsoft Internet Explorer to access Remote Server Administration from a Macintosh computer, you need to select Mac OS Runtime for Java as the Java virtual machine. To do so, open the Edit menu in Internet Explorer and choose Preferences, then open the Web Browser category and select Java. Open the "Java virtual machine" pop-up menu and choose Apple MRJ.

You should also make sure your computer has Mac OS Runtime for Java version 2.0 or later installed. To do so, check the version of the MRJLib file, which is in the MRJ Libraries folder (in the Extensions folder in the System Folder).

To log in to Remote Server Administration using an administrator user name that contains two-byte characters, such as Japanese, you must have Mac OS Runtime for Java version 2.1.1 or later installed.

To access Remote Server Administration from a Web browser on a computer with a European or Japanese system installed, make sure you have selected the correct language and default character set encoding in the Web browser. On Mac OS computers, you must also have Mac OS Runtime for Java version 2.1.1 or later installed to log in with an administrator user name that contains special characters.

If you are using Netscape Navigator or Communicator, open the Edit menu and choose Preferences, then open the Navigator category and select Languages. If necessary, click Add to add French, German, or Japanese to the list. Remove other languages from the list. Finally, open the View menu, choose Character Set, then choose Western (ISO-8559-1) as the character set for European languages, or Japanese (Shift_JIS) for Japanese.

If you are using Microsoft Internet Explorer, open the Edit menu and choose Preferences, then open the Web Browser category and select Language/Fonts. Open the Language pop-up menu and choose French, German, or Japanese. Then open the "Character set" pop-up menu and choose Western (Latin1) for European languages, or Japanese (Shift-JIS) for Japanese.

Issues with using Remote Server Administration

- For Internet aliases and group names, you can use only lowercase letters, numbers, and the underscore character.
- The Server Administration Help on your Mac OS X Server states that to troubleshoot problems logging into Remote Administration you should open the Process Viewer to confirm that the AdminWebServer and RemoteAdminServer processes are running. Instead of "AdminWebServer", you should see "apache".
- When you create or edit a user account, the user name and Internet alias can be the same.

Issues with Apple file services

- You cannot change access privileges for read-only volumes, such as CD-ROM discs. You can share folders on these volumes, but files are read-only for everyone.
- When a user logs in to Apple file services from a computer with AppleShare Client version 3.8.2 installed, the user's password is sent over the network in clear text form. Someone monitoring your network traffic could get the Administrator password, thus compromising your network's security. To correct this situation, upgrade client computers to AppleShare Client version 3.8.3. For information about this version of AppleShare Client, see http://www.apple.com/support.
- If the AppleTalk seed router runs on your Mac OS X Server, then to connect to Apple file services over TCP/IP you need to enter the router's TCP address in the TCP/IP control panel on each client computer. To do so, open the TCP/IP control panel on the client computer, choose Ethernet from the "Connect via" pop-up menu and Manually from the Configure pop-up menu, then enter the router's TCP address in the "Router address" box and complete the other information required for the connection. If the client is not connected to a router, then you can enter the server's IP address in the Router box in the TCP/IP control panel on the client computer.

Issues with the AppleShare Client software

- If AppleShare client computers have Mac OS 8.5 or later installed and AppleShare Client version 3.8.1 installed, files that users copy to server volumes may be corrupted in some cases. To prevent this, install AppleShare Client version 3.8.2 or later on all client computers that have Mac OS 8.5 or later installed. Apple recommends upgrading to the latest AppleShare Client software, version 3.8.3. To get the latest version of the AppleShare Client software, see http://www.apple.com/support.
- If you want to change the access privileges of an Apple file services volume from a client computer, only enter a user name in the Owner box and a group name in the User/Group box in the Sharing window.

Installation instructions
For further information, refer to installation instructions for both in article 59004: "Mac OS X Server: Patch and QTSS 1.0 Download Instructions."

Software Installation Instructions for Apple Products

This article will help to identify the recommended method of software installation for different models of Apple products, including desktop Macintosh computers, PowerBook, and Newton MessagePads.
This article has been archived and is no longer updated by Apple.
For all Macintosh computers, the steps below outline methods of installing any type of software, including System Software, applications, peripheral software (such as for a camera, display, modem, printer, scanner). Always refer to the Read Me document that came with your software for last minute updates.

Consult each heading below for software specific to your Apple product.

DESKTOP and POWERBOOK COMPUTERS
PERFORMA COMPUTERS
POWERBOOK 145B, POWERBOOK 150
NEWTON MESSAGEPAD

DESKTOP and POWERBOOK COMPUTERS

ANY software on floppy disk:

1. Start up the computer while holding the shift key down on the keyboard, until you see the "Welcome... Extensions Off (or Disabled)" message. Let go.
2. Follow the exact installation instructions provided with your software.
3. Restart normally, making sure you are NOT holding down any keys at startup.

ANY software on CD:

1. Insert the CD which contains your software. It should show up on the screen.
2. Now, follow the exact installation instructions provided with your software.
3. Restart normally, making sure you are NOT holding down any keys at startup.

PERFORMA COMPUTERS

For Performa computers, use all of the same steps above for **DESKTOP and POWERBOOK COMPUTERS** with the following exceptions:

- Your System CD that came with the Performa is entitled "Performa CD".
- For help understanding why Performa models are different than standard desktop computers, consult the following Knowledge Base article:
  article 12501: "**Performa: Backing Up and Restoring**"

POWERBOOK 145B, POWERBOOK 150

For these two PowerBook models, use all of the same steps above for **DESKTOP and POWERBOOK COMPUTERS** with the following exception:

- For help understanding why these two PowerBook models are different than standard PowerBooks, consult the following Knowledge Base article:
  article 17269: "**PowerBook 145B & 150: Backup and Restore Instructions**"

NEWTON MESSAGEPAD

Consult the following Knowledge Base articles:

- article 13855: "**Newton MessagePad: Installing System Updates**"
- article 36501: "**Newton Discussion Board: Frequently Asked Questions**"
- article 17339: "**Newton MessagePad: What Items Get Erased**"

Macintosh 0S 7.5.5: How to Make a Computer Ready to Use the Internet

This article explains how to make a Macintosh computer ready to use the Internet.
This article has been archived and is no longer updated by Apple.
Follow these steps to make a Macintosh computer ready to use the Internet:

1. Make sure your computer has the right version of system software.
   - Computers with a 68030, 68LC040, or 68040 microprocessor should have System 7.5.5 or later with Open Transport networking enabled.
   - Computers with a PowerPC microprocessor should have Mac OS 9.
2. Make sure your computer has enough memory (RAM).
   - Computers with a 68030, 68LC040, or 68040 microprocessor should have at least 16 MB.
   - Computers with a PowerPC microprocessor should have at least 32 MB (64 MB recommended).
3. Make sure your computer has the kind of modem and modem connection your Internet service provider (ISP) requires.
   - Many Internet services use dial-up, or analog modems. These kinds of modems connect to a computer's serial port. At a minimum, your modem should be able to transfer data at 14.4 kbps. A 56 kbps modem is recommended.
   - Digital subscriber line (DSL) and cable modems connect to a computer's Ethernet port. Not all Macintosh computers have an Ethernet port. If your computer does not have one, check with an Apple reseller to see if one can be added.
4. Subscribe to an Internet access service of your choice.
5. Install software provided by your ISP.
   - If your computer is using System 7.5.5, your ISP generally provides dial-up and support software. If your computer is using Mac OS 9, Remote Access dial-up software is already installed.
   - Your ISP may also provide you with an Internet browser, such as Netscape Navigator or Microsoft Internet Explorer, and an email program, such as Microsoft Outlook Express. These programs are part of Mac OS 9 and are automatically installed.

The following articles may assist you in setting up a computer to connect to the Internet:

- Article 24138: "**Open Transport: How To Upgrade From Classic Networking**"
- Article 75085: "**Open Transport: TCP/IP Configuration**"

Microsoft Office 98: How to Install

Microsoft Office 98 came with my Power Macintosh G3 computer. Do I need to install it?
This article has been archived and is no longer updated by Apple.
Apple has included Microsoft Office 98 with certain Power Macintosh G3 computers. The software is on a CD-ROM disc included with the computer. Office 98 must be installed before it can be used. Here's how:

There are two ways to install MS Office: drag-install from the installer CD, or run the traditional installer utility from the installer CD.

To drag-install, drag the MS Office folder from the CD to your hard drive. See Figure 1.

Figure 1: Drag-installing

The contents of the folder will copy over: then, the first time you launch one of the three applications from the hard drive (for example, Word), MS Office will complete the installation by installing needed extensions. No additional action is required by the user. During this "first run" of an Office application, startup is delayed a few seconds while the extensions installation takes place. That's all there is to the drag-install process.

The second way to install MS Office is to run the installer program that comes on the CD. The installer is located in the Office Custom Install folder of the CD, and like traditional Macintosh installers, allows you to either perform an Easy Install or a Custom Install.

Regardless of how you install MS Office, successful installation adds a folder named "Microsoft Office 98" to the hard drive. See figure 2.

Figure 2: The Microsoft Office 98 folder

What general information do I need to know about launching MS Office, creating and saving a document, and quitting MS Office?

The very first time you launch an MS Office application after installation, you will need to wait while the software checks for (and if needed, installs) the necessary extensions. Otherwise launching MS Office applications is quick, and the process of creating and saving documents is standard for Macintosh applications, as is quitting. We will cover specific examples later, in the hands-on lab.

Where are the various MS Office components located?

In addition to the Microsoft Office 98 folder discussed above, the MS Office installer creates or changes the following folders within the System Folder:

(added to) Extensions:

- Internet Config Extension
- Microsoft Component Library
- Microsoft Hyperlink Library
- Microsoft OLE Automation
- Microsoft OLE Library
- Microsoft RPC Runtime Library
- Microsoft Structured Storage
- MS Font Embed Library (PPC)
- Text Encoding Container
- MS C++ Library (PPC) (in MS Library Folder)
- MS Configuration Lib (PPC) (in MS Library Folder)
- MS Container Lib (PPC) (in MS Library Folder)
- MS Favorites Library (PPC) (in MS Library Folder)
- MS Internet Library (PPC) (in MS Library Folder)
- MS Parser Library (PPC) (in MS Library Folder)
- MS Preferences Library (PPC) (in MS Library Folder)
- MS Variant Lib (PPC) (in MS Library Folder)
- Standard OLE Types (PowerMac) (in Type Libraries folder)
- Standard OLE Types 2 (in Type Libraries folder)
- vba en olb (PowerMac) (in Type Libraries folder)

(added to) Control Panels:

- Configuration Manager

(added to) Fonts:

- Arial
- Arial Black
- Impact
- Monotype Sorts
- MT Extra
- Symbol
- Times New Roman
- Wingdings

(new folder created named) MS Preference Panels:

- Advanced Networking
- Cookies
- File Helpers
- General E-mail
- Home and Search
- Password Dialogs
- Protocol Helpers
- Proxies
- Ratings
- Security
- User Passwords

(added to) Text Encodings:

- Arabic Encodings
- Central Euopean Encodings
- Chinese Encodings
- Chinese Encodings Supplement
- Cyrillic Encodings
- Greek Encodings
- Hebrew Encodings
- Indic Encodings
- Japanese Encodings
- Korean Encodings
- Symbol Encodings
- Thai Encodings
- Turkish Encodings
- Unicode Encodings
- Western Language Encodings

(added to) Preferences:

- Internet Preferences
- Excel Chart Gallery (8)
- Graph Chart Gallery (8)
- Word Font Substitutes

(added to) Preferences (first time an MS Office application is run):

- Microsoft Office Settings (8)
- Office Registration Cache
- PPC Registration Database

(added to) Preferences (first time Excel is run):

- Excel Settings (8)

(added to) Preferences (first time PowerPoint is run):

- PowerPoint Settings (8)

(added to) Preferences (first time Word is run):

- Custom Dictionary
- Embedding Preferences
- MS Office ACL (8)
- Word Font Menu Cache (8)
- Word Settings (8)

How To Turn Off Your Macintosh

This article explains how to shut down a Macintosh computer.
This article has been archived and is no longer updated by Apple.
Your Macintosh should be shut down, not just turned off. To shut down a Macintosh, switch to the Finder and choose the "Shut Down" command from the "Special" menu.

Figure 1, Shut Down command

You can also press the power key on the keyboard to shut down the computer. Pressing the power button displays a dialog box with options to restart, sleep, cancel, or shut down the computer. Click the button of your choice.

Figure 2, Shut down dialog box

During the shut down process, your Macintosh quits all open application programs. If you have not saved your work, most applications will give you the opportunity to do so during the shut down process. After all applications have been quit, the Macintosh turns itself off.

iPod Dock: Specifications

This document outlines the specifications of the iPod Dock.
This article has been archived and is no longer updated by Apple.
The iPod Dock makes charging and syncing easier than ever. A convenient and elegant home base for iPod on a desk or connected to a home stereo system, the dock provides syncing via FireWire or USB 2.0, charging via FireWire and a stereo line out for simple connection to powered speakers or a stereo system.

Figure 1 iPod Dock

1. iPod Connector
The iPod can easily be inserted and removed from the iPod Dock.

2. Audio Line Out port
The audio line out port is line level. Insert a cable here to connect iPod to a stereo, or to external powered speakers.

3. iPod Dock Cover
For more information on the iPod Dock Cover see technical document 61912, "**iPod (with Dock Connector): How to Install Dock Cover M9130G/A**".

4. Cable Connection
You can connect either the iPod Dock Connector to FireWire Cable, or the iPod Dock Connector to FireWire and USB 2.0 Cable to the iPod Dock. For more information about iPod cabling see technical document 61913, "**iPod (with Dock Connector): About the Dock Connector and Cables**".

The iPod Dock is not included with all iPod (with Dock Connector) models, but can be purchased separately.

The iPod Dock can only be used with the iPod (with Dock Connector) models. Previous iPod are not compatible with the iPod Dock.

To identify iPod models see technical document 61688, "**iPod: How to Identify Models**".

AppleShare IP 6.1: Read Me

This article comprises the Read Me for AppleShare IP 6.1. The contents include:

Introduction
Installation and Documentation
Requirements for Running AppleShare IP 6.1
Support
Notes About AppleShare IP 6.1

Article 58287: **AppleShare IP Web & File 6.1.1 Update Read Me** contains additional information which may be useful.

On May 24, 1999, Apple introduced its integrated file, print, web and mail server software suite, AppleShare IP 6.2. On the same day, Apple introduced an upgrade program for certain customers using earlier versions of AppleShare IP.

This article has been archived and is no longer updated by Apple.

Introduction

AppleShare IP 6.1 is the follow-on release to AppleShare IP 6.0 and builds on the existing AppleShare IP product by continuing to provide the complete suite of LAN and Internet services, including Web, File, Mail and Print services. New features for version 6.1 include support for Mac OS 8.5, Web-based remote administration, TCP Filtering, secure printing, multi-domain support in the Web Server, shared IMAP folders, and general performance enhancements and improvements. AppleShare IP continues to be fully compatible with Macintosh and Windows clients. AppleShare IP retains its traditional ease of use with a single administration console, making it simple to manage AppleShare users, groups, passwords and security.

Installation and Documentation

Complete installation instructions are contained in the Getting Started manual. Additional help can also be found in the AppleShare Client 3.8 User's Manual, and in the AppleShare IP Help and Remote Help, all of which are included with your AppleShare IP 6.1 software.

Requirements for Running AppleShare IP 6.1

Power Macintosh computers running AppleShare IP 6.1 Server

- CPU: Any Apple Power Macintosh computer or Macintosh Server with a PowerPC(TM) G3, 604e, 604, 603e 6500 series, or 601 microprocessor.
- RAM: 48 MB of memory with virtual memory turned on; 64 MB with virtual memory turned off. More memory may be needed if you are using one or more web server plug-ins.
- System Software: Mac OS 8.5 is recommended and is provided as part of your AppleShare IP Server software. TCP Filter software requires Mac OS 8.5; all other features require Mac OS 8.1 or later.
- Ethernet drivers: Apple Enet 2.0.1 is required, and is installed by the AppleShare IP installer. If you install on Mac OS 8.1, note that the older extension, called "Ethernet (Built-In)" is not removed.

Macintosh computers running AppleShare Client 3.8.1

- System Software: Mac OS 8.5 is recommended. The minimum requirement is Mac OS 7.6 or later with Open Transport 1.1.2 or later.
- AppleShare Client 3.5 or later is required for connecting to an AppleShare IP 6 server. However, Apple strongly recommends that you upgrade your client Macintosh computers to Mac OS 8.1 or later and AppleShare Client 3.8 or later.

Support

Telephone Support

In the United States, if you have questions about AppleShare IP 6.1 that are not answered by the Getting Started manual or AppleShare IP Help or Remote Help, call the Apple Assistance Center at 1-800-APL-CARE (1-800-275-2273) during telephone support hours (Monday through Friday, 6 am to 6 pm Pacific time). When prompted, enter the support access number provided on the back of your Apple Support Card and follow the instructions.

If you are located outside of the United States, refer to the support information that came with your AppleShare IP 6.1 software for instructions.

AppleShare IP Mailing List

To receive information about software updates, you are cordially invited to join the AppleShare IP mailing list. By joining the mailing list, you will also have the opportunity to share your experiences, questions, and comments with others using the software. Apple employees monitor the list, but Apple does not guarantee that any questions directed to this list will be answered.

Notes About AppleShare IP 6.1

- If a computer that is running AppleShare IP crashes, check your hard disks by running Disk First Aid before you start any service again. Disk First Aid is located in the Utilities folder on your Mac OS CD ROM disc. If you are running Mac OS 8.5, the system will check only the startup disk automatically, so you should still check any other disks with Disk First Aid.

Installation

* The AppleShare IP Installer will sometimes miscalculate the amount of space available on extremely large volumes. If, during the installation process, you receive a warning that there is not enough space to install AppleShare IP, try temporarily backing up and removing some items from the disk onto which you are trying to install (or install on a smaller drive partition, if available), and then begin the installation process again.

* If you are doing a custom installation, the installer will still install the Web & File extension, though it will not run. This extension is required for you to be able to edit Users and Groups.

* Although TCP Filter software requires Mac OS 8.5, as stated above, the Installer will install it on Mac OS 8.1-based computers. If you attempt to run the software under Mac OS 8.1, it will display an error and quit.

Registry

- The AppleShare IP Registry will convert your Users & Groups file to run with AppleShare IP 6.1 the first time you reboot with AppleShare IP installed. Since this file will no longer work with Personal File Sharing after the conversion, a copy of the original file is placed in your Preferences folder. The file is named Users & Groups Data File Backup. The copy of the original file may be used if you decide to restore your machine to Personal File Sharing after performing a "custom remove" of AppleShare IP 6.1.
- If you upgrade from one language of the server to another (for example, if you participated in the AppleShare IP seed program and tested the US version of the software, but you've upgraded to another version in your local language), you will lose your Users & Groups information if you upgrade. To preserve your setup, rename the file "Users & Groups Data File" to the appropriate name for your country, and restart your server before upgrading.

Web & File Server

- Sherlock is compatible with the AppleShare IP File Server, provided you ensure your server and clients are set up similarly. First, Sherlock indices must be created on the server, not on the client (this also saves time since the index only needs to be built once). Also, since Sherlock works with disks, you must share entire disks so that Sherlock on the client machines will recognize the indices created by the server. Because Sherlock uses dates and times to maintain its indices, the client and server times and time zones must be the same. Finally, because Sherlock is language aware, you must use the same localized system or language kit for Mac OS on the server to create an index as you use on the clients which use that index. Similarly, if either the server or the client has "Multilingual Internet Access" installed, the other should also have it installed, and if either the server or the client has the Japanese plug-in tokenizer installed, the other should also have it installed.
- If you receive a message stating that error -30523 has occurred in a Sherlock client, verify that you do not get the same message on the server machine itself. If you do, then delete and rebuild the index on the server. If you do not, and the client and server are using the same localized version of Mac OS, then there may be a problem with some of the disk dates. You may be able to fix this problem by backing up your data, erasing the disk using the "Erase Disk" command from the Special Menu in the Finder, and restoring your data.
- The AppleShare IP 6.1 Web & File Server will automatically adjust the configuration of the server according to the amount of memory available. When 12MB or less of memory is available to the AppleShare IP Web & File Server, the server will configure itself in standard mode, similar to AppleShare IP 5.x. When there is more than 12MB of additional free memory available at the time the server launches, the AppleShare IP Web & File Server configures itself in high performance mode, at the cost of an extra 3MB of memory. High performance mode provides greater performance and scalability through an increased number of internal buffers, larger buffer sizes, a maximum concurrent connection limit for file services of 500, and a maximum concurrent connection limit for web server requests of 150.
- AppleShare IP 6.1 may not behave correctly when used with Retrospect 4.1. Specifically, the server may not shut down or disconnect users when requested to do so by Retrospect. It is possible to avoid this problem by scripting your backups with AppleScript.
- The Adobe Acrobat(TM) Installer cannot be used while the Web & File Server is running. Be sure to install Adobe Acrobat before you start the Web & File Server.
- Do not launch the Web & File Server with AppleTalk turned off; various pieces of AppleShare IP require AppleTalk to be turned on, and the software may not work correctly if AppleTalk is turned off.
- AppleShare IP 6.1 is not compatible with ARA Multiport Server software. You should not run them on the same computer.
- Under some circumstances you may not be able to install PC applications from Windows File Sharing Server. To perform net installations of applications that are partitioned on multiple floppy disks, create a folder 'X' and copy each disk as a separate subfolder. Then make the parent folder 'X' a share point. From the client, connect to the share point and perform the installation.

- If you decide to host multiple web sites using the Multi Domain Plugin, be sure to examine the "Plug-In Messages" file after you've started the web server. If the Multi Domain Plugin encountered any errors while reading your "Multi Domain Settings" file, it will write error information to the "Plug-In Messages" file.
- Because of a driver problem, it is not possible to share PC-format ZIP(TM) disks. Mac OS format ZIP(TM) disks can be shared without problems.
- If you're using Windows File sharing, you may wish to increase the number of times your users can enter an invalid password before having their access revoked, because some Windows clients will resubmit invalid passwords several times to the server on the user's behalf (after which they give up), causing the count of the number of attempts to be artificially inflated. Alternatively, have your users use the same password on AppleShare as they do for other Windows services in your network.
- A known issue on Microsoft Windows 98 does not report a volume's total free space correctly. A share point for a volume that is 2GB or greater will show that 1.99GB free space and 0 user space. This is a cosmetic issue and should not affect the ability of Windows clients to use the share point.
- The AppleShare IP specification for "Total Share Points allowed" is 150, which includes both share points and mounted volumes.
- The AppleShare IP Web & File server may hang with virus protection installed. If you experience such problems, try removing or disabling your virus protection software.

AppleShare Client 3.8.1

- If you are running Mac OS 8.5, the AppleShare client, and have virus protection installed (such as NAI's Virex 5.9 or Norton Anti-Virus 5.0), you may experience system hangs on client machines when connecting to an AppleShare server. If you experience such problems, try removing or disabling your virus protection software.
- For additional items, please refer to the AppleShare Client Read Me.

Mail Server

- There is a problem with Netscape Communicator 4.5 and AppleShare IP 6.1 IMAP support. Although the AppleShare IP 6.1 Mail Server supports nested IMAP folders, Communicator will not properly display these nested folders. The folders are still present and all mail in them is still intact -- the nested folder simply fails to appear in Communicator's mailbox browser. If your AppleShare IP mail account contains nested folders, you will not be able to access them with Netscape Communicator 4.5. At this time Apple recommends the use of other IMAP clients for access to nested folders. The AppleShare IP 6.1 Mail Server is fully compatible with a number of other IMAP clients that offer full support for nested folders, including Nestscape Communicator 4.04.
- The AppleShare IP 6.1 Mail Server can not use previous versions of AppleShare IP 5.0.x mail Databases. If you have critical mail that you do not want to lose, you must download those messages from the AppleShare IP 5.0.x Mail Server before running AppleShare IP 6.1. Or if downloading mail is not an Option, the AppleShare IP Mail Tool 6.1 can convert 5.0.x Mail Databases to AppleShare IP 6.1 Databases.
- It is not necessary to update the AppleShare IP 6.0 Mail Databases to 6.1 Mail Databases with the AppleShare IP Mail Tool, as this will be done automatically when launching the AppleShare IP Mail Server 6.1. The AppleShare IP Mail Database 6.0 and 6.1 are interchangeable with the AppleShare IP Mail Server 6.0 and 6.1.

Web-based Remote Admin

- To use Internet Explorer as your Web browser, please set the Java preferences to use the "Apple MRJ" setting. Confirm that your computer is running Macintosh Runtime Java (MRJ) 2.0 or later by checking the version of the MRJLib contained in the MRJ Libraries subfolder of your Extensions folder. This release is incompatible with Internet Explorer when configured to use the Microsoft Java Virtual Machine.
- When attempting to log on multiple times to Remote Admin in the same Internet Explorer session, you should use the Log on link available on the Log out page or select the Refresh button in the browser to receive a fresh Log on page.
- Do not use the "Never" option in the Netscape Browser's Advanced Cache settings when running with Remote Admin. This option suppresses the browsers requests to get fresh pages and thus will result in out of date information being displayed.
- Web-based Remote Admin will not work properly if the "Remote Admin" folder inside your Default Web Folder is moved or renamed. Do not move, rename or delete the "Remote Admin" folder or its contents unless you are configuring your Web Server for multiple domains.
- If you have configured your Web Server to support multiple domains then you must move the Remote Admin folder from the Default Web Folder specified in the Web Settings panel to the "web folder" specified in the first entry of your Multi Domain Settings file. In order to access Remote Admin from the new location, you must use the host name or IP address specified in the first entry in your Multi Domain Settings file when entering the Remote Admin URL.
- When using Remote Admin with European keyboards on non-localized Mac OS systems, you must specify the appropriate settings for your keyboard in the Web browser. For Internet Explorer, check the Language/Fonts settings in your Internet Explorer Preferences. For the Netscape Browser, check the Encoding settings.
- When trying to access Remote Admin on a heavily loaded server, you may receive the "504 Gateway Timeout" message in your Web browser. Use the Web & File Admin application to set the Current User Activity to less than the maximum value to allow more processing time for the Remote Admin server application.
- For this release of Web-based Remote Admin, administrators may only log on with 7 bit character passwords and may only set user passwords in this range. The 7 bit character range is the standard ASCII character set including the control characters, alphanumerics, and standard keyboard characters. You can continue to use Web & File Admin to set 8 bit passwords but administrators will not be able to use

these passwords for log on to Remote Admin.
- Do not refresh or reload a page within Remote Admin. You will have to log on again.
- A limitation in Netscape Java does not allow the 'caps lock' key to be recognized. A Remote Admin user should use the 'shift' key when entering upper case letters in a password.

Print Server

- To use the AppleShare IP 6.1 Print Server's password security for print queues, the print client must have the LaserWriter 8.6.1 driver installed. This version of the LaserWriter driver is not yet available. Please check our website (www.apple.com/appleshareip) for updates regarding its availability.
- When creating or renaming print queues from Remote Admin, the AppleShare IP Print Admin application will not see the new queue names until the next time it is launched.
- It is recommended that a queue only contain printers of the same model and type. Also, printer features present in the first printer attached, but not present in subsequent printers, may cause print errors when jobs are printed to one of the subsequent printers.
- The "Allow binary data" and "Allow color printing" options are only used with AppleTalk print queues.
- Some LPR clients do not support queue names that include spaces. Therefore, the AppleShare IP Print Server will also recognize the name up to the first space. For example, if the print queue name is 'Accounting Department', the queue name 'Accounting' can be used by an LPR client to print to the same queue.
- Windows NT printer drivers are not compatible with the secure printing feature for print queuing. Do not enable security on a print queue if Windows NT clients use it.
- With secure printing activated, a Postscript file copied or sent from one client to another for printing may not work.

Documentation

- If you are experiencing any problem while printing the PDF documents that are included on the AppleShare IP 6.1 CD, increase the memory allocated to Adobe Acrobat(TM) application by 2MB.
- The AppleShare IP Help is html-based and uses Apple Browser Launcher to open the files within your default Web browser. Please note this browser launcher may fail to launch the Help system if you change the name of the AppleShare IP 6.1 folder at the root level of the hard disk or place the AppleShare IP 6.1 folder inside another folder. The alias for the AppleShare IP Help inside the AppleShare IP 6.1 folder will still work.
- The AppleShare IP Remote Help incorrectly states that you can remove a printer assignment from a queued job using Remote Admin. You must use the AppleShare IP Print Admin to perform this function; it is unavailable remotely.
- The 'AppleShare IP Help Launcher' brings up a dialog saying "Please wait a moment" with two lines of special characters. This is not in error. The Help Launcher works correctly.

AppleShare IP 6.1: Remote Administration

AppleShare IP 6.1 supports remote administration. Using a standard Web browser, the server administrator can perform most tasks remotely, such as creating new users, changing passwords, or starting or stopping mail or print services.

This article contains the following sections:

- Setting Up Remote Administration
- Remote Admin interface
- What tasks cannot be performed remotely
- Remote Admin Security
- Troubleshooting Tips

This article has been archived and is no longer updated by Apple.

Setting Up Remote Administration

Remote administration of the ASIP 6.1 server requires the following:

- The Web & File Server must be running. Although you can start and stop other services (mail and print) remotely, the Web & File Server must be running to do any remote administration.
- Both Web access and Web Plug-Ins must be enabled. Set appropriate privileges to the default Web Folder (the administrator needs at least read access). If you change the Default Web Folder, be sure to move the Plug Ins and Errors folders to the new location.
- Remote Web Administration must be enabled; this is done in the Web & File Server Settings window, under "General". It is set to enabled by default.

Figure 1, Web & File Server Settings window

- You will need TCP/IP access to the server from the client machine. This can be over a LAN, WAN or a dialup connection. If using TCP Filtering (or a firewall), make sure that no filters are set up that would prevent the client machine from accessing the server on the Web Admin port (311).
- The Web browser used must be Netscape Navigator 3.0.1 or greater, Netscape Communicator 4.0 or later, or Microsoft Internet Explorer (MSIE) 3.0 or later. Apple strongly recommends Netscape Communicator 4.0 or later, or MSIE 4.0 or later. Other web browsers that support frames and Java might work, but they have not been tested and are not supported.
- To access Remote Administration, use the following URL:

```
http://your.server.com/.admin
```

You will be prompted to enter the administrator name and password.

Figure 2, Remote Server Administration log on window

- Read the ReadMe files for any late-breaking news about known issues or compatibility problems.

Remote Admin Interface

If you are familiar with performing administrative tasks at the server itself, you'll have no problem following the Remote Admin interface. (And if server administration is still unfamiliar to you, review the appropriate sections of the ASIP 6.0 training module, or on-line help files, to become familiar.) The Remote Admin interface is intuitive and mostly self-explanatory.

This toolbar appears on every page, and allows you to move easily between the different server components. The Status section will show you what services are enabled and running, and allow you to start or stop mail and print servers. (Web & File Services must be running at all times in

order to access Remote Administration.)

Figure 3, Remote Server Administration toolbar

The screenshot below shows the interface for managing users.

Figure 4, Remote Server Administration interface

This screenshot shows the options for managing Web Server Settings. As you can see, they closely mirror the options as they appear in the AppleShare IP Web & File Admin program.

Figure 5, Web Server Settings options

One nice feature that Remote Administration adds is the Usage History graph. This can be especially useful in troubleshooting; for example, if users reports that they found the server slow in the morning, you can use this chart to see how busy the server was at that time.

Figure 6, Web & File Server Activity Window

What tasks can't be performed remotely?

Some tasks still require you to be at the server itself; these are listed below:

AppleShare IP Manager
All of the AppleShare IP Manager functions are available in Remote Admin except launching the server-based administrative applications. See the Status page of Remote Admin.

Users & Groups
The following functions are NOT available in Remote Admin:

- Import Users and Export Users & Groups
- Duplicate User and Duplicate User Multiple features
- Batch attribute setting feature.

Web & File Admin
Start is NOT available since Remote Admin requires the Web service to be running at all times.
User and groups names must be typed in for setting access privileges.
Other functions NOT available are:

- Duplicate Folder
- Unmount Disk
- Web & FTP Mime Settings
- Reset cache
- Serialization Setting
- Send Message to Connected Users

Mail Admin

The following functions are NOT available in Remote Admin:

- Date & Time Modification on server
- Viewing and Managing mail messages on the server (NOTE: you can use IMAP Admin Access Port for this functionality)
- Attempt outgoing connections to Mail Hosts.
- Show pending messages for Mail Hosts. (NOTE: you can use IMAP Admin Access Port for this functionality)

Print Admin
The following function is NOT available in Remote Admin:

- Clear all Logs
- Remove a printer from a queue

Remote Admin Security

Every server administrator should be concerned about security. Remote Administration can be secured in the following ways:

- **Password security**: The client must provide the name and password of a server administrator to gain access.
- **Automatic LogOut**: The Remote Admin connection will close after a short period of inactivity; this will prevent unauthorized use if you are unexpectedly called away from your workstation.
- **TCP Filtering**: Using the TCP Filter Admin program, you can create a filter that would allow access to the Remote Admin port only from your own workstation, or from certain networks.
- **Disable Remote Administration**: You also could simply disable the feature altogether.

Troubleshooting Tips

Here are some general guidelines on how to troubleshoot problems accessing the server for remote administration:

- Review the steps listed under "Setting Up Remote Administration" above to verify configuration. In particular, confirm that Web service or Plug Ins have not been disabled due to an error, such as bad IP configuration or a low memory situation.

- Try accessing the server's default Web page; this will let you know whether its Web services in general, or remote administration in particular that is causing the problem.

- If the problem appears to be with accessing Web Services in general:
    - Try pinging the server, to test IP connectivity.
    - Try connecting from another workstation, to determine if the problem is at the client or the server. If possible, try connecting from a device on the same LAN as the server itself.
    - See if TCP Filtering is enabled, and carefully review the filters. You can also try disabling TCP Filtering at the server.
    - If Multi Domain support is enabled, test connections to the various domains.

- If the problem appears to be specifically with Remote Administration:
    - Verify the URL being used. It should be the domain name of the server, followed by "/.admin", without the quotes:

```
http://www.company.com/.admin
```

    - Verify that the name and password being entered are correct, and that the user is set up as a server administrator.
    - Verify that the Plug Ins folder is within the default Web Folder, that it contains the Remote Admin Folder, and that access privileges to all of the folders allow the administrator at least read access.
    - Verify that Plug Ins have not been disabled.
    - Verify that there's enough free RAM on the server to accommodate the Remote Admin.cgi.
    - If Multi Domain Settings file has been configured, the first domain listed in that file will be the default for Remote Admin. View the Plug Ins Messages file (found in Preferences:AppleShare IP Preferences:HTTP Logs:) to see what path is being searched for the Remote Admin cgi, and edit the Multi Domain Settings file if needed.
    - Verify that you're using a tested Web Browser; check that Java is supported. If using Internet Explorer, check to see if it is set to use Apple MRJ (Mac OS Runtime for Java), rather than Microsoft's Java Virtual Machine.

AppleShare IP 6.1: Web Server Multi Domain Support

MultiDomain Support allows you to configure your Web server to host different web sites. A unique home page can be served for each site, a function of the URL used at the client. This is useful for Internet Service Providers, or other server administrators who manage a Web Server for various customers, each of whom want the URL to their home page to reflect their domain or company name.

This article contains the following sections:

- Setting up Multi Domain Support
- Troubleshooting Tips
- Setting up Secondary IP Addresses for the ASIP server.

This article has been archived and is no longer updated by Apple.

Setting Up Multi Domain Support

This section describes how to set up your Web Server to support multiple domain names. There are two approaches to this:

- If visitors to your web site have web browsers that support HTTP 1.1 or greater, you can use just one IP address for your server, with multiple domain names mapped to that one IP address. With an HTTP 1.1 compliant client, the domain name is passed along to the server, and the server uses that unique domain name to determine which home page to serve to the client.
- Earlier specifications of HTTP did not require the client to submit the domain name to the server; only the IP address was sent. For these clients (for example, versions 2.0 of Netscape and Internet Explorer, or Mosaic 2.0.1), you must set up multiple (i.e. secondary) IP addresses for your server (using the single-link multihoming feature of Open Transport), and have your DNS tables map each of your client's domain name to a different IP address. (Consult your network administrator for the unused IP addresses you will need.) When the client sends a request to the Web Server, the server will use the IP address the client used to determine which home page to serve to the client.

The instructions below address the first method; if you decide to use multiple IP addresses, see the note at the bottom of this page for assistance in setting up multiple IP addresses, then follow the instructions here with this exception: have your DNS tables map each domain name to the appropriate (i.e., different) IP address, and include the IP addresses in the Multi Domain Settings file, rather than the domain names for these sites.

Step 1: Create separate web folders for each domain.

AppleShare IP 6.1 allows you to configure the Web Server to host up to 50 domains. For each domain, create a folder on the hard disk that will include a default.html page. For example, you might have 3 clients: Alpha, Baker, and Charlie. Make a folder named "Alpha" that contains the default web page, other pages, and media, that you want visitors to see when they visit the Alpha site. Do the same for Baker and Charlie. The folders can reside anywhere on the hard drive.

The folders might look like:

Figure 1 AppleShare web folders

Step 2: Create appropriate DNS entries for each domain.
Each domain name will need an entry in your DNS tables, mapping it to the IP address of the server. In the example below using MacDNS, our domain is "company.com", but zone files have also been created for each of our customers :

<IMG SRC="http://www0.info.apple.com/images/kbase/60019/60019_2.gif">
Figure 2 Examples of domain name entries in DNS tables

Note that each domain name above is mapped to the same server. No matter which domain name is used in the URL (www.alpha.com, www.baker.com, etc.), the IP address returned will be 17.104.104.89, thus all requests will go to the same ASIP server.
Note also that, when preparing Web sites that will be available on the InterNet, each domain name must be registered with InterNIC, and the IP address of the primary name server for each domain specified; otherwise, other name servers and clients on the Internet will not be able to resolve those domain names.

Step 3: Create the Multi Domain Settings file

You will find a plain text file called "Multi Domain Settings," in the "Plug Ins" folder in your default Web Folder. Use SimpleText to open and edit that file.

The syntax for Multi Domain Settings file is described below. Each line of the file contains either the domain name or IP address, the port number, and the path to the web files for that domain on the server.

- domain name or IP address
  - Both can be used within the same Multi Domain Settings file; in fact, it's a good idea to list both your domain name with path, and to specify which page should be served if someone connects using the server's IP address.
  - Use domain names for your "customers" when you are using a single IP address at the server and will have HTTP 1.1-compliant clients connecting. In this case, the unique domain name will be what the server uses to determine what web pages to serve.
  - Use the IP addresses when you have multiple IP addresses configured for the server (using single-link multihoming).
- port number
- path to web files on the server

Note that the path of the first entry will be used to locate the Remote Admin cgi.

This is an example of the contents of a Multi Domain Settings file; while this example shows using port 80 for each domain, a different port number could be selected (just make sure the port number you select is not used by another application running on the server.

Extract from a Multi Domain Settings file:

```
dns=www.company.com port=80 path=Macintosh HD:Web Folder:
dns=17.104.104.89 port=80 path=Macintosh HD:Web Folder:
dns=www.alpha.com port=80 path=Macintosh HD:Client Folders:Alpha
dns=www.baker.com port=80 path=Macintosh HD:Client Folders:Baker
dns=www.charlie.com port=80 path=Macintosh HD:Client Folders:Charlie
```

Note that the first site specified is going to be our default, and the domain/path through which Remote Administration will be used. In the second line, we are specifying what page we want served if someone uses the IP address of the server to connect, rather than a domain name. The following lines define the paths for our customer folders.

Step 4. Settings in Web & File Admin Program

Verify in the ASIP Web & File Admin program that:

- Web Services are enabled
- Web Plug-Ins are enabled (Plug In Messaging is also very useful for troubleshooting purposes, so turn that on as well.)
- Appropriate privileges have been set up for each folder containing web pages that need to be served: each of your customer folders, as well as the default Web Folder.

Stop and restart the Web & File Services, for the Multi Domain Settings file to be recognized.

Step 5. Test from a client

Test the Multi Domain configuration by connecting to the web server from any client, using each of the domain names you set up: www.alpha.com, www.baker.com, www.charlie.com, and www.company.com.

If Plug In Messaging has been enabled in Web & File Server Settings, you can also check the Plug In Messages file found in System Folder:Preferences:AppleShare IP Preferences:HTTP Logs: to view the list of sites your server is ready to support.

NOTE: Using the same domain name with multiple ports does not work. For example, having www.company.com serve Alpha's page at port 8070, Baker's page at 8080 and Charlie's page at 8090, is not supported in this version (may be implemented in future).

Troubleshooting tips

- If problems arise, verify correct configuration as follows:
- Verify that Web Service and Web Plug Ins are enabled.
- Verify that privileges to the default Web Folder, and to your customer's web folders, and all enclosed folders, are set up correctly.
- Make sure that the domain names being used at client can be resolved. A utility such as MacTCP Watcher, DNS Lookup, or the Find IP Address feature of TCP Filtering Admin program can be used. If the domain names cannot be resolved, look into DNS issues.
- Make sure that the Multi Domain Settings file is a text file, named correctly, formatted properly and located in the Plug Ins folder of the default Web Folder (the folder specified in Web & File Admin program).
- Make sure that the paths indicated in the Multi Domain Settings file contain no typos and are accurate. There should not be blank spaces following the colons which delineate folders names. Remember that if any files are moved around on the server, or the names of disks or folders changed, the paths may no longer be accurate.
- If Plug In Messaging is turned on, view the Plug In Messages file for a list of sites that the server is ready to support.

- Verify that each of the web folders has a default.html page (the name of the default page to serve must match what has been set up in the Web & File Server Settings:Web screen); open the page locally using an HTML editor or browser to compare it against whatever page (if any) is being served to the client.
- Check TCP Filtering to make sure that no filters would prevent access to the Web port from the client computers.
- If using ports other than the default HTML port 80, make sure the port numbers are not being used by other services.
- Utilities like MacTCP Watcher could be used to view what ports the server is listening on; with this application open, choose "Show Connection list" from the File menu.

Setting up Secondary IP addresses on the ASIP server

The second way of configuring the ASIP server for multi domain support is to set up secondary IP addresses at the server, and have the clients' domain names mapped to the secondary addresses. Open Transport 1.3 or later and a PCI-based server is required to support this capability, which is called 'single-link multihoming', 'IP multinode support', or 'IP aliasing.'

This method is needed when clients are using older browsers (such as Mosaic) which may not support HTTP 1.1; in these cases, the domain name the client used in the URL is not passed to the server; only the IP address is. Thus, the ASIP Web Server must use the IP address to determine what home page to send to the client. When using this method, you should use IP addresses, rather than the domain name, in the Multi Domain Settings file.

- **Step 1: Verify that the server's primary IP address is static and configured manually.** Open the TCP/IP control panel to verify.
- **Step 2: Create an "IP Secondary Addresses" file**; this will be a plain text file that will contain the information on the secondary IP addresses. This file needs to be saved into the Preferences folder of the System Folder.

  Within this file, each line begins with "ip=" followed by a secondary IP address. If the subnet mask and router address are different from those used by the primary IP address, they should be specified also, preceded by "sm=" and "rt=", respectively. Here is an example; note that the first line which begins with a semi-colon is a comment.

```
;ip address subnet mask router address
ip=192.1.1.4 sm=255.255.255.0 rt=192.1.1.1
ip=192.1.1.5
ip=192.1.1.6
```

- **Step 3: Restart the server and test.** Using a ping utility like MacTCP Watcher (you can locate and download this handy utility from various ftp sites on the Internet), try pinging each of the secondary IP addresses you've set up for the server.

AppleShare IP 6.1: TCP Filtering

This article describes how to use the TCP Filter Admin program to control access to the ASIP 6.1 server. It includes the following sections:

- What is TCP Filtering?
  - System requirements/Compatibility
  - Components installed
- How it works
- Creating, Editing, Duplicating, and Deleting Filters
- Troubleshooting Tips

This article has been archived and is no longer updated by Apple.

What is TCP Filtering?

TCP/IP Filters allow the server administrator to restrict access to TCP services running on the ASIP server by port number, by IP address of the client, or a combination of both. This powerful feature allows the administrator a great deal of flexibility in offering services and providing extra security. Here are some examples of how an administrator could filter services on the ASIP server:

- Limit all access to specific networks, such as the local LANs; this would prevent users on the Internet from accessing the server.
- Restrict a particular service, such as Remote Web Administration or the IMAP Admin Access Port, to a single IP address. This would allow additional security to these powerful administrative features.
- Permit server access to all clients within an IP address range, except for particular workstations. This might be used if you have some "public" workstations, such as you might find in a library or a business lobby. These public workstations could be set up with only certain types of access, such as access to the web server, while other access (FTP, SMTP, or AFP over TCP) is denied

TCP/IP Filtering includes a TCP Filter Admin program which is used to create the filters (like other ASIP administration programs, launching the TCP/IP Admin program requires the admin name & password). The other components are extensions which interpret the filters created and allow or deny services accordingly.

Figure 1, TCP Filter folder contents

System Requirements/Compatibility

Operating system

The TCP Filter feature is fully compatible with Mac OS 8.5 which includes Open Transport 2.0. It is not supported, and may not run on, 8.1 or earlier due to limitations in earlier versions of Open Transport.

Hardware

The TCP Filter feature will run on any supported hardware platform of the AppleShare IP 6.x product.

Components Installed

TCP/IP Filtering is installed as a standard part of the AppleShare IP 6.1 easy installation, and is implemented in 3 components:

- OT AutoPushSupport init (located in Extensions Folder)
- TCP Filter extension (located in Extensions Folder)
- TCP Filter Admin application (located in TCP Filter folder, within the AppleShare IP 6.1 folder at root level of startup volume)

The TCP/IP Filtering extension module verifies all incoming TCP/IP packets and the admin application is used for configuring the TCP filters for each TCP/IP port.

The initial state is off and thus by default all TCP/IP packets are accepted.

How it works

TCP/IP Filters may be defined for individual ports on the server or as server-wide filters that apply to "All ports" on the server machine. When a packet comes in, the software first checks to see if there is a filter that applies to that particular port. If more than one filter has been defined for that port, it will then check the IP address field, and use the filter that most closely matches the sender's IP address.

If no filter exists for that specific port, then it will look for the "All Ports" filters, and again, apply the one that most closely matches the sender's IP address.

TCP Filtering is installed on the server machine in the "off" or disabled state which means that there are no restrictions on incoming TCP/IP packets after installation. The administrator must enable TCP Filtering and restart the server before any filters can be operational; he should at this time also choose the Default filter state. The Default filter may be set to "Deny All" clients not specifically allowed by another filter or "Allow All" clients if not specifically denied by another filter. The initial state of the Default filter is "Deny All". After enabling TCP Filtering, the Default filter state should be either changed to "allow all", or supplemented by adding new filters.

Figure 2, TCP Filter List

To create a TCP filter, the administrator sets three values:

- Services or Port Numbers
- IP addresses
- Access type (deny or allow)

Services or Port numbers

When adding TCP filters, you may choose a service or a well-known TCP port number from the Port pop-up menu or you may type in any valid port number for which to define filters (port number only; no text). In addition, you may choose the "All ports" designation from the Port pop-up menu to apply the filter to all services running on the server system.

These are the ports that map to services offered by AppleShare IP 6.x:

Figure 3, All Ports pop-up menu

IP Addresses

Filters specify an IP address or range of IP addresses from which to control access to services running on the server system. An IP address consists of 4 decimal numbers (ranging from 0 to 255) that are separated by the period character (.). When creating a filter, an IP address may contain wildcard characters (*) that indicate that any number in that location is considered valid. Wildcard characters can not precede any numerical value in the filter, and must always be followed by other wildcard characters, or terminated. For example:

- 17.202.121.140 is a legal filter value, it specifies one particular machine at this IP address.
- 17.22*.***.*** is a legal filter value; it would specify any IP address with first two octets of 17.22x, where x could be any value between 0 and 9.
- 17.2*2.121.*** is an illegal value because of the second octet; wildcards cannot be followed by more numeric characters.
- ***.202.121.140 is also an illegal value, since the wildcards in the first octet are followed by numeric characters in the remaining octets.

Three wildcard characters are always assumed. If the administrator has specified only one or two wildcard characters for an individual byte of the address, the user interface will expand the wildcard character(s) to three. The following is the appropriate wildcard interpretation within individual bytes:

Use of wildcard within byte	Example of use	Could represent any value from:
*	192.1.1.*	0-255

**	192.1.1.**	0-255
***	192.1.1.***	0-255
0**	192.1.1.0**	0-99
0*	192.1.1.0*	0-9
1**	192.1.1.1**	100-199
1*	192.1.1.1*	10-19
2**	192.1.1.2**	200-255
2*	192.1.1.2*	20-29
3*	192.1.1.3*	30-39
4*	192.1.1.4*	40-49

Access Type

Filters may Allow or Deny access to ports on your servers. The initial Default of the TCP Filter is that all incoming packets are denied so you must add Allow filters after enabling filtering, to provide client access to your server.

Filter Interpretation

Filters that pertain to a specific port take precedence over filters that pertain to "all ports." And when more than one filter applies, the one that has a value in the IP address field that most closely matches the sender's IP address will be used.

The interpretation of the filters is not order dependent; in fact, the filters are sorted in order by port, with "All Ports" appearing first, and other specific port numbers listed numerically.

The following examples will clarify how filters are interpreted.

Example 1: In this case, the administrator wishes to restrict access to the local LANs, but they do want to open mail service to everyone except one particular site, which is a known spammer. He might set up his filters like this:

Figure 4, Filter set-up for Example 1

- The first filter denies all clients access to everything (but remember, the interpretation of filters is NOT order-dependent, as it may be in third-party Web Server applications, such as WebStar. Another, more specific, filter would override this one).
- The second filter allows clients on net 17.221.041 access to everything; because it specifically lists the IP address, this filter would take precedence over the first filter for clients from net 17.221.041, who would be allowed access to all services.
- The third filter allows mail servers access. Because it specifically mentions port 25, this filter would override the restrictions to all ports, set up in Filter 1.
- Because filter 3 specifically allows everyone access to port 25, another filter must be set up to deny access to a particular network. If a mail server from network 1.2.3.0 attempts to connect to port 25, Filter 4 will take precedence over filter 3 because it is more specific, in actually identifying the IP address of the client.

Example 2: The administrator wishes to allow everyone access to everything, but wants to limit access to the IMAP Admin Access port to his own computer.

Figure 5, Filter set-up for Example 2

- Filter 1 opens up access to everyone.
- Filter 2 will override filter 1 when it comes to port 626, because filters that specifically name ports are given precedence over the "all ports" filters.
- Filter 3 will take precedence over Filter 2 when a connection is made from a client at 17.221.41.2, because it is more specific in listing the IP address of the client.

Creating, Editing, Duplicating, and Deleting Filters

The icons on the toolbar can be used to create, edit, duplicate, and delete filters, respectively:

Figure 6, Filter toolbar icons: New, Edit, Duplicate, Delete

To add or edit a filter,

- Click the appropriate button from the toolbar to open the TCP Filter editor dialog. (If editing, select the filter you wish to change first.)

Figure 7, TCP Filter dialog box

- Select 'All Ports' or one of the well-known ports from a pop-up menu to which the filter will apply. If the port number is not available in the pop-up menu then enter the number for the desired port but no associated text is allowed (manually-entered ports do not get added to the selection in the popup menu).
- Enter the IP address (use wildcards if desired) of the clients to which you want to allow or deny access. All asterisks (***.***.***.***) would mean "everyone."
- Select access mode: allow or deny.

When you select "Save" then the filter is added to the list for this port. Selecting "Cancel" will discard this entry or any modification to an existing filter.

To duplicate a filter, select it and click the "duplicate" icon in the toolbar; then edit as needed.

To delete a filter, select it and click the trash can icon in the toolbar.

"Find..."

The TCP/IP Filter Admin also lets you do DNS lookups (Find IP Address).

Figure 8, Find IP Address dialog box

The administrator may specify a host name for which it wants to look up the associated IP address. The resulting IP address may then be used by the administrator to create a filter. If the administrator knows how the subnets are partitioned for a given network, she can replace the appropriate lower bytes of the returned IP address with wildcards, thus creating a filter that would apply to everyone at the site (i.e., on that network).

For example, if the IP address returned for "marvin.apple.com" is 17.104.104.86, and the server administrator knows that they are using subnet mask 255.255.255.0, then a filter can be created for IP address 17.104.104.***, thus applying not only to marvin.apple.com, but every other client on that network as well.

Troubleshooting Tips

Here are some suggestions for troubleshooting issues with TCP Filtering:

- Verify that the ASIP server running TCP Filtering has at least Mac OS 8.5 and Open Transport 2.0 installed.
- If clients are having issues accessing a particular service:
    - Verify that the service is enabled in ASIP Manager.

    - If TCP Filtering is enabled, check the Filter List for a filter that may be preventing access; look first at the filters that apply to the port the client is trying to access; check the range of IP addresses allowed or denied by that filter and compare it to client's IP address; if no filter for that particular port exists, then the "all ports" filter(s) would apply.
    - If confused by the combination of filters, try disabling TCP Filtering altogether, stop and restart the server and see if access is then successful. If not, then the issue is not with TCP Filtering. Remember that other firewalls implemented at the server's end, or at the end user's network, may prevent access to services also.
- If clients can access services when they should be denied:
    - Verify that TCP Filtering is enabled.
    - Verify that the filtering scheme is set up to deny access: check the filter for the specific port first, then look for the filter that has a value in the IP address field that would apply to the client in question.
    - Remember that changes in the Filtering will take affect immediately, but do not apply to active connections. The client must disconnect from the server, and test reconnecting again.
- Verify that the service is being offered on the port specified in the Filter. Some applications, such as the Mail Server Admin program or the ASIP Advanced Setup Utility, allow you to change the port numbers, so they will no longer match the predefined popup list in the TCP Admin program. A utility such as MacTCP Watcher has an option to "Show Connection List"; this will list the ports that the server is listening on.

AppleShare IP 5.x, 6.x: First Aid Tool

AppleShare IP First Aid Tool is a utility being shipped for the first time to assist server administrators in verifying, reconstructing, and backing up the key files used for maintaining access privileges on the AppleShare IP (ASIP) 6.1 server: the Users & Groups data file, and the volumes' PDS files.

The ASIP First Aid tool is supported only on ASIP 5.x and 6.x servers.

This article covers the following topics:

- When to use AppleShare IP First Aid Tool
- How to use AppleShare IP First Aid Tool

This article has been archived and is no longer updated by Apple.

When to use the AppleShare IP First Aid Tool

You can use the AppleShare IP Tool on the following occasions to keep your server functioning properly. Remember that not all file corruption can be corrected with the tool.

- Use the ASIP First Aid tool to periodically back up your Users & Groups data file and PDS files. In addition to performing this task as part of routine server maintenance, it would be especially wise as a precaution before upgrading the server's OS or installing new hardware, or as a way of retaining access privileges when doing a clean install (after the clean install, restore the files).
- Whenever you have unexplained problems at the server, such as freezing or trouble with clients connecting, verify the state of the Users & Groups data file and PDS files. Corruption in either of these files can cause problems accessing the server.
- If the time it takes for the server to start up is very long, or the server simply never finishes starting up, verify the Users & Groups and PDS files; corruption in these files can cause problems when the server is checking the integrity of server information at start up.

How to use the AppleShare IP First Aid Tool

Verifying, reconstructing, and backing up

- Restart the ASIP 6.1 server with extensions off. Before attempting to use the ASIP First Aid Tool, quit all open applications and restart the server with the shift key down to turn off extensions. This keeps other applications from using the Users & Groups Data file; when this file is busy, the ASIP First Aid Tool cannot work on it.
- Launch the ASIP First Aid Tool.

Figure 1, ASIP First Aid Tool

- Back up your files first, by selecting the "Backup..." button and selecting the volume whose information you want to backup (backup each volume separately). This is a wise precaution, especially before you attempt a reconstruction. The data from the Users & Groups data file and the access privileges for that volume will be preserved in a file on your hard drive, that can then be used to restore the data at a later date.

Figure 2, FirstAidTool Backup icon

- Verify the PDS files. Each read/write volume on your desktop will have a PDS file, containing information about which folders are sharepoint, and what the access privileges are. After selecting the "Verify PDS" button, you'll be asked to select the volume you want to check. Verify each volume in turn. Reconstruct if problems are found, as indicated in the report below.

Figure 3, ASIP First Aid report

- Verify the Users & Groups Data file. Again, you'll be prompted to select which file to verify; be sure to select the file that is in the current startup disk's System Folder:Preferences folder.

Making PDS files visible.

The ASIP First Aid utility also allows you to make PDS visible or invisible. Select the option you want from the Utilities menu, then select the appropriate volume. (The AppleShare PDS file, normally invisible, is located at the root level of each local read/write volume on the server's desktop.) By making it visible, you can manually back up the file to a floppy or some other volume. It is not essential that the file be made invisible again, but by doing so, you prevent the file from being inadvertently renamed or moved, which would cause a loss of privileges on the server.

AppleShare IP 6.1: Installation Notes

AppleShare IP 6.1 ships with a Mac OS 8.5 CD. Detailed steps on how to install both the operating system and AppleShare IP (ASIP) can be found in the "Getting Started with Mac OS 8.5 Server" manual that shipped with the software. A text file entitled "ASIP 6.1 Upgrade Instructions" can also be found on the CD, with information for users who are upgrading from a previous version of ASIP. For seasoned administrators and technical support engineers, outlined below are the steps involved for:

- Upgrading. Installing over a previous version of AppleShare or AppleShare IP.
- Upgrading with Clean Install: Upgrading a previous version of AppleShare, but doing a clean install of the OS at the same time.
- New Install. Installing Appleshare IP on a machine for the first time.

This article has been archived and is no longer updated by Apple.

Upgrading

When ASIP 6.1 is being installed over a previous version of ASIP (not doing a clean installation).

- Back Up. Before starting any upgrade procedure, whether it be hardware or software, it's a good idea to have a backup of all server data. This allows you to get the server back up and running in the shortest possible time, in the event of an unforeseen situation, such as a power outage during the installation procedure.
    - Back up essential ASIP files (Users & Groups Data file and the invisible PDS file on each server volume). To back up the invisible PDS files, you'll need to use a utility such as ResEdit or Norton Disk Editor to first make the files visible. Then drag them to a floppy or another volume, keeping track of which volume each PDS file came from, so you can restore it to the proper location, should you need to. Backing up these files is just a precaution.). Note that the ASIP First Aid Utility facilitates the process of backing up these files on your 5.x or 6.x server.
    - Verify that you have a recent back up of all server data. At a minimum, you can back up the existing System Folder to another volume as a precaution before proceeding (in addition to backing up the ASIP files, as described above).
    - If you are installing on a mail server, make sure you have a backup of the mail database.
- Install Mac OS 8.5, if desired. The minimum version of Mac OS that can be used with ASIP is 8.1, but installing 8.5 is required to use the TCP Filtering feature. The OS installation process also runs Disk First Aid on the Startup Disk and updates hard disk drivers as necessary. It would also be wise at this time to run Disk First Aid on all other server volumes, and rebuild desktop files, before putting the server back on line.
- Install ASIP 6.1. Select easy install to install everything, or custom install to select a subset of server components, as you prefer.
- Restart and run Easy Setup. Your serial number should still be available from the old preference files, and you should be ready to go. If you are running a version of the mail database that is earlier than 6.0, you must use the ASIP Mail Tool to update the database.

Upgrading with Clean Installation

This process creates a new System Folder, and should be used whenever the integrity of the existing System Folder is in question.

- Back up before starting any upgrade procedure, whether it be hardware or software. It is a good idea to have a backup of all server data. This allows you to get the server back up and running in the shortest possible time, in the event of an unforeseen situation, such as a power outage during the installation procedure.
    - Back up essential ASIP files (Users & Groups Data file and the invisible PDS file on each server volume). To back up the invisible PDS files, you'll need to use a utility such as ResEdit or Norton Disk Editor to first make the files visible. Then drag them to a floppy or another volume, keeping track of which volume each PDS file came from, so you can restore it to the proper location, should you need to. Backing up these files is just a precaution.). Note that the ASIP First Aid Utility facilitates the process of backing up these files on your ASIP 5.x or 6.x server.
    - Verify that you have a recent back up of all server data. At a minimum, you can back up the existing System Folder to another volume as a precaution before proceeding (in addition to backing up the ASIP files, as described above).
    - If you are installing on a mail server, make sure you have a backup of the mail database.
- Install Mac OS 8.5, if desired, choosing the "Clean Install" option. Mac OS 8.1 could also be installed, but 8.5 is required for TCP Filtering. The OS installation process will also run Disk First Aid on the Startup Disk and update hard disk drivers as necessary. It would also be wise at this time to run Disk First Aid on all other server volumes, and rebuild desktop files, before putting the server back on line.
- Configure control panels:
    - Date & Time: Remember to set the time zone, also.
    - Energy Saver: Use Server Settings to prevent the server from sleeping. You can also set it to restart after a power outage.
    - AppleTalk: Select appropriate interface for AppleTalk communications.
    - TCP/IP: Configure the TCP/IP control panel with a static IP address, subnet mask, router address, DNS servers.
- Install ASIP 6.1 Select easy install to install everything or custom install, to select a subset of server components, as you prefer. Restart the server after the installation is complete, but don't launch the ASIP applications yet.
- Restore ASIP files. If you used the ASIP First Aid utility to backup the files, use the same utility to restore them to their correct locations. If you backed up the files manually, follow these steps to restore:
    - Drag the new Users & Groups Data file from the Preferences folder to the desktop.
    - Drag your backup of the Users & Groups data file (from Previous System Folder) to the Preferences folder.

        - The AppleShare PDS files from your server volumes do not need to be restored at this point, because they did not get altered by the clean installation process UNLESS you didn't follow these instructions and opened a Web & File program before restoring the Users & Groups data file. If you did so, your PDS files would have been set back to default; you will know when this happened because all privileges of the folders are lost. If this should happen, you can quit any open ASIP applications and restore the AppleShare PDS files to the volumes they came from at this time. The files do not need to be invisible, but making them so prevents them from being inadvertently moved or renamed.
    - Restart the server.
- Run Easy Setup.

New Install

This process should be followed when setting up a server for the first time.

- Install Mac OS 8.5, if needed/desired. ASIP 6.1 will work with Mac OS version 8.1, except for TCP Filtering which requires Open Transport 2.0, a part of Mac OS 8.5. If a System Folder already exists on the machine, it is advisable to select the option to do a clean install. This process will also run Disk First Aid on the startup disk, and update the hard disk drivers if needed. It would also be wise at this time to run Disk First Aid and update drivers on all other server volumes, and rebuild desktop files, before putting the server on line.
- Configure control panels if needed:
    - Date & Time: Remember to set the time zone, also.
    - Energy Saver: Use Server Settings to prevent the server from sleeping. You can also set it to restart after a power outage.
    - AppleTalk: Select appropriate interface for AppleTalk communications.
    - TCP/IP: Configure the TCP/IP control panel with a static IP address, subnet mask, router address, DNS servers.
    - File Sharing: Enter owner name (which will become server administrator's account name), password (admin password), and server name.
- Install ASIP 6.1:
    - The ASIP 6.1 installer will detect if Open Doc (needed for the Administrator applications) is present, and install it, if needed.
- Run ASIP Easy Setup, following the prompts (have your serial number handy).

AppleShare IP First Aid 6.2: Read Me

This article comprises the Read Me for AppleShare IP First Aid version 6.2. This software was released by Apple on 21 May 1999 and is available for downloading from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Description
AppleShare IP First Aid is a repair and backup utility for AppleShare data files. It can check the integrity of these files as well as make attempts to repair files that may have become corrupted. It also simplifies the task of making backup copies of these files. Version 6.2 of this software is included with AppleShare IP 6.2 and can repair corrupted files on AppleShare IP 6.0, 6.1, and 6.2 regardless of what language of the Mac OS is being used.

Requires
Mac OS 7.6 is required. Mac OS 8.5.x or 8.6 is recommended
This article has been archived and is no longer updated by Apple.
Contents

- About AppleShare IP First Aid

- Known Problems

About AppleShare IP First Aid

AppleShare IP First Aid is a repair and backup utility for AppleShare data files. It can check the integrity of these files as well as make attempts to repair files that may have become corrupted. It also simplifies the task of making backup copies of these files.

AppleShare uses two kinds of files, the Users & Groups Data File and the AppleShare PDS, during the course of its operation. The Users & Groups Data File, located in the Preferences folder in the current System Folder contains information about the users that can connect to the system and some configurable server settings, while the AppleShare PDS, an invisible file on the root of each volume, contains information about the access privileges and sharing status of each folder on the hard disk. Although normally these files don't require any special maintenance, unexpected events (such as a power outage) can sometimes cause damage to these files. The AppleShare PDS file and the Users & Groups Data File for a computer are connected -- the privileges in the AppleShare PDS file refer to users and groups contained in the Users & Groups Data File.

The user (typically the AppleShare Server Administrator) can Verify the files, which will indicate possible problems and if there is a need for repair. The files can then be Reconstructed, a process which extracts all remaining valid data and places it in a new file. The original, corrupted file is renamed Old Users & Groups or Old AppleShare PDS, and is made visible (if necessary), and the new file is put in the proper place to allow the server to continue functioning.

The user can also Backup and Restore these files simply by selecting the volume to backup, and a location to place the backup. Restoration of a backup is easy, simply select the backup folder and AppleShare IP First Aid determines from which volume the backup came. It is a good idea to make a backup before using Reconstruction.

Requirements for Running AppleShare IP First Aid 6.2

Macintosh computers running AppleShare IP Server 6 or 5

Important: AppleShare IP First Aid does not work with Macintosh File Sharing. Use AppleShare IP First Aid only on computers on which AppleShare IP is installed.

- System Software: System 7.6 is required. Mac OS 8.5 is recommended (with AppleShare IP 6.1)

Using AppleShare IP First Aid 6.2

1. Restart your Macintosh with Extensions off so AppleShare IP First Aid has exclusive access to files.
2. Double-click on the AppleShare IP First Aid application.

Known Problems

- You can't back up a volume more than once to a given folder.

- Not all damaged files can be repaired successfully.
- Sometimes PDS files are reported as damaged when they are perfectly fine - do not take reports of a problem as confirmation that there is a problem, but rather, take them as an indication that there may be a problem.

Mac OS X Server: The Inspector

This article provides information on what the Inspector is, and how it is used in Mac OS X Server.
This article has been archived and is no longer updated by Apple.
A very useful tool in the Workspace Manager is the Inspector. It is similar to the Get Info feature of the traditional Mac OS. It provides information about an item's attributes, contents, tools that it can be used with, and access privileges.

There are several ways to open the Inspector. It can be opened by choosing the Inspector from the Tools menu, by clicking the Inspector button of the Tool Bar, or by keyboard shortcuts.

The Attributes Pane (Command+1)

The Attributes pane provides essential information. It shows if an item is a link and what it is linked to. This is the only way to determine this information.

It also displays the user and the group that the item belongs to. If the item is a directory, the size can be calculated by clicking on the button that has a folder on it. The modification date is displayed in the lower right-hand corner of the window.

The bottom of this pane lists the read and write access permissions for the selected item.

The Content Pane (Command+2)

The Content pane looks different depending on what the selected item is.

If the item selected is a directory or application wrapper then the Contents pane displays a "Sort by:" option. This sorting method is applied inside the wrapper or directory. Wrappers are special kinds of directories that contain executable files and their resources.

If the item is an application, the pane displays the hardware platform (kind of computer) the application was compiled for. For Mac OS X Server the application must be compiled for the PowerPC platform. (Some developers may include other platform versions) It also displays the button titled *Open Application Wrapper*. This allows you to see the files inside the wrapper.

Also displayed are the extensions that the application can open. In Mac OS X Server, applications recognize which documents they can open based on a file's extension. This method is familiar to DOS and Windows users, but quite foreign to traditional Mac OS users.

The extension usually comprises three characters that come after the period in a filename. For example "picture.tif" has tif as the extension. The Contents pane displays all the extensions that an application can open.

The Tools Pane (Command+3)

The Tools pane is used for setting the default application used to open the item. As discussed above, Mac OS X Server uses extensions to open a file. It is quiet possible that several applications are able to open the same type of file. From the Tools pane you can choose the default application to open the items with a particular extension by clicking the appropriate application's icon.

For directories or applications, the Tools pane has no options.

The Access Pane (Command+4)

The Access pane allows the owner of the selected item to set its access permissions. Permissions are divided into read, write, and execute. The ability to read, write, or execute is based on being the owner, a member of a group, or other.

If read, write, and execute are checked only for the owner, then only the owner is able to perform those actions on the item.

If other has execute, read, and write permissions then all users will be able to do all three to the file. This could be a security hole.

Also in this pane is a checkbox that applies the permissions for a directory to all items located inside that directory. This is useful for quickly ensuring that access permissions are set correctly through out an entire directory.

Mac OS X Server: What Is FTP?

FTP (File Transfer Protocol) is a way for computers to transfer files over an IP network. In Mac OS X Server, FTP is started from the command line. This article provides the basic information needed to use the ftp program as a client on Mac OS X Server.

FTP has many options that are not described in this article. For a detailed description of other FTP features open the Terminal application and type "`man ftp`" at the command prompt. This brings up the manual pages for FTP which describe it in detail.
This article has been archived and is no longer updated by Apple.

Remote and Local Computers

First, a few terms need to be defined so that the information below is more clear. The computer that you are connecting to is the remote computer. It is also called a server. A local computer or client, is the computer that you are sitting in front of when connecting to a remote computer.

Using FTP

To start an FTP session, open `/System/Administration/Terminal.app`. This program allows you to access the command line interface that is built into Mac OS X Server. When Terminal.app is opened, a new window and a prompt appears. This is often called the command prompt, or command line because it is where you type in your commands. At the end of the prompt you see by default a % (percent) sign. Commands typed on the keyboard will appear to the right of the % prompt and will be executed when you press the Return (Enter) key.

At the command prompt, type "`ftp [hostname]`" and press return where [hostname] is name of the remote computer. For example:

```
ftp skye
ftp skye.apple.com
ftp 192.168.1.1
```

If a connection can be made to the remote computer you will be asked to provide a user name an password. If you do not have an account on the remote computer an FTP session may not be allowed.

Some FTP sites are set up for anonymous FTP. This is done by many companies and individuals to provide access to public files or updates. These sites are called anonymous FTP sites because the user name to connect to these sites is literally "anonymous". The password is usually your email address. If anonymous FTP is allowed it usually is stated in the message that appears when a connection is made.

After a successful login the command prompt changes to "ftp>". Most of the standard Unix-compatible command line commands can be used in FTP.

The most commonly used commands are "`get`" and "`put`". Any files that are on the remote computer are downloaded to the local computer using the "`get`" command. Files that are transferred from the local computer to the remote computers are uploaded using the "`put`" command.

For example, the command "`get text`" would download the file "`text`" to the local computer. "`Put text`" would upload the file "`text`" to the remote computer.

To get a list of all the commands that FTP accepts, type "`help`" at the "ftp>" prompt. This lists all the available commands.

Transfer Modes

If you are going to upload or download a binary file (an application, compressed file, or anything that is more than a plain text file), FTP must be put in binary mode before the file transfer occurs. This is done by typing "`binary`" at the command line. This is the default mode for Mac OS X Server's FTP program.

To switch to the ASCII transfer mode so that plain text files can be downloaded type "`ascii`" at the command line. If the incorrect transfer mode is used the file probably is not transferred correctly.

Exiting FTP

To terminate an FTP session, type "`exit`" at the "ftp>" prompt. The connection to the remote computer is terminated and the normal command prompt returns. This can also be done to exit the FTP session at anytime.

FTP Server On Mac OS X Server

Mac OS X Server comes with an FTP server. The server is off by default, but may have been turned on when the Setup Assistant was run.

To verify this on Mac OS X Server 10.0 or later, connect to the server using the Server Admin application, click on the Sharing option, and check if the FTP icon indicates that the server is running. See the Mac OS X Server Administrator's Guide for more information on configuring FTP

TA26116_Mac_OS_X_Server_What_Is_FTP.pdf

Service on Mac OS X Server 10

On Mac OS X Server 1.x, open `/System/Applications/Preferences.app`. Double-click on the network option, and then click the "Services" tab. Here it is possible to turn on the FTP server, if you have root access.

Published Date: Feb 20, 2012

Mac OS X Server: The System Log

The System Log is a background process that allows messages from different parts of the operating system to be recorded in several ways. These messages are often important in diagnosing problems with the system, but the messages contain other useful information. This document focuses on the syslog.conf file because understanding it is the key to understanding the system log and its functionality.
This article has been archived and is no longer updated by Apple.
The syslogd is the daemon (background process) that facilitates what is done with the message that the system has generated. The file /etc/syslog.conf is the configuration file that syslogd reads when it starts up.

The syslogd is started when the /etc/rc script executes the /etc/startup/0900_SystemLog script. When the syslogd is started it creates a file called /var/run/syslog.pid. This file contains the process id of the syslogd so that it can be stopped. The syslogd can be stopped and restarted so that a new syslog.conf can be read by the syslogd without restarting the entire computer. The syslogd must be restarted for the changes in syslogd.conf to take effect.

Restarting the syslogd can be done by executing the /etc/startup/0900_System Log script, or by typing syslogd at the command line. **Note**: this must be done as root.

syslog.conf

The syslog.conf file is the configuration file for the syslog. It has only a few operands, but it is highly configurable. The syslog.conf file is divided into two fields, the selector field and the action field. These are usually separated by two tabs.

Selector Field	Action Field
facility.levels	action

The "*" symbol is a wildcard and denotes all facilities or levels.

The Selector Field

The selector field consists of the facility and the level, as shown in the table above. The facility is the part of the operating system reporting the messages, the level is the strength of message. If a message is at or above the level in the selector field, then the action is executed. Actions can do several things with the message and are discussed below.

The possible facilities that can be used are: auth, authprive, cron, daemon, kern, lpr, mail, mark, new, syslog, user, uup, and local0 through local7.

The possible levels are emerg, alert, crit, err, warning, notice, info, debug, and none. The levels are listed from highest to lowest, so a level of debug is the lowest level that can be set and it will report all messages.

Facilities	Levels
auth	alert
authprive	crit
cron	err
daemon	warning
kern	notice
syslog	info
lpr	debug
mail	
mark	
user	
uup	
local0 through local7	

Each facility can be used with any level.

Commas are used to separate multiple facilities from each other. Mulitple selector field on the same line can be separated by a semicolon. All selector fields on the same line have will have the action specified on that line.

Selector Field	Action Field
facility,facility.level;facility.level,level;facility.level	action

All of the messages recorded by the system log would have the same action in this example.

The Action Field

The action field specifies what is done with the message. The following table lists the four possible actions, and what they do.

Message Is	Action
appended to existing file	/var/log/syslog
sent to a host	@[hostname]
sent to a user	user name (commas separate multiple users)
sent to all users	the "*" symbol

Examples

Anything after a "#" symbol on a line is a comment.

kern,lpr.err	root,jim_bob # sends kern and lpr level err and higher to the users root and jim_bob
mail.*;cron.debug	root #sends only to root
mail.alert	* #sends to all users
syslog.err	@records.foo.com #sends to the host records.foo.com

Published Date: Feb 20, 2012

Mac OS X Server: The Installer.app

The installation process in Mac OS X Server centers around the Installer.app located in /System/Administration. The Installer.app installs groups of files called packages. All packages end in the .pkg or .mpkg extensions. A .pkg extension indicates a single package where as a .mpkg extension signifies multiple packages to be installed. Once a package is installed a receipt is created to keep track of the files installed and to remove the package if needed. All receipts are stored in the /Local/Library/Receipts directory.
This article has been archived and is no longer updated by Apple.

Packages

As stated above, a package is a collection of files. One of these is a compressed files that contains the software to be installed. The other files facilitate the installation process. The file contained in a package are:

Package file	What the files does
product.pax.gz	The files to be installed, compressed with gzip and archived with pax (see the man pages for more info)
product.bom	Bill Of Materials: a record of where files are to be installed. This is used in the verification and uninstall processes
product.info	Contains information to be displayed while installing
product.sizes	Text file containing the number of files in the package
product.tiff	Custom icon for the package
product.status	Created during the installation, it will either say installed or compressed
product.location	The location where the package will be installed
software_version	May or may not be present. contains the version of the package to be installed

The contents of a package can be viewed by selecting the package and holding down the command, shift, and "o" key. This opens a new viewer window in which the contents of the package are displayed.

Receipts

The Installer.app creates a receipt after a package has been installed. All receipts are stored in the /Local/Library/Receipts directory. **Note**: all receipts have the .pkg or .mpkg extension so that the Installer.app opens them.

A receipt is very similar to a package. Most of the files explained above are part of the receipt with one major exception: the product.pax.gz file is not contained in the receipt.

The files that make up the receipt allow the Installer.app to remove the package at a later date, or to display the location of the installed files.

The contents of a receipt can be viewed by selecting the receipt and holding down the command, shift, and "o" key. This opens a new viewer window in which the contents of the package are displayed.

The Installer.app

To install a package, open the directory that contains the package and double-click the package to be installed. The Installer.app opens and the "Install" button and the "List" button is active. The Install button starts the install process, while the List button lists the files to be installed and where they are to be placed.

Deleting a package is accomplished by double-clicking on its receipt located in the /Local/Library/Receipts directory. When the Installer is done opening the receipt, the "Delete" button and the "List" button will be active. The "Delete" button removes the files installed by the package and also the package receipt itself.

Also, in the Installer.app window is a pull down menu. This menu has three selections, info, progress, and log. The info option is what the Installer.app shows by default. It shows some basic information about the package or receipt. The progress option shows the user the progress of the operation that is currently taking place (installation, uninstall, or listing). Finally, errors will sometimes be reported during an installation. When this happens the Installer.app will refer the user to the log for a description of the issue.

OpenUp and the Installer

There is a very useful third party program called OpenUp that uncompresses files in Mac OS X Server. This program sometimes tries to open packages or receipts when they are double-clicked. See the following article under the Tools heading for instructions on solving this problem:

Mac OS X Server: Restart After Changing Network Settings

Mac OS X Server requires that you restart the computer after making changes to any of the network settings.
This article has been archived and is no longer updated by Apple.
There may be times when Mac OS X Server does not automatically restart, or prompt you to restart the computer when you make a change. However, **any** time there is a change to the network configuration, the computer must be restarted for the change to take effect.

Mac OS Runtime for Java 2.1: Files Installed

This article identifies the files installed with Mac OS Runtime for Java version 2.1, and their locations.
This article has been archived and is no longer updated by Apple.
In the Extensions folder (inside the System folder)

- MRJ Libraries folder, containing MRJ Lib, MRJ Symantec JITC, the MRJClasses folder and the lib folder.
- MRJ Enabler extension (installed only on computers using Mac OS 8.1 or earlier)
- Text Encoding Converter 1.4.2
- Appearance Extension 1.0.3 (installed only on computers using Mac OS 7.6.1)

In the System folder:

- A Text Encodings folder containing version 1.4.2 of the encodings

In the Control Panels folder (inside the System folder):

- Appearance control panel 1.0.3 (installed only on computers using Mac OS 7.6.1)

In the Preferences folder (inside the System folder):

- Appearance Preferences 1.0.3 (installed only on computers using Mac OS 7.6.1)

In the Apple Extras folder:

- Mac OS Runtime for Java folder

Published Date: Feb 20, 2012

Mac OS Runtime for Java 2.1: Installing on Localized Mac OS

This article identifies some issues with using the North American English installer of Mac OS Runtime for Java (MRJ) on localized versions of the Mac OS.

This article has been archived and is no longer updated by Apple.

The Mac OS Runtime for Java (MRJ) version 2.1 Installer installs the North American English version of the Text Encoding Converter 1.4.2 extension and its associated text encodings. The MRJ 2.1 installer is programmed to replace older versions of these same files. However, on computers running localized versions of the Mac OS, the names of the existing Text Encoding Converter and associated text encodings have been localized as well. On these computers, the North American English MRJ Installer cannot recognize the older files, and does not install the newer Text Encoding software. A localized MRJ 2.1 installer is expected to be available in a future release of the Mac OS.

If your computer is running a localized version of the Mac OS with Text Encoding Converter extension 1.3 or later installed, MRJ 2.1 works but may experience some text handling errors.

If you have an earlier version of the Text Encoding software installed (previous to version 1.3), an alert message appears during installation to indicate that your system software must be updated before MRJ can be installed.

Published Date: Feb 20, 2012

Mac OS Runtime for Java 2.1: Known Issues

This article describes the known issues with Mac OS Runtime for Java 2.1.
This article has been archived and is no longer updated by Apple.
Secure Sockets: MRJ 2.1 does not support the Secure Sockets Layer interface (SSL), which allows applets to access Web pages via "https."

Appearance Manager 1.0: If your system is using Appearance Manager 1.0 (which comes with Mac OS 8), you may see dialog boxes without borders or other visual inconsistencies. You should upgrade to Mac OS 8.1 or later. A free upgrade from 8.0 to 8.1 is available at Apple's Web site: **http://www.apple.com/swupdates**.

Games and modifier keys: Some game applets use the Shift, Alt, and Control keys as game controllers. In some cases, these controls will not work as expected.

Apple Studio Display: If you have an Apple Studio Display (flat-panel monitor) and Mac OS 8.1 or earlier installed, you may see cosmetic inconsistencies in the Monitors & Sound control panel. You should update your Apple Displays software as soon as an update becomes available. To check on its availability, go to **http://www.apple.com/swupdates**.

Yahoo games: Multi-user Yahoo games do not work correctly using Internet Explorer and MRJ 2.1. Apple, Microsoft, and Yahoo are working together to resolve this problem.

Low memory: When Java applications are running out of memory, MRJ may put up a blank window with no information in it and appear to crash. If this occurs, you can sometimes quit by selecting "Quit" from the Apple Menu (there is no Edit menu since Java did not start up properly). If several applications are running at the same time, quit unused applications to free up memory, or increase the amount of virtual memory in the Memory Control panel, and then try the application again. If this problem persists, you may need to add additional physical RAM.

Printing: If you use your browser's Print command to print a Web page that contains an applet, the page will contain a blank area where the applet should be. If available, use the applet's Print menu to print the page.

Mac OS Runtime for Java 2.1: Configuring For Proxy Servers

Mac OS Runtime for Java (MRJ) 2.1 ignores Internet Explorer's HTTP proxy settings when loading applets in a browser window. For users behind a firewall that requires a proxy server, this will result in an inability to load any Java applets from websites outside the firewall. Users will see an "Applet closing" error message in the Internet Explorer status line, and opening the Java Log window will reveal ClassNotFound exceptions.

This condition is only found in MRJ 2.1, which is currently available only as a separate download from Apple's website. It is not found in MRJ 2.0, the version included in Mac OS 8.1 and 8.5.
This article has been archived and is no longer updated by Apple.
Apple plans to make available a revised version of MRJ that will correct this condition. Until the revised version is available, you may have to enter proxy information directly into an MRJ configuration file using the following steps.

Before you begin you will need to know the address and port number of your intranet's HTTP proxy server. If Internet Explorer is already configured, you can find this information in the Proxies panel of the Preferences dialog. Otherwise you can ask your network administrator for this information.

1. Launch SimpleText and choose the "Open..." command from the File menu.

2. In the file dialog, navigate to the active System folder, then the Extensions folder, then the "MRJ Libraries" folder, then the "lib" folder.

3. Choose the "appletviewer.properties" file. It will open in a SimpleText window.

4. Scroll to the end of the file if necessary, and click at the end of the last line to put the insertion point at the very end of the file.

5. Press the Return key a few times, then enter the following three lines:

proxySet=true
proxyHost=NAMEOFYOURPROXYSERVER
proxyPort=80

Press the Return key at the end of each line (including the final line). The spelling and capitalization must be exactly as shown above. Do not put any blank spaces anywhere in these lines. On the second line you **must** replace "NAMEOFYOURPROXYSERVER" with the name of your HTTP proxy server, for example, "proxy.mycompany.com". If the proxy server uses a port other than the default 80, replace the "80" on the third line with the actual port number.

6. If your network also has an FTP proxy server, enter the following
three additional lines:

ftpProxySet=true
ftpProxyHost=NAMEOFYOURFTPPROXY
ftpProxyPort=21

Enter this exactly as shown, just as in step 5, except: On the second line you **must** replace "NAMEOFYOURFTPPROXY" with the name of your FTP proxy server, for example, "ftpproxy.mycompany.com". If the proxy server uses a port other than the default 21, replace the "21" on the third line with the actual port.

7. Save changes to the "appletviewer.properties" file, and quit SimpleText.

8. Quit Internet Explorer if it was running, then launch it again. You should now be able to access Java applets outside the firewall.

Note: Once the "appletviewer.properties" file has been configured for your firewall, you may copy the file onto other computers, replacing the original file in the "lib" folder. This is a lot easier and more reliable than hand-editing the file on each computer.
Published Date: Feb 20, 2012

Mac OS X Server: About bootp and NetBoot

Learn about the bootstrap protocol (bootp) and how it relates to NetBoot.
This article has been archived and is no longer updated by Apple.
Bootp is the bootstrap protocol. It can be used to transfer an IP configuration image to a client; in addition it can also transfer an operating system image to run diskless clients. These are two separate steps so that a client can get an IP address without having to boot from the server. This is the basically the same procedure as NetBooting.

When a client makes a bootp request, it broadcasts its Ethernet address. This is the address for the computer's network interface card(s). Specifically, it is referred to as a MAC (Media Access Control) address. The network interface may be built into the logic board, or it may come from a card that has been added to the computer. A bootp server recognizes a client via its Ethernet address. The server will ignore all bootp broadcasts that come from Ethernet addresses that are not in its configuration table.

If a bootp server is in the same subnet as the client making the request the server will return the IP configuration of the client. It will also return the name and location of the file used to boot diskless clients. Note: bootp packets do not travel across subnets, but some routers have the extensions to allow this, check with the router manufacturer. In normal operation it is not a good idea to allow bootp packets to cross subnets.

If the client is going to boot from its hard drive, bootp will quit and the normal boot sequence will continue. However, if the client is going to boot from the server it will need to download the operating system image file. This is done by bootp and TFTP (trivial file transfer protocol). TFTP is a simple version of FTP that operates via UDP instead of TCP. UDP is a much lower level process than TCP and requires fewer resources to operate.

The bootp client will pass the location of the bootfile image to the TFTP client. The TFTP client will then request that the image be downloaded from the server. Once the image has been downloaded, bootp will load the image into memory (including virtual memory) and booting will continue.

Bootp Daemons

Two daemons should be running on a bootp server. These are bootpd and bootparamd. The easiest way to confirm this is to open the ProcessViewer and visually inspect that both the processes are running. Another way is to type "`ps -aux | grep bootp`" at the command line. This searches the currently running processes for these processes. This command will also show the user that the owner of these processes is root.

Both the bootpd and bootparamd must be running for bootp and NetBooting services to work properly.

NetInfo Bootp Properties

If a Netinfo server is also a bootp server the configuration information for the clients will have to be in NetInfo, so that bootp can do its job. There are five properties that must be present in the NetInfo database. The table below shows these properties and theoretical values associated with them.

Here is a table of the five properties and their values:

name	Skye
bootfile	mach
ip_address	192.168.1.1
en_address	0:5:b:3b:f6:7
bootparams	root=scotland:/bootimages/MXS private=scotland:/bootimages/MXS/private

These properties and values tell the server which IP configuration to assign to a client based on its MAC address. The en_address is the MAC address and is used for identification of authorized clients. The name and ip_address properties are assigned to the client, thus configuring it for TCP/IP network access.

The server also returns the values for bootfile and bootparams. The bootfile is the file that contains the operating system the client will boot from. The bootparams property is the location of the operating system image. The client will only use these values if it is booting from the server.

NetBoot uses a modified version of bootp. For information about the NetBooting implementation of bootp, please see the following article:

Article 60080 "**Mac OS X Server: NetBoot Theory Of Operation**."

Macintosh G3 Server (Blue and White): Selecting Ethernet Ports

If you purchased a Macintosh Server G3 With Mac OS X Server, the server computer includes a 4-port Ethernet card that may be labeled incorrectly.

This article has been archived and is no longer updated by Apple.

In "Connecting to an Ethernet Network" of Setting Up Your Macintosh Server G3, an illustration shows the four ports of the Ethernet card numbered 1 to 4 from left to right. However, the ports are numbered from right to left. Therefore, in Mac OS X Server's Setup Assistant or Network settings panel, Ethernet port 1 corresponds to the port on the right while Ethernet port 4 corresponds to the port on the left.

Mac OS X Server: Making Sure the Hard Disk Is Working Properly

How can I check to see if the hard disk is working properly in my Mac OS X Server computer?
This article has been archived and is no longer updated by Apple.
You use the fsck command to repair corrupted or damaged hard disks in Mac OS X Server format.

You use Disk First Aid to verify and repair a hard disk in Mac OS Extended format. The volumes you use to store NetBoot users' documents use Mac OS Extended format.

Note: Some volumes can be verified but not repaired, such as the volume the Disk First Aid application is stored on, a write-protected disk, or a disk that has open files. On your NetBoot server, the Disk First Aid application is located on a volume formatted in Mac OS X Server, and Disk First Aid does not verify or repair this type of volume.

To verify or repair a hard disk:

1. Log in to the server as the Administrator ("root").
2. Open the Server Administration menu (in the Apple menu) and choose Disk First Aid.
3. Click the volume you want to verify or repair, then click Verify or Repair. You verify a hard disk first. If problems are found, then you can repair the disk. You can select more than one volume by pressing the Shift key while clicking a volume.

Published Date: Feb 19, 2012

Mac OS X Server: Creating a QuickTime Server Firewall

I am firewalling a QuickTime server with Cisco access control lists. What rules do I need beyond:

```
!inbound
access-list 101 permit tcp any host qtserver eq 554
!outbound
access-list 102 permit tcp host qtserver eq 554 any established
```

This article has been archived and is no longer updated by Apple.

Inbound and outbound UDP for the data traffic. Each track in a movie uses a pair of UDP ports (even/odd number). The RTP traffic flows on the even port, from server to client (no back traffic). RTCP traffic flows on the odd port, both ways. QuickTime uses ports 6970 and up on the client side, servers vary widely. Opening, say, 30 ports here should allow any client to view several movies and not run out.

Published Date: Feb 19, 2012

Mac OS X Server: Power Macintosh G3 (Blue and White) Won‘t Start up With Mac OS 8.x

A Power Macintosh G3 (Blue and White) will not start up with Mac OS 8.x when holding down the option key.
This article has been archived and is no longer updated by Apple.
This is a result of the New World ROM architecture on these computers. When trying to start up from the default operating system, it will scan drives and partitions until it finds a suitable one. If it comes across the MOSX_OF3_Booter partition first, it will start up with Mac OS X Server instead of Mac OS 8.x.

The MOSX_OF3_Booter partition is a hidden Mac OS format partition that contains a blessed System Folder with a Finder, System, and BootX file. The BootX file is analogous to the Mac OS ROM files used in Mac OS and is needed to start up Mac OS X Server.

Solution
Make sure Mac OS 8.5 or later is installed on the first partition on the drive.
Published Date: Feb 19, 2012

Mac OS X Server: USB Keyboard and Restart/Shut Down Window

Under Mac OS X Server, users can restart or shut down the Mac OS X Server by pressing the Control and Power keys to bring up the Restart/Shutdown mini-monitor window. Users are presented with the following message:

> Restart or shutdown?
>
> Type R to restart, or H to shutdown.
> Type C to continue

For computers with a USB keyboard like the Power Macintosh G3 (Blue and White), the Restart/Shutdown mini-monitor appears, but users are unable to type anything in the window. Users are forced to restart or shutdown the computer manually.

Why does this occur?
This article has been archived and is no longer updated by Apple.
The Restart/Shutdown mini-monitor window occurs at a lower level than the code for the USB driver in Mac OS X Server. As a result, USB input is not recognized in this window.

If you have a computer that has a USB keyboard, you should not use the Restart/Shutdown mini-monitor window. Instead you should restart or shut down the server by logging out of Mac OS X Server and clicking the appropriate button. Additionally, Power Macintosh G3 (Blue and White) users can use an Apple ADB keyboard as this issue does not occur with an Apple ADB keyboard.
Published Date: Feb 19, 2012

Mac OS X Server: ATTO SCSI Cards In Macintosh Server G3 (Blue and White)

The ATTO SCSI cards that shipped with the original Macintosh Server G3 cannot be used under Mac OS X Server with the Macintosh Server G3 (Blue and White).

This article has been archived and is no longer updated by Apple.

ATTO SCSI cards that were included with the Macintosh Server G3 prior to 1999-01 cannot be used in the Macintosh Server G3 (Blue and White). Attempting to use these cards in a Macintosh Server G3 (Blue and White) with Mac OS X Server will result in a SCSI driver initialization failure.

Mac OS X Server: How Darwin OS Differs

What is the difference between Mac OS X Server and Darwin OS?
This article has been archived and is no longer updated by Apple.
Mac OS X Server is a retail product. It is a server operating system with a Macintosh-like Graphical User Interface (GUI).

Darwin OS is the Open Source release of the Mac OS X Server operating system foundation. It does not include source code for the graphical user interface, NetBoot, Macintosh Manager, Apple File Services or WebObjects. Darwin OS is available from Apple at http://www.apple.com/darwin/

Apple does not offer telephone technical support for Darwin OS components.
Published Date: Feb 19, 2012

Mac OS X Server: WebObjects Installation - Overwrite Existing Files?

While installing the following packages from the WebObjects disc, messages will sometimes appear asking if existing files should be overwritten:

- MacOSXServerDeveloper.mpkg
- WebObjectsDeployment.mpkg
- WebObjectsDeveloper.mpkg

This article has been archived and is no longer updated by Apple.
The WebObjectsDeveloper package includes the WebObjectsDeployment and MacOSXServerDeveloper package. This will be the package most developers will want to install because it provides the widest range of options and programming environments. Developers will only need to install the deployment package if they only want to deploy WebObjects applications. The MacOSXServerDeveloper package installs the development tools used to create non WebObjects applications.

In any case, overwriting the existing files will not cause a problem and is the proper action when installing these packages.
Published Date: Feb 19, 2012

Mac OS: Can‘t Start Up Computer From Mac OS Disc

I can't start up the computer using the Mac OS CD. What should I do?
This article has been archived and is no longer updated by Apple.
Cause 1: Your computer located the system software on your hard disk before it located the system software on the CD. If you have an external hard disk with system software, the computer may locate and start up from that device instead of the CD.

Solution 1: With the CD inserted, open the Startup Disk control panel and click the CD icon in the Startup Disk window. Then restart the computer.

After you install the software, use the Startup Disk control panel to reselect your hard disk, then restart your computer.

Cause 2: You don't have an Apple-brand CD-ROM drive, or you're accessing the CD from a PowerBook using file sharing.

Solution 2: To ensure a smooth installation, turn off any disk security or virus-protection software you have installed. Then follow the steps in this section to temporarily disable all non-Apple extensions and control panels so they won't cause problems during installation.

If you are using System 7.5 or later, use the Extensions Manager control panel to turn off non-Apple extensions and control panels. In the Extensions Manager, open the Sets pop-up menu and choose the item that has the word "base" and the version of system software currently installed on your computer. (If you have System 7.5, choose the item that has "system" in it.) Then restart the computer.

If you are using an earlier version of system software, or don't have the Extensions Manager, do the following:

1. Open the System Folder, then open the Extensions folder.
2. Drag any non-Apple extensions out of the Extensions folder and onto the desktop. If you don't know where a particular extension came from, click it once to select it, then open the File menu and choose Get Info. If the Version section of the Info window doesn't say "Apple Computer, Inc.," drag the extension to the desktop.
3. Open the Control Panels folder.
4. Drag any non-Apple control panels out of the Control Panels folder and onto the desktop. As in step 2, use the Get Info command if you're not sure whether to remove a control panel.
5. Restart your computer.

After you've finished installing the software, you can drag the extensions and control panels back to your System Folder. To make sure the software is compatible with this version of the Mac OS, restart your computer after you reinstall each item.
Published Date: Feb 20, 2012

Mac OS 8/9: The Installer Cannot Repair Your Hard Disk

When I try to install Mac OS 8.x or 9.x, I get a message that says the installer was unable to repair a problem with the hard disk. What should I do?
This article has been archived and is no longer updated by Apple.
Solution 1: If you see a message that the disk can't be fixed because a file is open, quit all programs. If file sharing is on, turn it off. Then try installing again.

Solution 2: Use Disk First Aid, provided on the appropriate Mac OS CD, to see if it can repair the disk.

Solution 3: Use a third-party disk repair utility to see if it can repair the disk.

Warning! If you use Norton Utilities, make sure you have version 3.5.2 or later. Earlier versions may damage data on Mac OS Extended format disks.

If you don't have a third-party utility, or if that utility can't repair the disk either, you will need to reinitialize the hard disk.

First, back up your hard disk because reintializing erases everything on the disk. Then use the Drive Setup utility program to reinitialize the disk. If your hard disk is not an Apple hard disk, use the disk utility software provided by the manufacturer instead of Drive Setup.

You can find Drive Setup in the Utilities folder on the appropriate Mac OS CD. To reinitialize your startup disk (the disk with system software on it), you need to start up the computer from the appropriate Mac OS CD. For help with Drive Setup, open the program, then look in the Help menu.

After you've reinitialized the disk, use the appropriate Mac OS Installer to reinstall system software, then reinstall your application programs.
Published Date: Feb 19, 2012

Mac OS: The Installer Cannot Update The Hard Disk Driver

When I try to install Mac OS, I get a message that says the installer could not update the hard disk driver. What should I do?
This article has been archived and is no longer updated by Apple.
Cause 1: You don't have an Apple hard disk.

Solution 1: Use the disk utility recommended by the manufacturer of your hard disk to update the drivers on your system before installing the Mac OS. Make sure to get a version of the utility that is compatible with the software you are installing. An old utility will not be able to update your disk with the most current driver.

Cause 2: You've previously updated your Apple hard disk with a non-Apple disk utility.

Solution 2: You need to use the utility you used previously to update the driver again. To ensure a successful update, obtain the latest version of the utility from the manufacturer.

Cause 3: Your hard disks may need to be reinitialized before you can update the driver.

Solution 3: Reinitializing your hard disk will completely erase the disk. Be sure to back up all the files on the hard disk before proceeding. For instructions on reinitializing the hard disk, see the manual that came with your computer, but use the Drive Setup program provided on the Mac OS CD to perform the initialization, even if a different Apple disk formatting utility was supplied with your computer.
Published Date: Feb 19, 2012

Mac OS: "System File Cannot Be Modified" Message

When I try to install Mac OS, I get a message that says the System file could not be modified. What should I do?
This article has been archived and is no longer updated by Apple.
Cause 1: You have installed virus-protection software that guards against modification of the System file.

Solution 1: Start up your computer from the Mac OS CD.

Solution 2: Drag any virus-protection software out of the System Folder and restart your computer. You can put the virus-protection software back after installation.

Cause 2: The System file or the Finder file may be locked.

Solution 2: To see if your System file or Finder file is locked, select the file's icon. Then open the File menu and choose Get Info. Make sure the Locked checkbox is not selected.
Published Date: Feb 19, 2012

AppleShare IP 6.1: File Save/Open Issue With PowerPoint 97 via SMB

Apple has received reports of a problem saving/opening Microsoft PowerPoint 97 file on an AppleShare IP (ASIP) 6.1 volume via Windows File Sharing (SMB) connections.

When saving a file to an ASIP volume, the file may appear to save properly but contains no slides.

When opening a file on an ASIP volume, the following error may occur:

PowerPoint can't open the type of file represented by <filename>

In both cases, the file rendered unusable.

Note: PowerPoint 97 apparently writes to a file when it is opened, so opening a file without specifically saving may also render it unusable.

This article has been archived and is no longer updated by Apple.
Apple has investigated these reports and has determined that the problem is partially solved by updating PowerPoint 97 with Office 97 Service Release 2 (SR-2). Apple has addressed the remainder of this issue in AppleShare IP 6.2, which can be downloaded from the Apple Software Updates Web site at http://www.apple.com/swupdates/ .

To avoid this issue, please make sure you are running both AppleShare IP 6.2 and PowerPoint 97 SR-2.
Published Date: Feb 20, 2012

Mac OS X Server: Server Computer Will Not Start up Past "Starting name server"

I just set some IP addresses in Mac OS X Server as a test, and now the server computer is displaying a message that says "Starting name resolver" but it won't start up beyond that. What could be wrong?
This article has been archived and is no longer updated by Apple.
Setting the IP address of the built-in Ethernet interface to 0.0.0.0 causes this error. Using this setting on other interfaces such as en1, en2 works OK for testing purposes. However, with this setting, the server computer can't continue to start up. With the "Starting name resolver" message on the screen, do the following steps:

1. Restart the computer. For computers with an Apple Desktop Bus keyboard, press and hold down simultaneously the Control, Command and Power keys. For computers with a Universal Serial Bus keyboard, shutdown the computer by pressing the Power button, then press the Power button again to start up the computer.

2. Force the computer to start up in single-user mode by immediately holding down the "S" key.

3. At the single-user mode prompt "#" type the following commands to perform a root "/" file system check and enable the root "/" write permission for modification:

```
# /sbin/fsck -fy
# /sbin/mount -uw /
```

4. Using a text editor change the built-in Ethernet interface line of the `/etc/iftab` file (the interface table) to the valid IP address and netmask number. For example change this:

```
en0    inet  0.0.0.0   netmask  0.0.0.0  up
```

to something like:

```
en0    inet 192.168.100.2  netmask 255.255.255.0  up
```

5. Quit the editor program, then type the exit command to continue starting up:

```
# exit
```

Cyrillic Language Kit: Keyboard Stickers Don‘t Match the Keyboard

I am using the Cyrillic Language Kit, and I am trying to use the keyboard stickers that come with it. I am following the included keyboard diagram, but there seem to be too many keys on the second row of letters (a, s, d, etc). The label sheet and keyboard diagrams show 12 keys on this row, but my keyboard has 11. The last key on the row is "E" (E with umlaut) in the Russian layout and ")" in the Bulgarian and Ukrainian layouts. Where do I put this sticker?

This article has been archived and is no longer updated by Apple.

If you are using a US keyboard and a Russian, Bulgarian, or Ukrainian keyboard layout, this last sticker goes on the "\\" key, just above the Return key.

If you are using the Cyrillic-QWERTY transliterated keyboard layout, there is no key that corresponds with this character. The "E" (E with umlaut) is produced by the Option-e key combination, and parentheses are produced just as with a standard US keyboard layout. For details, see page A-19 of your Cyrillic Language Kit Installation and User's Guide.

Mac OS X Server: G3 Still Displays "Firmware Update Needed" Message

When starting up a Power Macintosh G3 (Blue and White) from a NetBoot server, a message is displayed stating that the firmware must be updated. The computer has been updated with the latest version from Apple's web site. Why is the message displayed?
This article has been archived and is no longer updated by Apple.
This is a known issue and Apple is looking into why the message is erroneously displayed. The G3 Firmware Update installs version 1.1f4 of the Boot ROM and should be new enough to avoid this message.

This message can be ignored if the Power Macintosh G3 (Blue and White) has been updated. To check the Boot ROM version, start up into Open Firmware by holding down the Command-Option-O-F keys. The Boot ROM and Open Firmware versions will be listed. To continue starting up, type "mac-boot" and press the Return key.
Published Date: Feb 19, 2012

Mac OS X Server: "G3 Firmware Update Needed" Message

When starting up a Power Macintosh G3 (Blue and White) computer from a NetBoot server, a message is displayed stating that the firmware must be updated. What do I do?

This article has been archived and is no longer updated by Apple.

You should update the computer's firmware. The Power Macintosh G3 Firmware Update 1.1 is available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

The Read Me file for this update is available in article 58374: "**Power Macintosh G3 (Blue and White): Firmware Update 1.1: Read Me**"

Published Date: Feb 19, 2012

Mac OS X Server: iMac Firmware Update Needed For NetBoot

When starting up an iMac from a NetBoot server, a message is displayed stating that the firmware must be updated. The iMac has been updated with the latest version from Apple's web site. Why is the message displayed?
This article has been archived and is no longer updated by Apple.
There is a newer version of the iMac firmware included with Mac OS X Server. It is installed as part of the NetBoot Server software and can be found in the "Admin" folder on the Mac OS X Extended format volume the NetBoot software was installed on.

There are two ways to tell the different firmware updates apart. The version of the updater application included with the NetBoot Server is 1.1. The updater application from the web site is version 1.0. Also, the modification date for the "iMac Firmware 3.0" file is December 1998 for the one on the web site and February 1999 for the one installed with the NetBoot Server.
Published Date: Feb 19, 2012

Mac OS X Server: Mac OS Installed From MacOS.app Will Not Startup a Power Macintosh G3 (Blue and White)

In Mac OS X Server, you can install Mac OS from MacOS.app onto a disk partition. The installer creates a System Folder there that will not start up a Power Macintosh G3 (Blue and White).
This article has been archived and is no longer updated by Apple.
MacOS.app requires no Mac OS ROM file because it is not a New World ROM based system, such as the iMac or Power Macintosh G3 (Blue and White). When installing Mac OS from within MacOS.app, the installer places a version of the Mac OS on the drive for MacOS.app and not one for the Power Macintosh G3 (Blue and White). This System folder contains no Mac OS ROM file and will not start up a Power Macintosh G3 (Blue and White) if you select that partition as your startup disk. The installed system will start up Mac OS.app, however.

The workaround is to start up the Power Macintosh G3 Blue and White from the Mac OS 8 or Mac OS 9 CD and install from it.

Mac OS X Server: Selecting a Default AppleTalk Zone Without Routing AppleTalk

This article discusses how to select a default AppleTalk zone without routing AppleTalk.
This article has been archived and is no longer updated by Apple.
Selecting a default AppleTalk zone requires a Terminal window since it must be done from the command line. To select a zone, follow these steps:

1. Stop all processes that may be using AppleTalk. These include MacOS.app, AppleFileServer and MacintoshManagementServer.
2. Open a Terminal window if one is not already open.
3. Type "`appletalk -d`" at the command line and press return.
4. Type "`appletalk -u`" and press return.
5. There should be a list of zones available and a prompt asking for the number of the zone you want to select. Type the number of the zone and press return.

The AppleTalk zone configuration on some networks may cause an error message stating 'message too long' when this procedure is attempted. If that occurs substitute 'appletalk -x' in place of the 'appletalk -u' in step 4.

Mac OS X Server AppleTalk based services will now appear in the selected zone. The default zone is stored in `/etc/appletalk.nvram` file.

These steps are not necessary if routing AppleTalk since the default zone can be selected in Network Preferences.

Mac OS X Server: Computer Stops Responding in "Starting Name Resolver"

This error can occur when the server computer's IP address is mistakenly entered in the Default Router Address field in the Setup Assistant.
This article has been archived and is no longer updated by Apple.
Use the procedure below to correct this condition.

1. Restart your server computer. The cleanest way to do this is to first press Control-and Power, then press the R key.

2. Immediately after you hear the startup chime, press and hold the S key. This will force your server computer to startup into "single-user mode."

3. In single-user mode, you will be presented with a "#" prompt. The line before the # prompt should provide you with instructions for how to mount the root directory with read/write access. You can issue both of these commands on the same line by separating them with a semicolon:

```
# /sbin/fsck -y; /sbin/mount -uw /
```

4. Verify that the default router address is indeed incorrect by issuing the following command:

```
# cat /etc/hostconfig | grep ROUTER
```

It will output a line of the form:

```
ROUTER=192.168.0.23
```

If the value after "`ROUTER=`" is your server computer's IP address instead of the default router address, then this is the cause of your server computer not starting up. Go on to step 5.

5. Now you need to change the `ROUTER` line in `/etc/hostconfig` file. You can do this on the command line, or using a text editor.

Here's the command line method for setting the `ROUTER` line:

```
# mv /etc/hostconfig /etc/hostconfig.broken
# sed 's/ROUTER=.*/ROUTER=192.168.0.1/' /etc/hostconfig.broken >
/etc/hostconfig
```

Of course, replace "`192.168.0.1`" with the actual value for your default router.

To edit `/etc/hostconfig` using a text editor, you will first need to set the `TERM` environment variable.

```
# TERM=nx; export TERM
```

Then invoke pico to edit the `/etc/hostconfig` file:

```
# pico /etc/hostconfig
```

Use Control-N to move the cursor down to the `ROUTER=` line. Then use `Ctrl-F` to move the cursor to the position after the "=". Use Ctrl-D to delete the existing value for ROUTER, then type in the correct value. Finally, press Ctrl-X to exit, press "y" when it asks you if you want to save, and press the Return key to write over the existing `/etc/hostconfig` file.

6. Issue the `exit` command to exit single-user mode and complete starting up. Your server computer will continue starting up and should now get past the Configuring network time message.

Final Cut Pro 1.0: How to Install

Installation places the Final Cut Pro application and its components on your hard disk. Installation of certain software components is determined by the type of capture hardware you will be using with Final Cut Pro. If you have not yet installed and configured the additional hardware you will be using with your computer, read article 60227: "**Final Cut Pro 1.0 Hardware Setup and Configuration**." If you already have a system configured with capture hardware and a camcorder or deck, proceed with the installation instructions in this article.
This article has been archived and is no longer updated by Apple.

1. Insert the Final Cut Pro CD into your CD-ROM drive.
2. Double-click the Install Final Cut Pro icon.
3. Choose a destination disk from the pop-up list and click Select. Note: Final Cut Pro can only be installed on a hard disk with Mac OS 8.5 or later.
4. Read the Software License Agreement and click Continue.
    - Click Agree to continue with the installation.
    - Click Disagree to cancel the installation.
5. Specify the video capture hardware you will be using:
    - Select Truevision Targa Series if you will use a Targa video capture card.
    - Select DV (digital video) if you will use Apple FireWire and DV devices. When you select DV, your default video frame size is set to 720 x 480. **Note**: Selecting DV will install FireWire extensions in your System Folder. These extensions are optimized for Final Cut Pro. If you have existing FireWire extensions in your System Folder that you want to retain, move them out of the Extensions folder before you continue.
    - Select None/Don't Know if you will use hardware other than DV or Truevision Targa.
6. To specify a default video frame size (Truevision only):
    - Select NTSC Standard for a 640 x 480 frame size.
    - Select NTSC (CCIR 601) for a 720 x 486 frame size.
7. To specify the type of video source connection:
    - Select Composite to sample video over a single cable using a BNC or RCA connector.
    - Select S-Video to sample video over a single cable using a 4-pin S-video connector.
    - Select Component to sample video over three cables using Betacam (r-y, b-y, Y) Component BNC or RCA connectors.
8. Click Start to install Final Cut Pro.
9. Restart your computer.
10. Open the Final Cut Pro application and enter your registration information and serial number.

Note: Final Cut Pro is configured to use a standard set of preferences and preset controls based on answers given during installation. You may want to change these before you proceed any further.
Published Date: Feb 20, 2012

Final Cut Pro 1.0: Hardware Setup and Configuration

Final Cut Pro is designed to work with DV and Truevision Targa Series hardware. If you are using DV equipment, use the FireWire cable included with this package to connect your camcorder or deck to your computer. DV devices with FireWire transmit device control data, timecode, video, and audio over a single FireWire cable.

If you are using Truevision Targa equipment, device control and timecode signals are transmitted over one cable while video and audio data use another set of cables depending on the type of video source connection you choose. See your Targa manual for details.

You can also connect camcorders or decks that do not support device control to capture video clips and export edited sequences. To print to video or edit to tape, the card must have video out capabilities. To connect these devices, you need a QuickTime-compatible video capture card. Go to the Final Cut Pro Web site at www.apple.com/finalcutpro for a list of vendors and qualified products.
This article has been archived and is no longer updated by Apple.

Connecting Video Devices to Your Computer

Devices can be connected to your computer through a dedicated video capture card or FireWire connection. It is recommended that you connect and turn on the device before opening Final Cut Pro so the application can detect the device.

If you are connecting devices to your computer with video and audio cables:

- Connect the video and audio cables to the output jacks of your camcorder or deck.
- Connect the other ends of the cables to the corresponding input jacks of your capture hardware.
- Connect an appropriate device control cable between your camcorder or deck and the serial port of your computer.

If you are connecting a DV device to your computer with FireWire:

- Use the 2-meter, 6-pin to 4-pin FireWire cable supplied with Final Cut Pro to connect the device to your computer.
- Plug the 6-pin connector into the computer's FireWire port and the 4-pin connector into the device's DV port. (FireWire ports on external devices are sometimes labeled IEEE 1394 or DV IN/OUT.)

The Apple FireWire port on your Macintosh is a 6-pin port.

Warning! Do not attempt to force the 4-pin connector into the computer's 6-pin FireWire port. 4-pin connectors and ports can be especially fragile. Before connecting a 4-pin connector to its corresponding port, be sure it is aligned properly by matching an indent on the connector to the indent in the port. Do not force the two together.

Both connectors snap into place when properly engaged.

Once you have connected a camcorder or deck to your computer, turn on the device. If you are using a camcorder, switch it to VCR mode (sometimes labeled VTR.) In VCR mode, the camcorder operates as a playback/record deck and uses the video and audio connectors or FireWire for input and output. In Camera mode, the camcorder acquires video and audio through the CCD sensor and built-in Mic, not through the input connectors or FireWire. Final Cut Pro cannot record to the camcorder while it is in Camera mode.

Controlling Video Devices With Your Computer

Final Cut Pro can control devices through a serial or FireWire cable. If your camcorder or deck supports one of the following device control protocols, Final Cut Pro can transmit and receive timecode and transport control data to and from the device. Search mechanisms within some decks can also be controlled by Final Cut Pro.

Note: If your computer does not have a serial port, but does have a USB port, you can use a third-party product such as the Keyspan USB Serial Adapter, which allows you to attach serial devices to the USB port.

The following device protocols are supported:

- Apple FireWire or Apple FireWire Basic
- JVC RS-232
- Panasonic RS-232 or RS-422
- Sony RS-422 or RS-232
- Sony VISCA or LANC

Note: The Panasonic RS-422 and Sony RS-422 protocols require special cables. For more information about the various protocols and their cables, see the Final Cut Pro Read Me file in the Final Cut Pro application folder or visit the Final Cut Pro Web site at http://www.apple.com/finalcutpro

About Apple FireWire
Apple FireWire is designed to work with digital video camcorders and decks that have a FireWire port and use the DV format. With Final Cut Pro and a FireWire connection, you can control external DV devices and capture DV movie clips to your hard disk. You can then view, edit, and apply effects to the DV clips and render movies in the DV format. Final Cut Pro can also play the movies to your camcorder or deck through the FireWire connection where the output can then be recorded on tape.

Apple FireWire Basic
FireWire (IEEE 1394) is a serial bus currently supported by many professional and consumer level camcorders and decks. However, there is a wide range of functionality and adherence to the FireWire specifications among these devices. For this reason, two versions of the FireWire protocol (Apple FireWire and Apple FireWire Basic) are provided in Final Cut Pro's Device Control preferences.

If your deck or camcorder uses FireWire, begin by using the Apple FireWire protocol. This is the default protocol if you selected DV during the installation setup. While all decks and camcorders support the most basic functions like returning timecode and accepting basic transport commands, other commands may not be supported. If you find that the device does not accurately go to specified timecodes or fails to execute special commands, try the Apple FireWire Basic protocol.

To switch between FireWire protocols in Final Cut Pro:

- Choose Preferences from the Edit menu and click the Device Control tab.
- Choose Apple FireWire or Apple FireWire Basic from the Protocol pop-up menu.

System Configurations
A basic configuration includes a computer, a high-resolution monitor, and a video camcorder or deck. Your source footage will be sampled to the internal hard disk of the computer via FireWire or other video/audio connection. Footage can then be edited on the computer with Final Cut Pro and output back to tape through FireWire or other video/audio connection.

A recommended setup also includes an Ultra Wide A/V hard disk drive, an external set of speakers, and an NTSC video monitor.

- An Ultra Wide A/V hard disk drive provides a dedicated, high-throughput storage medium where video and audio can be recorded or rendered. The benefit of using a dedicated drive for your media is that the drive contains no operating system software or other applications and files that can fragment the disk. Fragmentation can interfere with the continuous data flow of video and audio to and from the disk. You can add an internal drive to your existing SCSI bus or you can install an Ultra Wide SCSI card to support an external A/V drive.
- External speakers allow you to hear audio output from your video camcorder or deck. Many camcorders come with a built-in speaker, but external speakers will provide you with higher quality audio output.
  Audio is output through the camcorder or deck
  - when playing back video with audio in the Viewer, Canvas, or Timeline
  - when printing or editing video to tape

  Note: When playing video in the Canvas, audio output through the external speakers will be slightly out of sync with the video. Audio from the external speakers will, however, be in sync with video displayed on an NTSC monitor.
- An NTSC monitor is highly recommended for previewing video output from your hard disk if you intend to output to videotape or broadcast on television. Final Cut Pro outputs video to the NTSC monitor through the camcorder or deck. Many video camcorders have built-in LCD displays that can also be used for this purpose. An NTSC monitor can also be used to view the playback from your video device when you are searching for edit points. Connect the NTSC monitor to your video deck or camcorder using the Component, S-Video, or Composite output jacks.

Ultra Wide SCSI Hard Disk Drive and PCI Card Specifications
Digital video and audio demands high data throughput to and from the hard disk drive. For the best performance when working with digital media, use a high-capacity, Ultra Wide SCSI drive. Depending on your system configuration, you may be able to add an internal drive if you have an existing Ultra Wide SCSI bus. If you do not have an internal Ultra Wide SCSI bus, install an Ultra Wide SCSI card in one of your computer's PCI slots. Refer to the Final Cut Pro Web site at http://www.apple.com/finalcutpro for a list of vendors and qualified products.

About the Internal Ultra Wide SCSI Bus
If your computer came with an Ultra Wide SCSI card, all devices on the same SCSI bus must have unique ID numbers. However, devices on different SCSI buses may use the same SCSI ID number. (For example, you can have a removable media drive with ID number 3 connected to the computer's built-in regular SCSI bus and a hard disk with ID number 3 connected to the Ultra Wide SCSI bus.)

Important: Hard disks installed in your computer at the factory and the SCSI card have reserved certain SCSI ID numbers on the Ultra Wide SCSI bus. Other ID numbers are available for assignment to SCSI devices that are added later, as described in the following table.

Ultra Wide SCSI ID No.	Device
0	Factory-installed hard disk drive (terminated)

1 through 6	Available (If your computer came with two or more Ultra Wide SCSI hard disk drives, use the System Profiler program (available in the Apple menu) to find out the SCSI ID numbers of your drives.)
7	SCSI PCI card (terminated)
8 through 15	Available

If you want to install an internal SCSI-3 drive, use the internal ribbon cable with the 68-pin connector to connect the device to the Ultra Wide SCSI bus.

Warning! Do not connect any SCSI devices to the external 68-pin SCSI-3 connector or to the internal 50-pin SCSI-2 connector on the PCI card that supports the internal hard disk. Connecting even one external SCSI device to the external 68-pin connector extends the overall cable length of the SCSI bus beyond the limit for which error-free operation can be guaranteed; the combined length of the internal cable and the external cable reduces the reliability of all the devices connected to the Ultra Wide SCSI bus. Connecting a device to the internal 50-pin SCSI-2 connector will cause your Ultra Wide SCSI devices to transfer data at the slower, SCSI-2 rate.

Mac OS 8.5: System Freezes When Opening Help Viewer

I moved my Help Viewer window off the screen, up and to the left, by dragging the window with one of its edges. Now, when I try to open the Help Viewer, my computer freezes.
This article has been archived and is no longer updated by Apple.
The solution is to throw away the Apple Help Viewer Preferences. The Apple Help Viewer Preferences are located in the Apple Help Viewer folder in the Preferences folder. Once the old preferences for the Apple Help Viewer are deleted, the Help Viewer then opens at the default position.

Mac OS 8.6 resolves the issue.
Published Date: Feb 19, 2012

QuickTime 4.0.x: System Requirements

This article outlines the system requirements for QuickTime 4.0.x.
This article has been archived and is no longer updated by Apple.

Mac OS

- 68020, 68030, 68040, or PowerPC processor (PowerPC processor recommended for effects, 3D, Floating-Point Audio, DV, MPEG, RTP streaming features, or QDesign Music)
- 68000-family microprocessor based Macintosh computers must also support Color QuickDraw
- At least 8MB of RAM (random-access memory) recommended for 680x0-based computers; at least 16MB of RAM recommended for PowerPC-based computers
- Mac OS 7.1 or later. QuickTime's RTP streaming works with Mac OS 8.0 or later because it requires OpenTransport 1.2--or later--part of Mac OS 8.0.

Windows

- Intel or compatible processor or any MPC2- compliant PC (minimum 66-MHz 486 processor; also supports Pentium, Pentium Pro, and Pentium II with MMX processors; Pentium processor recommended when using effects, 3D, Sorenson Video, DV, RTP streaming features, or QDesign Music)
- At least 16MB of RAM
- Windows 95, Windows 98, or Windows NT 4.0 system software
- Sound Blaster or compatible sound card and speakers
- Installation of Direct X version 3.0 or higher is recommended for best performance
- Installation of DirectDraw and DirectSound drivers is recommended for best performance

Note: QuickTime 4.1 has system requirements greater than QuickTime 4.0.x. For more information see Knowledge Base article 60686: "**QuickTime 4.1 System Requirements**."
Published Date: Feb 20, 2012

Mac OS 8.5: Unable To Install With Large Disk Cache

After starting up from the Mac OS 8.5 installation disc and opening the installer program, the following alert dialog is displayed:

The applications "DFA Server" could not be opened because there is not enough memory available to continue. Try quitting other applications to make more memory available.

What should I do to complete the install?
This article has been archived and is no longer updated by Apple.
This situation can occur in memory configurations, where a large amount of RAM has been allocated for the disk cache in the Memory control panel.

Starting up from the installer disc with the Shift key held down will revert back to the minimum size of the disk cache (96KB) and will consume less memory, so that the installation may proceed.

Mac OS: How to Move the Control Strip

This article explains how to change the position of the Control Strip.
This article has been archived and is no longer updated by Apple.
To move the Control Strip:

1. Press and hold down the Option key.
2. Drag the tab at the end of the Control Strip. If you drag it more than halfway across the display, the Control Strip moves to the other edge. If you have more than one display, you can drag the Control Strip to the left or right edge of the other display as well. The Control Strip always stays on the left or right edge of your display.

Changing the display's resolution from a smaller setting to a larger one and restarting the computer moves the Control Strip higher up on the display.
Published Date: Feb 19, 2012

Mac OS 8.5: Finder AppleScript Dictionary No Longer Has ‘obsolete‘ Suffix For Properties

The 'obsolete' keywords in the Finder's AppleScript Dictionary are no longer present. Has this compatibility feature been removed?
This article has been archived and is no longer updated by Apple.
Structural changes in the Finder between System 7 and Mac OS 8 required special script coding to maintain compatibility for the "locked", "file type", "creation date", "modification date", and "folder" properties of an item.

The word 'obsolete' was placed after these properties in scripts written within Mac OS 8 in order to have them work with the System 7.x Finder. The terminology in the Mac OS 8.0 and Mac OS 8.1 Finder dictionary contained references to this technique.

The 'obsolete' parameter is still usable with Mac OS 8.5. However, the Finder dictionary in Mac OS 8.5 no longer contains the 'obsolete' parameters.

The following script is an example showing how to write AppleScripts for the Finder, accessing these properties, that are compatible across System 7.x and Mac OS 8.x.

```
set SysFldrPath to path to system folder as text -- some item, here the System folder
set SystemPath to SysFldrPath & "System" as text

tell application "Finder"
get the version -- of the Finder
set FinderVersion to the result as text

if FinderVersion is less than "8.0" then
--Pre Mac OS 8
get locked obsolete of SystemPath -- file property
get file type obsolete of SystemPath -- file property

get the creation date obsolete of alias SysFldrPath -- item property
get the modification date obsolete of alias SysFldrPath -- item property
else
--Mac OS 8
get locked obsolete of SystemPath -- file property
get file type obsolete of SystemPath -- file property

get the creation date of alias SysFldrPath -- item property
get the modification date of alias SysFldrPath -- item property
end if
end tell
```

Published Date: Feb 20, 2012

Mac OS: Apple CD/DVD Driver: Only Mac OS Volumes Appear on the Desktop

The Apple CD/DVD driver does not make the multiple volumes on enhanced or hybrid discs appear on the desktop.

This article has been archived and is no longer updated by Apple.

This is the expected behavior. Having multiple volumes from one disc appear on the desktop causes confusion. To eject a disc that has multiple volumes appearing on the desktop, you must drag the icons for all of the disk volumes to the Trash. If you drag only the icon for one of the volumes the computer will not eject the disc.

Final Cut Pro 1.0: Setting Scratch Disk Preferences

This article explains how to set scratch disk preferences in Final Cut Pro.
This article has been archived and is no longer updated by Apple.
The scratch disk is a folder on a hard disk or other storage medium where the program stores its media source files, including captured video and audio and rendered files. Always use your fastest audio/video (A/V) disk drives as your scratch disks. For best performance, avoid setting the system hard disk as the scratch disk and do not use a disk that has virtual memory turned on.

To change scratch disk preferences:

- Open the Edit menu and choose Preferences, then click the Scratch Disks tab.

Scratch disk options include:

- Capture Audio and Video to Separate Files: when on, video and audio are saved separately, which allows for better performance during playback and capture. To save audio and video files separately, you must specify a different disk for each (no tincluding the system disk).
- Video, Audio, Render storage: the disk or folder where video, audio, and rendered files are stored; specify more than one disk for increased storage space. The program automatically uses the specified disk with the most space available (rendering) or the next disk listed (capturing) when the current disk runs out of space.
- Waveform Cache: the folder or disk for waveform cache files (graphical representations of audio signals)
- Thumbnail Cache: the folder or disk for thumbnail cache files
- Minimum Allowable Free Space on Scratch Disks: when disk space falls below this minimum, the program will use another specified disk

Published Date: Feb 20, 2012

Final Cut Pro 1.0: Setting Up For Video Capture

You need to adjust several types of settings before capturing video from an external source. These settings include device control preferences, video signal settings, capture preferences, and clip settings.
This article has been archived and is no longer updated by Apple.

Setting device control preferences

Before you can begin logging and digitizing source footage, you must set device control preferences. (To use device control, you must have an external video source that is compatible with the program. See Final Cut Pro's World Wide Web site for more information.)

To set device control preferences:

1. Open the Edit menu and choose Preferences.
2. Click the Device Control tab.
3. Select Enable Device Control, unless you are not using a controllable video source.
4. Use the pop-up menus to choose the broadcast standard for your system, the computer port to which your device control cable is connected, the edit protocol your deck (or other device) uses, and the timecode source you want to use.
5. Turn off Use Deck Search Mechanism if your deck has difficulty moving the playhead to a specified timecode during capture or searching.
6. Set intervals for pre-roll, post-roll, timecode offset, handle size, and playback offset for the video being played.

Note: If the timecode you capture doesn't match the timecode on your video deck, you need to change the timecode offset or playback offset. See "Calibrating the Timecode Signal You Are Capturing" in Chapter 5 of the "Final Cut Pro User's Manual."

Setting capture preferences

Capture preferences determine the quality at which Final Cut Pro captures video. You must set these preferences before capturing any video.

To specify capture preferences:

1. Open the Edit menu and choose Preferences.
2. Click the Capture tab.
3. Choose a capture quality setting from the pop-up menu at the top of the window.
4. Set capture preferences.

   The video and audio options you can set depend on the video capture card you're using. Your video and audio preferences are stored as part of the capture quality settings.

   Be sure that your capture settings match the hardware you're using and that you've set your best-performing disk drive as the scratch disk. The scratch disk must be able to sustain transfer at the data rate you set, or frames will be dropped.

For best performance

Select the box labeled "Always Turn Off AppleTalk When Capturing." If you select this option, the program turns on AppleTalk when you quit Final Cut Pro.

Make sure that no part of the window that's playing video while capturing is covered by another window or partially offscreen. Make sure that the window is on the correct monitor (the one connected to the capture card, for example).

If you want to switch between sets of capture preferences:
You can save up to four sets of capture preferences and choose the one you want to use before capturing footage.

If you want to change the frame size:
Choose a size from the Aspect Ratio pop-up menu, or enter sizes in the Width and Height boxes.

If you want to set options for dropped frames:
*Select Abort to stop capturing video if frames are dropped during capture.
*Select Report to complete capturing video if frames are dropped, and to see a report of dropped frames.

If your video capture card lets you play and capture video at the same time:
Select the box labeled "Capture Card Supports Simultaneous Play Through and Capture."This is only used for Edit to Tape; it does not affect capture.

Adjusting clip settings for capturing video and audio

Before you begin logging and capturing footage, you may want to adjust the incoming video signal to ensure the best image quality.

You can adjust settings for capturing or logging video, including hue, saturation, brightness, contrast, sharpness, black level, white level, and gain.

Note: Not all video capture hardware has these adjustments; for example, DV sources do not.

Clip settings are saved with the clip; every time you recapture the clip, these settings are used. To override clip settings, turn off "Use Clip Settings" in the Batch Capture dialog box.

To adjust clip settings for capturing video:

1. Open the File menu and choose Log and Capture.
2. Use the transport controls in the Log and Capture window to play the color bar portion of your tape.
3. Click the Clip Settings tab.
4. Adjust the video settings you want to change.
5. Use the Gain slider to adjust the audio signal so that it does not peak into the red areas of the audio monitors.
6. Choose the type of signals you want to capture from the Capture pop-up menu.
7. Choose an option from the Audio Format pop-up menu.

Audio formats include:

- Ch 1+ Ch 2: two channels of audio, with two tabs in the Viewer; each channel is panned to the center (the sound comes from both speakers equally).
- Ch 1 (L) or Ch 2 (R): captures only the left or right channel from the deck.
- Stereo: two audio tracks on one tab in the Viewer; the tracks are panned to the left and right.
- Mono Mix: takes both channels and mixes them to one track, which is panned to the center.

Tip: It's a good idea to record at least 30 seconds of standard color bars to use when making adjustments for capturing.

Adjusting the Waveform Monitor and Vectorscope

You can fine tune the video signal when preparing to capture video. For instructions, see "Calibrating Capture Settings with Bars and Tone from Tape" in Chapter 5 of the "Final Cut Pro User's Manual."

Using the Wavefore Monitor and Vectorscope affect performance when capturing. Once you've adjusted your settings, close the Waveform Monitor and Vectorscope window before capturing.

Final Cut Pro 1.0: Logging Video Footage

This article describes how to log video with Final Cut Pro.
This article has been archived and is no longer updated by Apple.
To log video with Final Cut Pro, you need a controllable video device.

Final Cut Pro logs shots by creating offline clips that it stores in a bin of your choice. When you complete logging, you can select the offline clips you want to capture and digitize them in a batch.

To log footage:
1. Make sure your video deck is properly connected and set to its remote setting.
2. Choose Log and Capture from the File menu.
3. Click the Logging tab.
4. Specify a logging bin (where offline clips are stored during logging) by Control-clicking the bin you want and choosing Set Logging Bin from the pop-up menu.
5. Type a name for the reel (the tape or other video source). Click the Slate button to have the program add a numeric reel name.
6. Name the clip in the Label box, or select Prompt if you want to name each clip as you log it (useful if you use keyboard shortcuts during logging).
7. Use the transport controls in the Log and Capture window to control your source deck and find the footage you want to log.

Figure 1, Transport controls

A - Shuttle Control: Drag to the right or left changes the speed of fast forward or rewind.
B - Rewind
C - Play In to Out
D - Stop
E - Play
F - Play Around Current
G - Fast Forward
H - Jog control: Drag to move frame by frame

8. Mark a clip by doing one of the following:

- Click the Mark In and Mark Out buttons, or press "i" to set the In point and "o" to set the Out point.
- Enter specific timecodes (In on the left, Out on the right) in the timecode fields at the bottom of the Log and Capture window.

9. Log a clip by doing one of the following:

- If the Prompt option is on, click Log Clip and type a name. Type a note in the Log Note area to use for locating this clip quickly.
- If the Prompt option is off, click the Slate button next to the fields you want to increment, then click Log Clip.

10. To add a marker to a clip while logging, click the indicator next to Markers at the bottom of the logging tab. Enter a marker name, In and Out timecodes, and comment as desired, and click Set Marker. These markers appear as subclips in the Browser once a clip is captured.

AppleWorks 5: How to Open a Microsoft Word Document

This article explains how to open a Microsoft Word document with AppleWorks 5.
This article has been archived and is no longer updated by Apple.
An error may occur when you try to open Microsoft Word 6 or later files with AppleWorks 5 (and ClarisWorks 5) by double-clicking on the file. AppleWorks 5 includes translators for Word 5 files and earlier. AppleWorks 5 does not include translators for Word 97 (PC), Word 95/6.0 (PC/Mac), or Word 98 (Mac) file formats, and cannot open these files.

Workarounds

1. To open a Microsoft Word 6 document using AppleWorks 5 (and ClarisWorks 5), drag the file onto the AppleWorks 5 application icon. Double-clicking the file will not work (unless you have installed a third-party translation program).

2. To open a Word 97 (PC), Word 95/6.0 (PC/Mac), or Word 98 (Mac) file, save the file in text (.txt), or rich text format (.rtf), then open it with AppleWorks 5. Rich text format retains most of the document's formatting. Text format retains the text but loses any format and style.

Some utilities like MacLink Plus and Conversion Plus can also help you open different file types with AppleWorks 5.

PowerBook G3 Series: Floppy Drive Not Recognized By Virtual PC

The floppy drive module in my PowerBook G3 Series computer is not recognized by Connectix's Virtual PC software when it is inserted in the left expansion bay. If the floppy module is placed in the right side bay, it is recognized and works fine with Virtual PC. Why is this?

This article has been archived and is no longer updated by Apple.

Connectix has verified this situation and has created a fix in the form of an updater. Running the Virtual PC 2.1.3 updater software should remedy this issue.

Published Date: Feb 20, 2012

QuickTime 4: MP3 VBR Encoding Supported in Version 4.1

The QuickTime Player included with QuickTime 4 seems to open some MP3 audio files but not others. Why is this?
This article has been archived and is no longer updated by Apple.
QuickTime 4 supports the majority of available MP3 audio files. QuickTime 4.1 can also play MP3 files encoded with VBR (variable bit rate). QuickTime 4.0.x only supported CBR (constant bit rate) MP3 encoding. To play MP3 files with VBR encoding, you should upgrade to QuickTime 4.1.

See article 60690 "**QuickTime: How to Upgrade To QuickTime 4.1**" for more information on upgrading to QuickTime 4.1.

Mac OS X Server: Does Not Work With ADB Hardware Copy Protection Devices

On a computer running Mac OS X Server and MacOS.app, even though MacOS.app is a full virtual Macintosh implementation and gives every appearance of full Mac functionality, there are certain kinds of hardware that do not work, even though they work normally under Mac OS 8.
This article has been archived and is no longer updated by Apple.
The Mac OS X Server Release Notes state, "Direct ADB access is not supported. Applications that read directly from ADB devices and expect mouse ADB events will not work."

Mac OS X Server is a direct descendant of BSD unix, implemented using the Mach microkernel. As a rule, an operating system is tightly wedded to the hardware on which it runs, and Mac OS X Server is no exception, so it is accurate to say that "Mach owns the hardware".

MacOS.app is a complete and robust implementation of a virtual computer (a virtual Macintosh) that runs as an application within the Mach OS. As such, it directs all input/output requests to the Mach kernel or its processes. Because of this, ADB devices, serial devices, SCSI devices, and PCI devices must be addressed from MacOS.app using standard system calls (most of which are mapped very directly to Mach-side APIs). Any program that attempts to access hardware or memory locations directly from the Blue Box may be ignored, but will more likely hang or crash MacOS.app, often in spectacular or profound fashion. This may not always be escaped with the Command-Shift-Q keyboard force-quit for MacOS.app, either, accounting for another situation in which telnet access can be handy.

Thus, devices such as ADB copy-protection "dongles", and some ADB devices such as ADB modems, serial switches, and pointing devices may fail to work or cause MacOS.app to hang or crash. PCI boards that are otherwise unrecognized by BSD and Mach may lead to similar situations if Mac OS drivers are installed within the MacOS.app environment. Programs that issue low-level SCSI commands (such as RAID utilities, disk formatters, and maintenance utilities like SCSI Probe or third-party CD ROM drivers) can be expected to cause similar problems within MacOS.app.

For more information about telnet and Mac OS X Server, see the following article:

Article 60092: "**Mac OS X Server: Why and Why Not to Allow Remote Login.**"

For more information about ADB and other hardware support, see the following article:

Article 60124: "**Mac OS X Server Release Notes**."

QuickTime 4: What‘s New

This article outlines the new features in QuickTime 4.
This article has been archived and is no longer updated by Apple.

- Streaming Internet services
  - Play live and stored streaming video and audio using standards-based low-bit-rate compressors and decompressors
  - Experience smooth playback even over 28.8-Kbps modems
  - Network protocol support: HTTP, RTP/RTSP, FTP
  - URL data handler
  - Ability to open an HTTP, RTSP, or FTP URL, including password-protected FTP sites, in the QuickTime Player
- Easy-to-use QuickTime Player interface
  - Visible Timecode and audio EQ display
  - Single-click access to your favorite QuickTime movies
- Automatic selection of the best-quality movie for a given Internet connection, processor speed, or spoken language
  - Internet decompressors: H.263, GSM, MS DVI, RTP DVI, MPEG-1 Layer 3 (MP3)
- Small, fast dynamic Internet installer
  - Component installation updates your system as you need it
- Optimized audio sample rate conversion for improved playback quality
- Bass, treble, and balance control
- Sophisticated lens flare and zoom effects
- QuickTime API support for Java
- QuickTime VR speed and accuracy improvements
- QuickDraw 3D support for compressed textures and wired sprite actions
- QuickDraw 3D performance improvements
- Media import and export for PNG, TIFF, TARGA, MacPaint, Macromedia Flash, and FlashPix formats (import only for FlashPix)
- Image sequence movie exporters

QuickTime 4: 10 Great Reasons to Upgrade to QuickTime 4 Pro

Ten great reasons to upgrade to QuickTime 4 Pro:
This article has been archived and is no longer updated by Apple.

1. Create and edit your own streaming movies from existing QuickTime content
2. Convert pictures and still images between standard publishing formats
3. Add special effects to your movies
4. Provide full-screen movie playback
5. Make presentations and slide shows that can be played back with any application that supports QuickTime 4
6. Compress video using the state-of-the-art Sorenson Video 2 compressor
7. Export video, audio, and pictures to more than a dozen standard file formats
8. Enable, disable, or extract specific tracks of a movie
9. Compress audio using QDesign Music 2 up to 100:1 for Internet streaming
10. Save movies from web sites

Mac OS X Server 1.0: Ethernet Interface Can Have Multiple IP Addresses

You may (as the Administrator, or root user) use the `ifconfig` command to add IP addresses to a single Ethernet interface. In this example, IP addresses other than the first IP address are added for the first Ethernet interface (en0).
This article has been archived and is no longer updated by Apple.
Type the following commands in a Terminal window:

```
ifconfig en0 down
```

This takes the interface down and is required before changing configurations.

```
ifconfig en0 alias 123.456.789.101 netmask 255.255.255.0
```

This adds additional IP address of 123.456.789.101 to this interface with netmask of 255.255.255.0

```
ifconfig en0 up
```

This brings the interface back up.

Test the new IP address by ping or telnet.

The ifconfig command may also be used to configure a port with a single IP address or change existing configurations. These steps are simpler to perform from Network Preferences (under the Apple menu).

More information about ifconfig is available by typing `man ifconfig` at the command prompt.

Note: Type the desired IP address in the place of 123.456.789.101 above.

Password Security: May Not Accept Password If Keyboard Layout Changes

I have changed my keyboard layout since first entering my password into the Password Security control panel. Now the control panel will not accept my password. Why is this?
This article has been archived and is no longer updated by Apple.
Because Password Security loads so early in the startup process, it is forced to use the native keyboard layout, no matter which layout is chosen in the Keyboard control panel. This is normally not a problem since as long as you type the same keys, Password Security will interpret the password as the same. However, if you change the keyboard layout and then type your password using the new keys to match the same characters, Password Security will reject the password since the key strokes are different.

To get around this, simply type the password as if the original keyboard layout were selected. Then, if you intend to use the same keyboard layout, open the Password Security control panel and reenter the password with the new layout.

There is an issue with Password Security 2.0, which is included with Mac OS 8.5. If a user has a 2-byte (Chinese, Korean, Japanese) Language Kit installed, and Font and Keyboard Synchronization disabled in the Keyboard menu; a user can potentially enter a 2-byte password. Since the Language Kit input methods aren't yet loaded at the point where the Password Security dialog appears during startup, it is possible to create a password that can't be typed. This issue is addressed in Password Security 2.0.1, which is part of the Mac OS 8.6 update.

Note: This article mentions an Apple software update. You may search for software updates in the Apple Software Updates Web site at **http://www.apple.com/swupdates**.

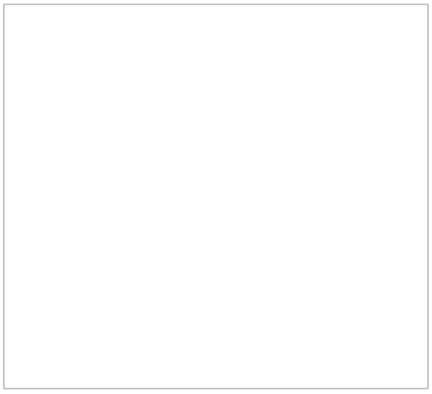
QuickTime 3: Can‘t Hear Audio In Movies

I'm using QuickTime 3 and I'm using trying to play a movie. I can see the video, but I can't hear any sound from it at all--even with the volume all the way up. What is wrong?
This article has been archived and is no longer updated by Apple.
One possible issue is that QuickTime 4 introduced a new compression format for sound called "QDesign Music 2". Quicktime 3 does not support this new compression. Thus, if the movie file in question was created using the QDesign Music 2 compression format in QuickTime 4, then users of QuickTime 3 will be able to play the movie and see the video, but they will not hear any audio.

If you have a Pro version of QuickTime, and you have a local copy of the movie, here is a way to verify if this is the case:

- Open the movie in Movie Player (or QuickTime Player)
- Choose Get Info from the Movie menu
- Choose Sound Track from the left pop-up menu and choose Format from the right pop-up menu.

If you are using QuickTime 3 Pro, under "Compression", if it will say "Unknown."



If you are using QuickTime 4 Pro, under Compression, it will say "QDesign Music 2"

If this is the case, there are two solutions to this issue:

1. Download and install QuickTime 4 on the computer where you want to play the movie, or
2. Open the movie on a computer that has QuickTime 4 Pro installed and export it using a different sound compressor that is supported by QuickTime 3.

Published Date: Feb 20, 2012

QuickTime 4: Known Issues

This article lists known issues with the GM (final) release of QuickTime 4.
This article has been archived and is no longer updated by Apple.
Platform: Mac
Issue: Some games may give an error on launch if a Minimum installation of QuickTime 4 is used.
Workaround: Use the Full install option.

Platform: Mac
Issue: The default amount of memory allocated to a web browser on a Macintosh is often not enough to view streaming movies using the QuickTime 4 plug-in, and can sometimes result in system unresponsiveness.
Workaround: If you want to watch streaming movies in your web browser program, you should increase the amount of memory allocated to it.

Platform: Mac
Issue: Using a Startup Movie that uses the Sorenson codec will cause an unimplemented trap error at startup.
Workaround: Do not use a Startup Movie, or use one that does not use the Sorenson codec.

Platform: Windows
Issue: If "Show window contents while dragging" is enabled, users might experience redraw anomalies while dragging a window over a QuickTime movie playing in the background.
Workaround: Do not drag another window over a QuickTime movie which is playing, or consult the documentation that came with your computer for information on turning off "Show window contents while dragging".

Final Cut Pro 1.0: Newer Version of G3 Firmware Updater Available

Apple has posted a newer version of the Power Macintosh G3 Firmware Update than that on the Final Cut Pro 1.0 disc.
This article has been archived and is no longer updated by Apple.
The version posted to the Apple Software Updates Web site at http://www.apple.com/swupdates/ is newer than the one that was included on the Final Cut Pro disc (version 1.0.1). Apple recommends that all Power Macintosh G3 (Blue and White) customers download and install the most recent firmware updater for their computer. It is not necessary to install version 1.0.1 before installing the most recent version.

Note: If you install the most recent version of the firmware updater, and then attempt to install the 1.0.1 version of the firmware updater after that, you will receive and error dialog box that says you already have a newer version of firmware and it will not allow you to run the updater.
Published Date: Feb 20, 2012

Mac OS X Server: Capturing and Streaming QuickTime Video

Can I use the same computer to simultaneously capture QuickTime video and stream it on the Internet?

See the QuickTime Streaming Server website for more information.
This article has been archived and is no longer updated by Apple.
QuickTime Streaming Server (QTSS) can stream pre-recorded QuickTime-compatible audio and video (media) originating at the server, as well as reflect live multicasts and unicasts (broadcasts) originating from another computer (or source).

QTSS can reflect any QuickTime-compatible broadcast. Examples of this range from a Mac OS computer using Sorenson Broadcaster to a Windows NT computer using Cisco IP/TV, IBM VideoCharger, or SGI WebFORCE MediaBase.

Reflecting a signal can be useful in separating high-bandwidth (broadband) users on the intranet from low-bandwidth users on the Internet. In this scenario, video is captured and compressed on a transmitter (computer), and broadcast to a QuickTime Streaming Server computer(s), or local viewers. Remote viewers on the Internet connect to the reflected stream through QuickTime Streaming Server.

By separating the two tasks (broadcasting and reflecting) it is much easier to tune the performance of both computers. Reflecting a broadcast also allows for scaling, with the addition of multiple QTSS reflectors or multiple source computers.

Capturing and compressing video and audio in real time consumes the majority of a computer's bus and CPU resources. Adding server responsibilities on top of that only increases the demand on system resources and can diminish performance.

Stored movies can be compressed for higher quality or multiple data rates at slower than real time, before uploading to a busy server--thus allowing for remote administration.

Note: QuickTime 4 is required to view streaming movies on a Mac OS or Windows client.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Pro 1.0: How To Work Without Rendering

In general, you need to render transitions, effects, and composited layers to play a sequence smoothly. Sequences consisting of cuts only do not require rendering for playback as long as sequence size and frame rate match the original source material.
This article has been archived and is no longer updated by Apple.
To avoid rendering when creating a sequence with cuts only, make sure that the sequence's editing timebase, frame rate, and compression settings are the same as the frame rate, frame size, and compression settings of your source media. If the frame rate, frame size, or video or audio compression settings in your source media are different from those settings in your sequence, those frames need to be rendered before the sequence can be exported or printed to video.

To view the compression settings for source material:

1. Select the clip in the Browser or Timeline.
2. Choose Item Properties from the Edit menu.

Item Properties window

Or:

1. Select the clip in the Browser or Timeline.
2. Choose Analyze Clip from the Tools menu.

Analyze Clip window

Every Final Cut Pro sequence has a set of properties that determines the sequence's editing timebase (or frame rate), frame size, compression settings, and various display options. This set of properties is known as a preset. When a sequence is created, the chosen preset becomes the sequence settings for the new sequence. Final Cut Pro comes with a collection of presets that you can apply to your sequences. The following rules determine the way that sequence presets are used:

- When you create a new sequence, the default preset is automatically applied to it.
- If you have selected the "Prompt on New Sequence" box in Sequence Presets, you will be prompted to choose a preset from those which have been previously saved.

- You can create, delete, and edit presets. Creating a preset doesn't apply it to a sequence. It just saves it for future use.
- If you want to change the settings for an existing sequence, you use the Settings command in the Sequence menu. This allows you to change everything except the frame rate for the sequence. Changing a sequence's settings has no effect on the preset that was applied to the sequence, and changing a preset does not affect any sequences to which that preset was previously applied.

Sequence Settings window

You can also avoid unnecessary rendering by nesting sequences within other sequences. Refer to the section named, "Using Nested Sequences," on pages 245 and 267 of the Final Cut Pro Manual.

Tip: Pressing the Caps Lock key temporarily disables rendering. This allows you to adjust all of your settings before rendering a preview. It does not speed up final rendering, but allows you to work faster without the processing overhead of background rendering.

QuickTime: Creating Movies Optimized For Web Playback

This article has been archived and is no longer updated by Apple.

This article explains how to make movies that are optimized for playback at various data rates on the Internet.

There is a very powerful feature of QuickTime that works with "fast start" movies or "rtsp streamed" movies. Users can let QuickTime automatically detect their Internet connection speed in the Streaming panel in QuickTime Preferences.

On the server side, content creators can embed a single movie into a web page that automatically senses the client's connection speed, and plays back the movie with the appropriate data rate. This way, clients connected with a 28.8 kbps modems don't have to wait for long downloads of high-bandwidth movies (or stream movies that would exceed the available bandwidth). At the same time, clients with faster connections can view higher quality movies.

To take advantage of this feature, you first need to export movies for different internet connection speeds. You can do this with QuickTime Player Pro and other QuickTime based programs. For each movie, you can adjust many aspects of the file in order to make it smaller for slower connection rates (such as movie size, codec, data rates, frames per second, etc.). When you have created the multiple versions of your movie, you need to create what is called a "reference movie." The reference movie acts like an "alias" in many respects--it basically serves as a pointer to the different movie files you have created.

To create a reference movie, you need a tool, such as Media Cleaner, or Apple's MakeRefMovie application. To learn how to make reference movies with MakeRefMovie, go here. For more information on these and other QuickTime authoring tools, see the QuickTime website.

Finally, put the movie files on your server, and then embed the single reference movie into your web page and the QuickTime plug-in will automatically handle the rest.

QuickTime 4: About QuickTime Streaming

QuickTime Streaming extends the QuickTime software architecture to support the creation, transmission, and playback of multimedia streams. This allows QuickTime programmers to create applications that send and receive multimedia in real time, and to create authoring and editing tools that work with streaming content.
This article has been archived and is no longer updated by Apple.
QuickTime Streaming is a capability supported by QuickTime 4 to view live and video-on-demand QuickTime movies using industry standard RTP (Real-time Transport Protocol) and RTSP (Real Time Streaming Protocol). Support is provided to view streaming live content, previously-recorded movies, or a mixture of both. Broadcasts can be one-to-one (unicast) or one-to-many (multicast). Existing applications that play QuickTime movies can play streaming movies with little or no code change. QuickTime Streaming also extends the QuickTime file format to support streaming. Local movies can contain streaming tracks, which call up live content or video-on-demand when the movie is played.

The new QuickTime streaming capabilities are perfect for:

- Viewing and listening to long files
- Providing random access to any moment in a long program
- Viewing live events

QuickTime Streaming FAQ

1. Where can I find QuickTime Streaming content?
2. How do I view streaming content?
3. Why is QuickTime Streaming useful?
4. What are the advantages of using QuickTime Streaming?
5. What is the difference between live and video-on-demand streaming?
6. What is the difference between HTTP "fast-start" streaming and RTSP "live" streaming?
7. How can I broadcast my own streaming multimedia content?

Question 1: Where can I find QuickTime Streaming content?

Answer: There are audio and video samples available on the Apple QuickTime Web Site at http://www.apple.com/quicktime/. We expect third-party sites to also begin offering QuickTime Streaming content.

Question 2: How do I view streaming content?

Answer: Viewing QuickTime Streaming is as easy to view as QuickTime has always been. You have the ability of viewing a streaming movie using your web browser with the QuickTime Plug-In or by using QuickTime Player. In fact, any application which currently supports QuickTime 3 or later is capable of viewing QuickTime Streaming content.

Question 3: Why is QuickTime Streaming useful?

Answer: Streaming allows you to view live events such as concerts and video-on-demand movies. Streaming also allows many users to tune in to one stream, decreasing the amount of bandwidth which would otherwise be consumed by http streaming.

Question 4: What are the advantages of using QuickTime Streaming?

Answer: Using QuickTime Streaming as a solution allows you to utilize the QuickTime 4 features such as effects, chapter tracks, MIDI, alternate language tracks, poster effects, overlays, client-side transforms, and alternate data rate selections.

Question 5: What is the difference between live and video-on-demand streaming?

Answer: Live Streaming is a live broadcast which allows users to join a session in which real time media is being sent over a network. Because these streams are live, users are not allowed to jump around to any point in time. Video-on-demand represents content stored on a streaming server which can be viewed at any time. Unlike live streaming, video-on-demand allows users to jump to any point in time in the media.

Question 6: What is the difference between HTTP "fast-start" streaming and RTSP "live" streaming?

Answer: The new live streaming capabilities of QuickTime 4 are complementary to the QuickTime HTTP (Hypertext Transfer Protocol) streaming that is currently built into QuickTime 3. QuickTime HTTP, otherwise known as "fast-start", downloads the entire QuickTime file to your computer. As soon as enough of the content has been downloaded, it will begin to playback the movie while downloading the rest of the file. QuickTime RTSP Streaming does not download the movie to the computer, but loads and plays the movie in real time as the data is received.

For a demonstration of QuickTime RTSP Streaming, visit the Apple Computer QuickTime web site:**http://www.apple.com/quicktime/**

You must have QuickTime 4 software installed on your computer in order to view QuickTime Streaming content.

Question 7: How can I broadcast my own streaming multimedia content?

Answer: QuickTime 4 software allows you to only view streaming content, but does not provide the ability to broadcast. For this capability, a QuickTime-compatible streaming server solution such as Mac OS X Server with QuickTime Streaming Server Software is required.

Mac OS 8.6: Open Transport 2.0.3 Read Me

This Read Me document contains late-breaking information about Open Transport and 3rd party software compatibility information. For instructions about how to use the Open Transport control panels (AppleTalk and TCP/IP), choose Mac OS Help in the Finder's Help menu.

For additional technical information about Open Transport, see the "OT 2.0 Technical Info - Part 1" and "OT 2.0 Technical Info - Part 2" documents. These documents can also be found in the OT Extras folder in the CD Extras folder on your Mac OS 8.6 CD.
This article has been archived and is no longer updated by Apple.

Contents

What's new in Open Transport 2.0 - general
Bugs addressed
Network interface options
General compatibility
Apple product compatibility update
Known limitations and other issues

What's new in Open Transport 2.0 - general

- Open Transport 2.0 now supports AppleScript. Through the use of Network Setup Scripting (NSS) Macintosh users can use AppleScript to configure all network communication options currently available in the AppleTalk, Infrared, Modem, Remote Access, and TCP/IP control panels. NSS operates locally and remotely, offering powerful automation capabilities to end users and network administrators.
- Open Transport's implementation of the Dynamic Host Configuration Protocol (DHCP) has been improved to support Client Identification and retention of the lease on a given IP address across reboots.
- The Open Transport DHCP implementation now supports RFC 2131, and the temporary generation of an IP address when no DHCP server is available. For more information, see "OT 2.0 Technical Info - Part 1" for more information.
- When using the new DHCP Client ID feature, the Client ID is entered into a new field in the TCP/IP control panel.
- Support for the Simple Network Management Protocol (SNMP) is available for Open Transport. Support for the version 2 Management Information Base (MIB II), instrumentation for AppleTalk and TCP/IP protocols and transports, administrative tools, and system agent support for the PCI bus is now provided. For more information, see the Open Transport SNMP Read Me on your Mac OS 8.6 CD.
- In the TCP/IP 2.0 control panel, users can now enter an IP address in standard "dot" notation in the IP Address text box, and immediately follow it with a slash ("/") and a number ranging from 1 to 32 (indicating the number of contiguous one bits in the subnet mask, counted from the high-order bit). For example, if a user's IP address is "198.162.22.10", and the appropriate subnet mask is "255.255.255.252", the user can enter "198.162.22.10/30" in the IP Address text box.

Issues Addressed

- The following issues have been addressed in Open Transport 2.0.3:
- Open Transport fixes several issues with DHCP:
  - DHCP now sends out a decline packet when detecting a duplicate IP address.
  - An issue was fixed which could cause a computer to become unresponsive when acquiring a DHCP lease.
  - Issues with DHCP and some brands of cable modems have been fixed.
- The AppleTalk control strip can now be used to turn AppleTalk on and off.
- Open Transport 2.0.3 now fixes several issues with the OT Printer Access Protocol (PAP) Client.
- Miscellaneous fixes are included in Open Transport that increase overall performance and reliability.

Network interface options

Open Transport supports PCI bus, NuBus, communications slot, and PC Card network interface cards, as well as Token Ring, Ethernet, and built-in LocalTalk network adapters. Open Transport 2.0 also supports a SCSI-attached network adapter for computers without expansion options. Third party network interface options available for Open Transport include Ethernet, ATM, and FDDI.

General compatibility

Open Transport is compatible with the following existing products:applications that use AppleTalk as specified by Apple, Inc.

- applications that use MacTCP as specified by Apple, Inc.
- devices (such as printers) that you select in the Chooser
- Ethernet PCI and NuBus network interface cards for the Mac OS Computers running Open Transport can be added to an existing AppleTalk or TCP/IP network without upgrading other computers on the network.

Apple product compatibility update

- At Ease version 2.x or 3.x may encounter difficulties when starting up with Open Transport. At Ease Update 1.0 will update non-Workgroup versions of At Ease 2.x or 3.x to include Open Transport compatibility. If you are using At Ease for Workgroups, you should upgrade to version 3.0.2 or later. Both can be found on Apple Software Update sites on the Internet and selected online services.
- Apple exited the market as a vendor for Token Ring products. Apple has no plans for any new Apple-branded Token Ring products for Mac OS. Apple is no longer a vendor for Token Ring products. Apple has no plans for any new Apple-branded Token Ring products for Mac OS. However, Apple continues to work with Madge Networks to ensure the availability of 3rd party Token Ring products that are compatible with the latest Apple hardware and the Mac OS operating system. Madge Token Ring products are available through authorized Madge resellers. For more information, see the Madge Web site at http://www.madge.com.

Known limitations and other issues

- Open Transport 2.0.3 has been qualified with Mac OS 8.6 only, using Open Transport 2.0.3 with any other version of the Mac OS may result in anomalous behavior.
- To make sure your computer is "pingable" at all times, turn off the "Load only when needed" option in the TCP/IP control panel, and restart your computer. (To turn off "Load only when needed," open the TCP/IP control panel, choose User Mode from the Edit menu and select Advanced. Then click the Options button, and click the "Load only when needed" checkbox to remove the checkmark.)
- When TCP/IP is set to "Load only when needed," the first TCP/IP application opened will cause Open Transport to load into memory. Some older applications don't cause Open Transport to load, and then report errors similar to those encountered when MacTCP is not installed. If this is a problem, turn off "Load only when needed" and restart your computer. For instructions, see above.
- Generally, you should turn on the "Load only when needed" option in the TCP/IP control panel when using a modem. If TCP/IP is always loaded ("Load only when needed" is not checked), your modem may attempt to initiate a dialup connection at startup. Some MDEVs require more system heap memory than is available at startup, which may cause the computer to hang. Also, some Internet service providers charge by connect time, so you may be charged for the connection, even if you weren't using it.
- To make AppleTalk active or inactive, use the AppleTalk control panel or the AppleTalk control strip. Using the Chooser to make AppleTalk inactive may not completely deactivate AppleTalk.
- The TCP/IP control panel is able to obtain and utilize multiple gateway and name server addresses from DHCP and BootP servers. However, TCP/IP currently displays only the first address, and only in Basic user mode.
- You should only specify use of 802.3 framing in the TCP/IP control panel if you have been directed to do so by your network manager, or if you are sure that all other stations on your network segment, including your IP router(s), are also configured to use 802.3 and not Ethernet version 2.0 framing.
- Claris Emailer version 1.1 v3 or later and Claris Emailer Lite version 1.1 v4 or later is compatible with Open Transport 1.1.2 and later. Earlier versions of Claris Emailer may not be compatible with Open Transport's "Load only when needed" configuration option. If you experience a system crash 2-3 minutes after quitting Emailer, turn off the "Load only when needed" option. (Open the TCP/IP control panel and click the Options button, then click the "Load only when needed" checkbox to remove the check mark.)
- NFS/Share versions 1.4.4 or later are compatible with Open Transport. NFS/Share is now part of Intragy Access from Ascend http://www.ascend.com/.
- When using Netware Client version 5.11 configured for NetwareIP service, the first login may yield a Netware Configuration error message. To avoid this error, open the NetwareIP control panel and change the value under Domain SAP Server (DSS) Retry Attempts from 1 to 2. You can also change Open Transport TCP/IP control panel to always load TCP/IP into memory (open the TCP/IP control panel, click the Options button, and click the "Load only when needed" box to remove the check mark).
- eXodus 5.2.2 and later versions are compatible with Open Transport.
- If an Apple Remote Access (ARA) user is on a non-routed, extended (Ethernet) network, and there are devices on the local network with the same network number as devices on the remote network, the user won't be able to see the local devices. This issue can be fixed by installing a router. Another work around is to clear the PRAM on the ARA computer. (Hold down the Command, Option, and PR keys simultaneously while starting up the computer). Clearing PRAM causes the computer to start up with a new network number, which should not conflict with the remote network number.

PlainTalk: Using Speech Recognition 1.5.4

This article comprises the Read Me for PlainTalk version 1.5.4. This software was released by Apple 10 May1999 and is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Description
PlainTalk is a collection of software programs that let your Macintosh speak written text and respond to spoken commands. PlainTalk 1.5.4 includes English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition.

Requires

- Mac OS 8.6
- a Power Macintosh or Macintosh G3 computer
- a 16-bit microphone, such as the Apple PlainTalk microphone or the microphone built into some Apple audio-visual monitors

This article has been archived and is no longer updated by Apple.
Using the English Speech Recognition software and the proper hardware, your computer can respond to your spoken commands. English Speech Recognition includes the Speech Recognition extension and a utility program called Speakable Items.

This document explains how to set up and use Speech Recognition and the Speakable Items software. For more information, open Mac OS Help (in the Finder's Help menu) and choose the Speech topic.

The instructions in this document tell you:

- What you need to use this software
- How to install the software
- How to prepare the microphone and sound software on your Macintosh
- About the Speakable Items software
- How to solve common problems

What you need to use Speech Recognition 1.5.4

To use Speech Recognition 1.5.4 you need the following:

- a Power Macintosh or Macintosh G3 computer.
- system software version 8.6 or later.
  Note: The Read Me file included with Mac OS 8.6 Update mistakenly states that Speech Recognition 1.5.4 requires Mac OS 8.5.
- a 16-bit microphone, such as the Apple PlainTalk microphone or the microphone built into some Apple audio-visual monitors.

Installing the Speech Recognition software

You may want to print these instructions before you start, because you won't be able to view them on screen during the procedure.

You install the Speech Recognition software as follows:

If you are installing Mac OS and would like to include Speech Recognition with the standard installation:

1. Double-click on the "MacOS Install" icon on your system software CD.
2. At the screen that shows "Click Start to Install MacOS..." click on the "Customize" button at the bottom of the window.
3. Select the "English Speech Recognition"check box.
4. Click "Install." The speech recognition software will be installed with the rest of the MacOS.

If you are installing Speech Recognition alone:

1. Click on the "MacOS Install" icon on your system software CD.
2. Indicate you are installing new software when asked.
3. Select the "English Speech Recognition"check box.
4. Click "Install." The speech recognition software will be installed.
5. When you see a message that installation was successful, click Restart.

The first time you turn on Speakable Items, you will see two windows on the screen at once: the feedback window and an Introduction to Speech

tutorial window.

Note: If you see a message telling you the standard microphone is not selected, click OK, turn Speakable Items off in the Speech control panel, and check your sound input settings as described in "Preparing the Sound Software," later in this document.

Note to iMac users: If you're using the iMac's built-in microphone, you will see a message telling you that your recognition accuracy might not be optimal. For best results, connect an external PlainTalk microphone to your iMac.

Preparing the microphone

If you don't have an audio-visual monitor with a built-in microphone, you need to connect an Apple PlainTalk Microphone (or equivalent) to your computer. Position the microphone as follows:

- Center the microphone on top of your monitor (if possible), with the microphone's Apple icon facing you.
- Make sure that you're between 1 and 3 feet in front of the microphone when you're giving spoken commands.
- Adjust the microphone cord so it is not looped around itself or other cords.

Preparing the sound software

For your microphone to work, you need to select it as the sound input source in the Monitors & Sound control panel.

1. Open the Monitors & Sound control panel (in the Control Panels submenu in the Apple menu).
2. Click the Sound button.
3. Make sure the Sound Monitoring Source is set to the microphone you are using (External Mic or Built-in Mic).
4. Close the Monitors & Sound control panel.

About the Speakable Items software

Speakable Items is a utility that lets you speak commands to your computer. You can tell your computer to do things such as close windows, tell what time it is, open applications and folders, or tell a joke. Speakable Items comes with a set of commands that the computer already understands, and allows you to create new speakable items quickly and easily.

There are three components with which you interact with the Speakable Items utility: the Speech control panel, the feedback window, and the Speakable Items folder.

- You use the Speech control panel to turn Speakable Items on and off, and to specify how the computer listens and how it gives you feedback.
- You use the feedback window to check whether the computer is listening and how it has responded to your command. The feedback window is open whenever Speakable Items is turned on.
- The Speakable Items folder in the Apple menu contains all the items whose names the computer can recognize. When you say the name of an item in this folder, the computer acts as if you double-clicked its icon. You can add to or delete the items in this folder, or change their names.

For instructions on using Speakable Items, search on the term "Speakable Items" in Mac OS Help (in the Finder's Help menu).

Troubleshooting

If you run out of memory while using speech recognition

- If you see a message that Speech Recognition is having trouble due to lack of memory, save all your open documents and quit the application programs you have open.
- Use the Speech control panel to choose a voice that requires less memory, or turn off voice feedback altogether. The voices with "high quality" in their names use the most memory. "Fred" uses the least. To see how much memory a voice needs, look at the size of the voice files in the Voices folder in the Extensions folder.
- Use the Memory control panel to turn on virtual memory. (With virtual memory on, voices may be slightly distorted and, with some programs, speech performance may decrease.)
- Install more memory in your computer. If you are using System 8.5 or later on a Power Macintosh with English Text-to-Speech and English Speech Recognition installed, then it is recommended that your computer have at least 32 megabytes of RAM.

If you have problems using other applications

A few applications may interfere with Speech Recognition. For example, Speech Recognition may not work with programs that use the microphone themselves, such as software that lets you record and edit sound. Turn off Speakable Items (see above) and any other Speech

Recognition applications that you may be running when using these programs.

If the computer isn't recognizing your commands correctly

- If you are using your computer's built-in microphone, it may not have sufficient audio quality to work well with Apple's Speech Recognition software. This is most likely to happen on computers where the monitor, microphone, and computer are combined, and is more problematic on the iMac because of the noise coming from the internal fan. If you are experiencing problems with the accuracy of Speech Recognition, you should connect an Apple PlainTalk microphone to your computer.
- If you consistently experience problems in recognizing a particular Speakable Item (in the Speakable Items folder), try renaming the item. The way in which individuals pronounce and emphasize certain words can affect recognition accuracy.

Mac OS 8.6: Late-Breaking Tips

This document contains information about Mac OS 8.6 that was not included in the documentation with the software.
This article has been archived and is no longer updated by Apple.

Mac OS 8.6 and Mac OS X Server's NetBoot Server

If you are using Mac OS X Server's NetBoot Server, use NetBoot Desktop Admin 1.1 application to update to Mac OS 8.6. For complete information, please see the following article:

Article 60363: "**Mac OS X Server: Updating The NetBoot HD.img to Mac OS 8.6**."

Mac OS 8.6 and Mac OS X Server's MacOS.app

An incompatibility between MacOS.app and Mac OS 8.6 has been found. This can result in MacOS.app becoming unstable when quitting a Mac OS application. For complete information, please see the following article:

Article 60362: "**Mac OS X Server: Mac OS 8.6 and MacOS.app**."

Mac OS 8.6 Installer and Special Folder Deletions

When installing or updating to Mac OS 8.6, the installer deletes certain obsoleted folders. This may affect you if you store your documents in these folders. For complete information, please see the following article:

Article 60383: "**Mac OS 8.6: Folders That Are Removed**"

Configure TCP/IP if printing using LPR

If you are attempting to print using LPR and you do not have TCP/IP properly configured, you may experience a crash. The solution is to properly configure TCP/IP. For complete information, please see the following article:

Article 24907: "**Mac OS 8.6: Hang When Printing To An LPR Printer.**"

Searching the Knowledge Base

To find all Knowledge Base articles on Mac OS 8.6, search on keyword "kmos86".

Mac OS X Server: NetBoot Client Firmware Updates

When trying to run the iMac Firmware Update to resolve the issue documented in article 60219: "**Mac OS X Server: iMac Firmware Update Needed For NetBoot.**"

The computer restarts without incident, and there is no visual indication that the firmware has been updated. However, the error stating that the firmware must be updated continues to appear.
This article has been archived and is no longer updated by Apple.
When the iMac Firmware Update application runs, it copies a file to the Startup Items folder in the iMac computer's System Folder. If the iMac is NetBooted when the updater application is run, it is not copied to the iMac computer's local hard disk, but instead to the System Folder "shadow" image residing on the NetBoot Server. Upon restart, the iMac uses the unmodified System Folder on the NetBoot HD.img. The file that should be in the Startup Items folder is not there, and the iMac computer's Firmware is not updated.

In order to run any Firmware update on an iMac or other NetBootable computer, you must first start up the computer from the internal hard disk, run the update, and restart from the internal hard disk.

Note: The issue described in this article may also apply to other CPU-specific firmware updates.

Mac OS X Server: Which Networking Protocol Is Used?

This article tells which networking protocol Mac OS X Server uses.

This article has been archived and is no longer updated by Apple.
The native networking protocol for Mac OS X Server is TCP/IP, based on the robust BSD TCP/IP stack used in much of the industry.

All the services in Mac OS X Server are tuned to deliver optimum performance over TCP/IP. AppleTalk is supported for some services for use with legacy clients, and to allow Macintosh systems to easily find the server. However, the server is not intended for use in AppleTalk-only networks, or to support large numbers of AppleTalk clients using Apple file services.

Final Cut Pro 1.0: No Video While Editing to Tape

It is possible when attempting to use Final Cut Pro's Edit To Tape command, that clicking Assemble properly rewinds the tape to the specified "in point" and the deck begins recording. However, it either records no video or it immediately stops recording and says to "Check DV-Input".
This article has been archived and is no longer updated by Apple.
If Edit To Tape is not outputting any video, yet Device Control does work properly, then the issue is most likely that you need to specify the Video Output target in Final Cut Pro's preferences. To do this, open Final Cut Pro's preferences window and click the General tab. In the pull down menu labeled "View External Video Using" choose your recording device. For example, if you are outputting to a DV Camera, you would select "Apple FireWire..."

Final Cut Pro preferences

Helpful Notes

- If your recording device is not connected to your computer, it will most likely not show up as an option in this pull down menu. You must first connect your recording device to your Macintosh and then specify it as the video output target.
- Checking the "Mirror on desktop during Print to Video" may cause output to be jerky. If you are experiencing dropped frames when editing to tape, make sure this option is not selected.
- For most purposes, when you are simply editing your video, set the "View External Video" option to "None". That way during the editing process, video is being output only to your monitor and not your recording device

QuickTime: How To Get The Latest Release

This article provides information on obtaining the latest release of QuickTime software.
This article has been archived and is no longer updated by Apple.
Apple may periodically post updates to QuickTime. There are three ways to obtain these updates, depending on what version you currently have installed.

If You Have Installed Any Version Of QuickTime 4

If you have already installed any version of QuickTime 4 since the initial Public Beta release, simply open your QuickTime Folder and run the QuickTime Updater application program. It automatically checks the server, then downloads and installs any pieces that have been updated.

While in the QuickTime Player Application, open the Help menu and choose "Check for QuickTime Updates." Make sure you have an active Internet connection before you check for updates.

If You Have Not Installed Any Version Of QuickTime 4

If you are running any version of QuickTime prior to QuickTime 4, you must go to **http://www.apple.com/quicktime** where you can download and run the latest QuickTime installer. Specific computer compatibility information is posted on the Web site.

AppleScript 1.3.7: Read Me

About AppleScript CD ROM Extras
This article has been archived and is no longer updated by Apple.
To aid you in using and learning AppleScript, we've included a script menu and example scripts in the AppleScript CD ROM Extras folder.

For more information about AppleScript, please use the online help system. To access AppleScript Help, switch to the desktop, choose Help Center from the Help menu, and then click the AppleScript Help link.

More information, examples, and tutorials are also available from the AppleScript website at:
http://www.apple.com/applescript/

OSA Menu

OSA Menu is a system extension written by Leonard Rosenthol which places a script scroll icon at the top right of the menu bar. When the scroll icon is clicked it will display a list of available scripts, including those used by the currently active application. Selecting a menu item will run the chosen script.

OSA Menu is not an Apple product and Apple makes no guarantees as to its use. Please read the documentation in the OSA Menu Installer for instructions on its installation, use, and for information about technical support issues.

iDo Script Scheduler

Script Scheduler, from Sophisticated Circuits, Inc., lets you automatically run AppleScripts at any time you choose. You can use it to make your Macintosh perform tasks such as downloading e-mail every morning, or backing up your important data when you're not at the computer. You can use Script Scheduler to create multiple types of repeating "events". Each event can run any chosen AppleScript, and it can pass a line of parameters when the script is run. It is especially useful in systems which run unattended, such as servers, store demos and and information kiosks.

Example Scripts

Included in the More Sample Scripts folder are the following script collections, designed for use with OSA menu.

To install these extra scripts:

1. Locate and open the Scripts folder in the System folder
2. Place the Universal Scripts folder, the Finder Scripts folder, and the Script Editor Scripts folder in the Scripts folder in the System folder.
3. Close the Scripts folder and the System folder.

Once placed into the Scripts folder, the example scripts will be accessible from the OSA Scripts menu.

The following is a brief listing and description of the included scripts.

Universal Scripts
Located on the upper section of the script menu, these scripts will be available from within any application.

Open Folder... This script will present a choose folder dialog from which you can select a folder to open on the desktop.

Unmount/Eject All Disks This script will attempt to unmount and eject all non-local volumes.

Finder Scripts

Add Prefix/Suffix to Files, Add Prefix/Suffix to Folders
These scripts can be used to add a prefix or suffix to the beginning or end of file or folder names. For example, you could choose to add .TXT to the end of every file in a folder of text files.

Change Case of All Names
This script can be used to change the case of every file name in a specified folder. For example, the file name: AppleScript Read Me could be converted to either upper case: APPLESCRIPT READ ME, or lower case: applescript read me.

Info for Selected Items
This script will display information about the selected files in the Finder. Information, including: size, file type, and creator code will be displayed for each selected item via successive dialogs.

Replace Text in Item Names
This script can be used to replace specified text in item names. For example: the text "image" can be replaced in all file names with "img" as in the file name: TEST IMAGE 1 would become: TEST IMG 1

Size of Finder Selection
This script will display the combined size of all the selected items in the Finder.

Trim File Names
This script can be used to trim text from the beginning or end of every file name in a folder. For example: you could choose to trim ".TIF" from every file name as in the file name: IMAGE1.TIF would be renamed to: IMAGE1

Script Editor Scripts

These scripts are a collection of sub-routines addressing common AppleScript tasks. When one of these script is run, a sub-routine is placed on the clipboard ready for you to paste into your script. Every script is editable and contains a description and example use within the script.

ASCII Sort
Change Case of Text
Convert Number to Text
Date Slug
FilePath - Extract File Name
FilePath - Parent Fldr Name
FilePath - Parent Fldr Path
Name Item
Read File
Return High/Low From List
Round - Convert - Truncate
Time Slug
Write to File

More Folder Actions Scripts

The scripts in the More Folder Actions Scripts folder are for use with the new Folder Actions feature of System 8.5. Place the individual scripts contained in the More Folder Actions Scripts folder into the Folder Actions folder located in the Scripts folder in the System folder. Please refer to the Online Help System for information about using Folder Actions.

add - add to activity log
This Folder Action script will create a log file on the desktop containing information about the items placed into the attached folder.

add - match parent label
This Folder Action script will change the label of every added item to match the label of the attached folder.

summarize added text files
This Folder Action script will read every added text file and summarize its contents in three sentences. You can edit the script to change its parameters including the number of sentences used in the summary.

Mac OS X Server: Mac OS 8.6 and MacOS.app

This article discusses compatibility between Mac OS 8.6 and MacOS.app.

This article has been archived and is no longer updated by Apple.
Mac OS 8.6 is compatible with MacOS.app with Mac OS X Server 1.0-2, which is Mac OS X Server with the Mac OS X Server Update 1.0-2 applied. This can be verified by checking the console window in Workspace. The first line should be "Software Version Mac OS X Server+Mac OS X Server 1.0-2 Patch (Hera1O9+Loki2G1)."

Mac OS 8.6 is not compatible with previous versions of MacOS.app.
Published Date: Feb 19, 2012

Mac OS X Server: Updating The NetBoot HD.img to Mac OS 8.6

This article tells how to update the NetBoot HD.img to Mac OS 8.6 for use with Mac OS X Server's NetBoot Server and the benefits of doing so.
This article has been archived and is no longer updated by Apple.
The Mac OS 8.6 Update should be applied to the NetBoot HD.img with the NetBoot Desktop Admin 1.1 application. Please note that the NetBoot Desktop Admin must be updated to version 1.1 available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

A clean installation of Mac OS 8.6 is not recommended. A clean installation requires the NetBoot HD.img to be resized. Use the update install instead. The Mac OS 8.6 Update install is also available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Changes made to the version of the Mac OS ROM file in Mac OS 8.6 greatly reduce the size of NetBoot "Shadow" files resident on the NetBoot Server from roughly 230 Mbytes to approximately 4 Mbytes. When running the NetBoot Desktop Admin application it is not necessary to manually update the Mac OS ROM file located in the "Shared Images" folder. The NetBoot Desktop Admin application checks for a modified Mac OS ROM in the NetBoot HD.img and update the file in the "Shared Images" folder automatically as necessary. It is necessary to update the NetBoot HD.img to Mac OS 8.6 in order to properly NetBoot PowerBook G3 Series (Bronze keyboard) computers. For more information, refer to article 58346: "**PowerBook G3 Series (Bronze keyboard): NetBooting With Mac OS 8.5.1 Not Supported.**"

Similar more generic instructions than the following are also available from the "About NetBoot Desktop Admin" Read Me that accompanies the NetBoot Desktop Admin application:

Installation Instructions

To install Mac OS 8.6 or other System Software updates to the NetBoot HD disk images, you need to log on to a NetBoot client computer, connect to the NetBoot server volume, and open the NetBoot Desktop Admin program several times. Your changes are not available to you or other users until after the NetBoot client computer restarts the last time.

Before you start, you need the following information:

- Name and password for a Global Administrator who belongs to the System Access workgroup.
- Name and password of a user with read and write access privileges to the NetBoot server volume (for example, the Administrator of the Mac OS X Server).

1. Log on to a NetBoot client computer as a Global Administrator who belongs to the System Access workgroup.

2. Open the NetBoot Desktop Admin application and log on to the server volume as a user with read and write access privileges (for example, the Administrator of the Mac OS X Server).

The application is installed originally in the NetBoot Desktop Admin folder, which is in the Admin folder on the NetBoot server.

3. Click Make Private Copy.

NetBoot Desktop Admin creates copies of the disk images which you can change. This may take several minutes and you should not interrupt the process. When it finishes, your NetBoot client computer restarts automatically.

IMPORTANT Because the copies of the disk images are associated with the NetBoot client computer you used to create them, you must make the changes to the images using the same computer. If you change computers, you cannot see the changes you have made and your changes are not available to users. In addition, you increase the risk of unauthorized persons making changes to the disk images.

4. Log on to the NetBoot client computer again as the same user and install the Mac OS 8.6 Update on the NetBoot HD image. The Mac OS 8.6 default installation places newer versions of certain files on the NetBoot HD disk image, but does not remove the older versions which are on the Applications HD disk image. After installing Mac OS 8.6, you need to move the newer versions from the NetBoot HD to the Applications HD, and delete the older versions. It may also be necessary to update any aliases to those items. Certain items such as Apple Secure Compression are not contained within the Apple Extras folder installed by updating to Mac OS 8.6. Extra care should be taken to not overwrite these items when updating the Applications HD image.

5. Be sure there aren't any files in the Trash that you want to save. (The Trash is emptied automatically after the next step.)

Note: If you cannot empty the Trash because it contains files that are in use, you may need to restart the computer and log on to the NetBoot client computer again.

6. Open the NetBoot Desktop Admin application and log on to the server, then click Save or Discard. The computer restarts automatically.

If you need to make other changes, you can click Quit and return to step 4.

7. Log on to the NetBoot client computer again, then open the NetBoot Desktop Admin application and log on to the server.

If you want to keep a backup copy of the old disk image, leave the "Keep previous disks as backup" option selected. Backup copies are stored in the Backup Images folder in the Shared Images folder on the NetBoot server.

8. If you clicked Save in step 6, click Restart. Otherwise, click OK.

If you click Restart, NetBoot Desktop Admin saves your changes, deletes the copies of the disk images, then restarts the computer. Changes are available the next time a NetBoot client computer restarts. If you click OK, NetBoot Desktop Admin deletes the copies of disk images.

Published Date: Feb 20, 2012

Mac OS 8.6: Language Kit Update

I noticed that the Language Kit Update contained in CD Extras on the Mac OS 8.6 CD refers to Mac OS 8.5. Can I use this update with Mac OS 8.6?
This article has been archived and is no longer updated by Apple.
The Language Kit Update contained on the Mac OS 8.6 CD within CD Extras is applicable to Mac OS 8.6 although the Read Me file notes that it is for Mac OS 8.5.

If no Apple Language Kits are installed, the update is unneeded. If Language Kits are installed, then the Language Kit Update should be run to update files for Mac OS 8.6 compatibility. Despite which Kit(s) is installed, the updater deletes outdated components and installs or updates files as necessary.

For more information, see the following Tech Info Library Articles:

Article 24799: "**Language Kit Updater For Mac OS 8.5: Read Me**"
Article 60283: "**Mac OS 8.6: About Mac OS 8.6 Update**"

Note: The Language Kit updater is not included with the Mac OS 8.6 Update download. However, the original Mac OS 8.5 Installation or Restore CD contains the Language Kit Updater necessary for use with Mac OS 8.6 as well.

AppleTalk Options Control Panel Read Me

This article comprises the Read Me for AppleTalk Options Control Panel, part of Open Transport Extras version 2.0.3. This software was released by Apple 10 May 1999 and is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Requires
Mac OS 8.6
This article has been archived and is no longer updated by Apple.
Important Do not use the AppleTalk Options control panel unless instructed to do so by your network administrator. AppleTalk Options control panel is an unsupported utility developed by Apple Computer, Inc. and requires Open Transport 1.1.1 or later.

About the AppleTalk Options feature
This feature allows a user to suppress unwanted router-related alerts.

Why suppress router-related alerts?
Some Ethernet-ISDN bridges used for remote LAN-to-LAN connectivity drop the connection when there is no active data transfer, and dial on demand when there is information to be transferred. If a user's local network does not include an AppleTalk router, a message appears each time the connection is dropped. Use the AppleTalk Options control panel to prevent the alerts from being displayed.

Disabling the router-related alerts feature

To install and use the AppleTalk Options control panel, follow these steps:

1. Drop the AppleTalk Options control panel onto a closed System Folder.
2. Open the Control Panels folder from the Apple menu.
3. Open the AppleTalk Options control panel.
4. To eliminate unwanted alerts, click the "Suppress router-related alerts" checkbox to put a check in it.
5. Close the AppleTalk Options control panel.
6. Either turn AppleTalk off and on, or reboot your system in order for your setting to take effect.

Re-enabling the router-related alerts feature

To revert to the normal Open Transport mode, uncheck the "Suppress router-related alerts" check box in the control panel and reboot your system.

Important: Simply removing the control panel from your Control Panels folder does not re-enable the alerts. You must deselect the "Suppress router-related alerts" option in the control panel.

Open Transport/SNMP Read Me

This article comprises the Read Me for Open Transport/SNMP, part of Open Transport Extras version 2.0.3. This software was released by Apple 10 May 1999 and is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Requires
Mac OS 8.6
This article has been archived and is no longer updated by Apple.

Contents

- Introduction
- Requirements
- Installation Instructions
- SNMP Implementation
- SNMP Transports
- Third Party Consoles

Introduction

Open Transport/SNMP provides an implementation of the Simple Network Management Protocol (SNMP) standard. SNMP can be used to display detailed technical information about the inner workings of Open Transport/TCP and Open Transport/AppleTalk which can assist when advanced troubleshooting of the network protocol stacks, or performance monitoring of Open Transport is required. It can also be used to retrieve information about a Mac OS system across an AppleTalk or TCP/IP network using a standards-based SNMP Management Console application. Much of the Mac OS information is also available locally through the Apple System Profiler application.

A Management Information Base, or "MIB", is a formal description of a set of network objects that can be managed using the Simple Network Management Protocol (SNMP). Included with OT/SNMP is support for three MIBs. One provides statistical information about the Open Transport/TCP protocol stack. The second provides statistical information about the Open Transport/AppleTalk stack. The third provides information about Mac OS.

OT/SNMP can be configured with the SNMP Admin application, which is found on the Mac OS 8.6 installation CD, in the CD Extras folder, in the folder called Network Extras, in the Open Transport folder. (Mac OS 8.6 installation CD/CD Extras/Network Extras/Open Transport/SNMP Administrator)

The default configuration only enables access to TCP/IP statistics from a management console on the network. Using the SNMP Admin application a network manager can allow additional information about a Macintosh to be collected using a SNMP Management Console.

Requirements

Minimum system requirements for this release:

- Any Power Macintosh system
- Any 68K Macintosh system with at least an 68030 processor (a math co-processor is not required)
- Mac OS 7.5.5 or newer
- Open Transport 1.1.1 or newer
- At least 2 mb of free space on the startup disk
- 16 mb of physical RAM (OT/SNMP is compatible with Virtual Memory and RamDoubler)

Installation Instructions

Mac OS 8.6

OT/SNMP is an optional component with Mac OS 8.5, and is not installed by default. To install OT/SNMP, select the "Customize" button from within the "Install Software" screen of the Mac OS 8.6 Installer.

Within the "Custom Installation and Removal" screen of the installer, place the pointer on the "Recommended Installation" button to the immediate right of the Mac OS 8.6 title in the "Software Components" list. Depress the mouse button, and choose "Customized Installation" from the pop-up menu.

From the list of networking features that appears, toggle the "Networking & Connectivity" triangle control, and from the list that appears click the check box next to "SNMP" and then click Ok. When finished, click the start button, and OT/SNMP will be installed.

Older releases of Mac OS

Copy the SNMP Administrator folder from the Mac OS 8.6 installation to your hard drive. The SNMP Administrator application can reside anywhere on your hard disk.

Drag the "Open Transport SNMP" and "OpenTptSNMPLib" extensions into the Extensions folder.

AppleTalk must be active and TCP/IP should be configured so the "load only when needed" checkbox is not checked. To change this TCP/IP setting, select "User Mode" under the Edit menu and enable Advanced or Administrator user mode. Then press the options button that is displayed in the TCP/IP Control Panel window.

SNMP Implementation

OT/SNMP implements version 1 of SNMP as defined in IETF STD 15 (RFC 1157): "A Simple Network Management Protocol (SNMP)".

The following MIB groups, as defined in IETF STD 17 (RFC 1213) "Management Information Base for Network Management of TCP/IP-based internets: MIB-II", are supported:

- System
- Interfaces
- IP
- ICMP
- TCP
- UDP
- SNMP

Note: statistics for the Interfaces group depend on network drivers for SNMP data. If a driver is not DLPI-based or does not support the DLPI DL_GET_STATISTICS_REQ operation, SNMP counters for the interfaces it supports are not available.

Mapping of interface numbers between different tables (e.g. ifIndex and ipRouteIfIndex) is not implemented.

The following MIB-II groups are NOT implemented in this release:

- Address Translation (deprecated)
- EGP
- Transmission

The following MIB groups defined in RFC 1742 "AppleTalk Management Information Base II" are implemented:

- LLAP
- AARP
- DDP
- RTMP Stub
- ZIP End Node
- NBP
- ATEcho
- ATP
- PAP
- ASP
- ADSP
- Per Port Counters

In addition, there is support for these groups defined in "Mac OS Management Information Base":

- System
- Software
- Hardware

Note: most variables defined as having read/write access are read-only in this release.

SNMP Transports

This release implements SNMP over UDP as defined in IETF STD 15 (RFC 1157) Section 4, and SNMP over DDP as defined in RFC 1419 "SNMP over AppleTalk".

Transports are loaded only when their associated protocol stacks are active and loaded into memory. Using the "Options" dialog from the TCP/IP control panel interface select the "Active" radio button and uncheck the "Load only when needed" checkbox. Using the "Options" dialog from the AppleTalk control panel select the "Active" radio button.

Third Party Consoles

Open Transport/SNMP includes text files that define the MIB variables implemented in the AppleTalk and Mac OS MIBs. These can be imported into some third party SNMP Management Console applications. See your console's documentation for more information about importing new MIBs.

To date, Open Transport SNMP has been tested with the following SNMP Management Console applications:

- Dartmouth College SNMP Watcher URL: http://www.dartware.com
- Hewett Packard OpenView URL: http://www.hp.com
- Neon Software LanSurveyor URL: http://www.neon.com

Disk Copy 6.3.3: Fails To Open From Image

After downloading version 6.3.3 of Disk Copy and mounting the image on the desktop, attempting to open the Disk Copy application fails with the message: "Disk Copy could not update the disk image driver. Please unmount all disk images and try again."

This article has been archived and is no longer updated by Apple.

Disk Copy was not intended to be opened from within an image mounted on the desktop because it uses the code base used to mount images on the desktop. That is, to avoid this situation, open the .smi file to mount the image on your desktop, then copy Disk Copy to your hard disk. Before using Disk Copy, drag any disk images mounted on the desktop into the Trash or restart. Disk Copy should then work correctly.

AppleWorks: "Default location required for this install could not be found" Alert

If AppleWorks components are moved from their default locations, AppleWorks updater software may be unable to perform an update.
This article has been archived and is no longer updated by Apple.

Symptom

The AppleWorks updater software halts, and an alert box appears with this message:

> "The default location required for this install could not be found. The install will be canceled."

Products affected

- ClarisWorks 5
- AppleWorks 5
- AppleWorks 6

Solution

Reinstall the software from the original disk(s) and then perform the update.

The symptom described above can also occur for the following reasons:

- If an AppleWorks component has been moved from its default location.
- If you are attempting to update to AppleWorks 5.0.3 and the update has already been performed.
- If you are attempting to update AppleWorks using an updater in a language that does not match the installed version of AppleWorks.

Apple Remote Access Server 3.0.2: Read Me

This article comprises the Read Me for Apple Remote Access (ARA) Server version 3.0.2. This software was released by Apple on 01 June 1999 and is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Description
This software will update Apple Remote Access Server Software to version 3.0.2. The ARA 3.0.2 Server Updater fixes the following issues: AppleTalk Network Access Interruption, a G3 Sleep Issue, and Incorrect Status Display. Apple recommends that customers use this utility to update the ARA 3.0 Server.

Requires
Apple Remote Access Server 3.0
This article has been archived and is no longer updated by Apple.

About the Update for ARA 3.0.2 Server

What the Updater Does

The ARA 3.0.2 Server Updater fixes the issues described below. Apple recommends that customers use this utility to update the ARA 3.0 Server.

Note: If the client version of Apple Remote Access (version 3.0 or later) is installed, follow the directions outlined in Knowledge Base article 30830: "**Mac OS 8.5: Installing ARA Personal Server 3.0.**" to remove the client software prior to installing Apple Remote Access Server 3.0.

AppleTalk Network Access Interruption

On certain networks a Macintosh connected to a Local Area Network (LAN) will periodically get a message stating "Access to your AppleTalk Network has been interrupted." In some cases AppleTalk services become available again, in other cases the AppleTalk network does not become available again.

For additional detailed information, please refer to Knowledge Base article 24549: "**ARA 3.0: 'AppleTalk Network Not Available' Message.**"

G3 Sleep Issue

This applies only to Macintosh computers that use the G3 processor: If the computer has been in "Sleep" mode prior to attempting to make an ARA connection, the computer will not successfully connect to a remote access server using ARAP. The modem will dial and establish a connection but the connection never gets beyond the status message which states "Starting ARAP..." The connection will eventually time out with an alert. The connection attempt can also be terminated using the Cancel button.

Once the Macintosh has been put into sleep mode, it must be restarted in order to make ARAP connections. This does not occur with ARA 2.1.

Connections made via PPP will work whether the Macintosh has been put to sleep or not.

Incorrect Status Display

Several minor issues that would cause Remote Access status to display incorrect status information have been fixed. The most common symptom of these issues is that the status display would not get beyond the message, "Starting Network Protocols."

For additional information, please refer to Knowledge Base article 22070: "**ARA 3.0: 'Starting Network Protocols' Status Does Not Change.**"

Updating the ARA 3.0 Server

To update an ARA 3.0 Server, double click on the Update for ARA 3.0.2 Server icon. The updater will search for the appropriate files to update and list them in a window. Select either the file "OpenTpt Remote Access" or "OpenTpt Remote Access 68K" that resides in the Extensions folder inside the active System Folder and click on the Update button. If both the PPC and 68K files are present, the updater must be run twice, once for each file. After the update is complete the following message will be displayed: "The file has been successfully updated." The final step is to quit the updater utility and restart the Macintosh.

In order to verify whether or not the ARA 3.0 Server has already been updated, open the Remote Access control panel and Get Info (using the Get Info command in the File menu). An updated server will display "Remote Access: 3.0.2" Any Remote Access files that are placed in the Trash by the updater can be deleted.

AppleShare IP 6.2: Read Me

This article comprises the Read Me for AppleShare IP version 6.2. This software was released by Apple on 01 June 1999 and is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.
This article has been archived and is no longer updated by Apple.

Description

AppleShare IP 6.2 is the an update to AppleShare IP 6 and builds on the existing AppleShare IP product by continuing to provide the complete suite of LAN and Internet services, including Web, File, Mail and Print services. New for version 6.2 is full compatibility with Mac OS 8.6, allowing server administrators to take advantage of improvements in the Mac OS. AppleShare IP 6.2 now provides the ability to maintain a centralized user database on one server, and utilize that database on up to ten AppleShare IP 6.2 servers on the network. AppleShare IP 6.2 also provides default home directory support, Sherlock web server searching, and many other feature enhancements. In addition, AppleShare IP 6.2 provides many bug fixes and general performance improvements. AppleShare IP continues to be fully compatible with Macintosh and Windows clients. AppleShare IP retains its traditional ease of use with a single administration console, making it simple to manage AppleShare users, groups, passwords and security.

Requires

- Any Power Macintosh computer, iMac, or Macintosh Server with a G3, 604e, 604, or 601 microprocessor, or a 6500 series computer with a 603e microprocessor.
- Any English Mac OS 8.6
- AppleShare IP Server 6.x

Contents

- Notes About AppleShare IP 6.2

Introduction

AppleShare IP 6.2 is an update to AppleShare IP 6 and builds on the existing AppleShare IP product by continuing to provide the complete suite of LAN and Internet services, including Web, File, Mail and Print services. New for version 6.2 is full compatibility with Mac OS 8.6, allowing server administrators to take advantage of improvements in the Mac OS. AppleShare IP 6.2 now provides the ability to maintain a centralized user database on one server, and utilize that database on up to ten AppleShare IP 6.2 servers on the network. AppleShare IP 6.2 also provides default home directory support, Sherlock web server searching, and many other feature enhancements. In addition, AppleShare IP 6.2 provides many bug fixes and general performance improvements. AppleShare IP continues to be fully compatible with Macintosh and Windows clients. AppleShare IP retains its traditional ease of use with a single administration console, making it simple to manage AppleShare users, groups, passwords and security.

Installation and Documentation

Complete installation instructions are contained in the Getting Started manual. Additional help can also be found in the AppleShare Client 3.8 User's Manual, and in the AppleShare IP Help and Remote Help, all of which are included with your AppleShare IP 6.2 software.

Please note: in the Software License Agreement window within the installer, you will need to click the "Continue" button to proceed to the window where you can Agree or Disagree to the license terms and conditions.

Requirements for Running AppleShare IP 6.2

Power Macintosh computers running AppleShare IP 6.2 Server

- CPU: Any Power Macintosh computer, iMac, or Macintosh Server with a G3, 604e, 604, or 601 microprocessor, or a 6500 series computer with a 603e microprocessor.
- RAM: 64 MB of memory with virtual memory turned on; 80 MB with virtual memory turned off. More memory may be needed if you are using one or more web server plug-ins.
- System Software: Mac OS 8.6 is required and is provided for use on the server as part of your AppleShare IP Server software.

Macintosh computers running AppleShare Client 3.8.3

- System Software: Mac OS 8.6 is recommended. The minimum requirement is Mac OS 7.6 or later.
- AppleShare Client 3.5 or later is required for connecting to an AppleShare IP 6 server. However, Apple strongly recommends that you upgrade your client Macintosh computers to Mac OS 8.1 or later and AppleShare Client 3.8 or later.

Support

Telephone Support

In the United States, if you have questions about AppleShare IP 6.2 that are not answered by the Getting Started manual or AppleShare IP Help or Remote Help, call the Apple Assistance Center at 1-800-APL-CARE (1-800-275-2273) during telephone support hours (Monday through Friday, 6 a.m. to 6 p.m. Pacific time). When prompted, enter the support access number provided on the back of your Apple Support Card and follow the instructions.

If you are located outside of the United States, refer to the support information that came with your AppleShare IP 6.2 software for instructions.

Web Sites

If you have an Internet connection, check the Apple Support Web site at http://www.apple.com/support/. For recent downloads, refer to the Apple Downloads page at http://www.apple.com/support/downloads/ and search AppleShare IP.

AppleShare IP Mailing List

To receive information about software updates, you are cordially invited to join the AppleShare IP mailing list. By joining the mailing list, you will also have the opportunity to share your experiences, questions, and comments with others using the software. Apple employees may monitor the list, but Apple does not guarantee that any questions directed to this list will be answered. For more information about joining the mailing list, see the AppleShare IP Web site at www.apple.com/appleshareip, and look for the heading "Feedback".

Notes About AppleShare IP 6.2

General

- If you purchase an Unlimited license upgrade, do not forget to increase the number of guest connections allowed in the Web & File Admin's Web & File Settings' General window. This setting is located under the Server menu.
- As a convenience, the AppleShare IP Installer changes the Energy Saver preference on your server to turn off the server monitor after 30 minutes. The Energy Saver control panel has 'Separate Timing for Display Sleep' set to 30 minutes.

Web & File Admin

In low memory situations, Web & File Admin may not work properly. If necessary, turn on Virtual Memory or quit other applications. In addition, make sure that you set aside enough memory in the AppleShare IP Cache panel for your other applications to launch, including Web & File Admin.
You should quit the Web & File Administration application when not making changes to the Admin application.

Registry

The AppleShare IP Registry will convert your Users & Groups file to run with AppleShare IP 6.0 and later the first time you reboot with AppleShare IP installed. Since this file will no longer work with Personal File Sharing after the conversion, a copy of the original file is placed in your Preferences folder. The file is named Users & Groups Data File Backup. The copy of the original file may be used if you decide to restore your computer to Personal File Sharing after de-installing AppleShare IP 6.0 and later.

Web & File Server

- If a computer that is running the Web & File Server crashes, check your hard disks by running Disk First Aid before you start the Web & File Server again. Disk First Aid is located in the Utilities folder on your MacOS CD ROM disc or within your utilities folder on your startup disk.
- The Adobe Acrobat(TM) Installer cannot be used while the Web & File Server is running. Be sure to install Adobe Acrobat before you start the Web & File Server.
- AppleShare IP 6.2 is not compatible with ARA Multiport Server software. You should not run them on the same computer.
- Under some circumstances you may not be able to install PC applications from Windows File Sharing Server. To perform net installations of applications that are partitioned on multiple floppy disks, create a folder 'X' and copy each disk as a separate subfolder. Then make the

parent folder 'X' a share point. From the client, connect to the share point and perform the installation.

- If you receive a message stating that error -30523 has occurred in a Sherlock client, verify that you do not get the same message on the server computer itself. If you do, then delete and rebuild the index on the server. If you do not, or if the client and server are not using the same localized version of Mac OS or are in different time zones, then upgrade client computers to Mac OS 8.6.
- AppleShare IP 6.2 may not behave correctly when used with Retrospect 4.1. Specifically, the server may not shut down or disconnect users when requested to do so by Retrospect. Contact Dantz for an update to Retrospect.
- If you decide to host multiple web sites using the Multi Domain Plugin, be sure to examine the "Plug-In Messages" file after you've started the web server. If the Multi Domain Plugin encountered any errors while reading your "Multi Domain Settings" file, it will write error information to the "Plug-In Messages" file, which is located in the AppleShare IP Preferences folder within the Preferences folder within the System Folder.
- Because of a driver issue, it is not possible to share PC-format ZIP(TM) disks. Mac OS format ZIP(TM) disks can be shared without difficulty.
- A known issue on Microsoft Windows 95 or 98 does not report a volume's total free space correctly. A share point for a volume that is 2GB or greater will show that 1.99GB free space and 0 user space. This is a cosmetic issue and should not affect the ability of Windows clients to use the share point.
- The AppleShare IP Web & File server may hang with virus protection installed. If you experience such behavior, try removing or disabling your virus protection software.
- The Upload plugin only uploads text files to the AppleShare IP web server; it does not "decode" binary files or applications that are uploaded. An ftp client can be used to upload other types of files to your web server folder.
- SMB connections may not be automatically disconnected with the idle timeout feature. To disconnect SMB connections, the Windows client has to log out or be manually disconnected by the AppleShare IP administrator.
- Some characters used in the name of a file or folder on the AppleShare IP server will not map correctly between Mac and Windows 98/NT 4.0 Workstations. In some cases, the character may show up as the incorrect character. In other cases, the client may receive the message: "The folder <path> does not exist." when attempting to open, rename, delete, or access a folder. Windows clients may not be able to delete files that contain certain characters. If you have Windows clients, some characters you should avoid using include: a (aacute), a (agrave), a (acirc), a (atilde), e (egrave), e (ecirc), S (sect).
- PowerPoint 97 for Windows requires Office 97 Service Release 2 (SR-2) in order for files to be opened correctly from AppleShare IP server by a Windows client.
- Automatic user directories are limited to 27 characters in length. In 6.2, user names are limited to 27 characters, but previously-existing names may be longer. If you wish to assign a user with a name longer than 27 characters access to an automatic user directory (home directory), you will need to shorten the name to 27 characters or fewer.

Shared Users & Groups

- Administrators should not make user and group changes on the Secondary server. User and group changes made on the Primary server will not go into effect until the Secondary server user connection expires.
- When sharing users and groups between servers, you will need to stop and restart the computer that is the Primary AppleShare IP server if its TCP/IP address is changed. In addition, you will need to reflect this change in the Secondary server(s) if its Primary server's address is entered by TCP/IP address. At Secondary server, go to the Web & File Admin's Web & File Server Settings' General window to make this change. This setting is located under the Server menu.
- If you share users and groups between many different computers, you may experience delays and performance bottlenecks, particularly with the "Download All" operation. Under some circumstances, the "Download All" operation may time out, and report a network error. If this should happen, try again later.
- To use the "Download All" feature of Shared Users & Groups, or to change the name of your Primary Shared Users & Groups in Web & File Admin, you must stop the Web & File server, or you will receive an error message. This is because user & group information that the Web & File Server requires may change as a result of performing these operations.
- The Apple Remote Access Server software will not automatically update its user account information when it is running on a Secondary AppleShare server. To configure or update user account information for a Remote Access Server, the server administrator must always enter or make changes to the ARA dial-in information at the Primary server, and then use the Download All command at the Secondary server to force these changes to be copied over to the Secondary server.

AppleShare Client 3.8.3

- If you are running Mac OS 8.5, the AppleShare client, and have virus protection installed (such as NAI's Virex 5.9 or Norton Anti-Virus 5.0), you may experience system hangs on client computers when connecting to an AppleShare server. If you experience such behavior, try removing or disabling your virus protection software.
- For additional items, please refer to the AppleShare Client Read Me.

Mail Server

- If you have exported users with mail attributes using AppleShare IP 6.0 or 6.1, be aware of a format change required to import users into AppleShare IP 6.2. There is now an extra column at the end of the mail attributes which contains the new "mail server account location" attribute. This value can be empty, but to import successfully, you will need to add at least a "blank" column (tab) before the end of the line.

- The AppleShare IP 6 Mail Server can not use previous versions of AppleShare IP 5.0.x mail Databases. If you have critical mail that you do not want to lose, you must download those messages from the AppleShare IP 5.0.x Mail Server before running AppleShare IP 6. Or if downloading mail is not an option, the AppleShare IP Mail Tool 6.2 can convert 5.0.x Mail Databases to AppleShare IP 6 Databases.
- It is not necessary to update the AppleShare IP 6.0 & 6.1 Mail Databases to 6.2 Mail Databases with the AppleShare IP Mail Tool, as this will be done automatically when launching the AppleShare IP Mail Server 6.2.

Print Server

- You must use the Chooser for creating client-side Desktop Printers for secure print queues. Do not use the Desktop Printer Utility to create your client-side Desktop Printers for secure print queues as it does not allow you to enter your account information, so your jobs will not be printed correctly.
- It is recommended that a queue only contain printers of the same model and type. Also, printer features present in the first printer attached, but not present in subsequent printers, may cause print errors when jobs are printed to one of the subsequent printers.
- The "Allow binary data" and "Allow color printing" options are only used with AppleTalk print queues.
- Some LPR clients do not support queue names that include spaces. Therefore, the AppleShare IP Print Server will also recognize the name up to the first space. For example, if the print queue name is 'Accounting Department', the queue name 'Accounting' can be used by an LPR client to print to the same queue.
- Windows and Windows NT printer drivers can only be used with secure print queues that don't require a password. There is currently no method for the Windows clients to enter their name and password for a print job.
- When printing to a secure print queue from a Windows client, no alert is posted on the client for a security failure. Check the Print Server log file for confirmation if a job fails to print.
- With secure printing activated, a Postscript file copied or sent from one client to another for printing may not work.
- When creating or renaming print queues from Remote Admin, the Print Admin application will not see the new queue names until the next time it is launched.
- Using the Apple Printer Utility to rename or change the IP address for a printer does not update the Print Server settings. Use the Print Server Admin to re-enter the new printer name and/or IP address for the associated print queue.
- Using the Apple Printer Utility with LaserWriter 8.6 or earlier will return a spurious "PostScript Error" if you attempt to get configuration information for secure print queues of the Print Server.
- The Apple LaserWriter 8500 cannot be "hidden" or "captured" by print servers when you have an IP Gateway address set on the printer. Please refer to article **24788** for details.
- The LaserWriter IIg with v1.0 ROMs cannot be hidden with the Print Server.

Web-based Remote Admin

- To use Internet Explorer as your Web browser, please set the Java preferences to use the "Apple MRJ" setting. Confirm that your computer is running Macintosh Runtime Java (MRJ) 2.0 or later by checking the version of the MRJLib contained in the MRJ Libraries subfolder of your Extensions folder. This release is incompatible with Internet Explorer when configured to use the Microsoft Java Virtual Machine.
- Do not use the "Never" option in Internet Explorer or Netscape Browser's Advanced Cache settings when running with Remote Admin. This option suppresses the browsers requests to get fresh pages and thus will result in out of date information being displayed. We recommend that you select "Update Pages" everytime or always.
- Web-based Remote Admin will not work properly if the "Remote Admin" folder inside your Default Web Folder is moved or renamed. Do not move, rename or delete the "Remote Admin" folder or its contents unless you are configuring your Web Server for multiple domains.
- If you have configured your Web Server to support multiple domains then you must move the Remote Admin folder from the Default Web Folder specified in the Web Settings panel to the "web folder" specified in the first entry of your Multi Domain Settings file. In order to access Remote Admin from the new location, you must use the host name or IP address specified in the first entry in your Multi Domain Settings file when entering the Remote Admin URL.
- When trying to access Remote Admin on a heavily loaded server, you may receive the "504 Gateway Timeout" message in your Web browser. Use the Web & File Admin application to set the Current User Activity to less than the maximum value to allow more processing time for the Remote Admin server application.
- When using Remote Admin with European keyboards on non-localized Mac OS systems, you must specify the appropriate settings for your keyboard in the Web browser. For Internet Explorer, check the Language/Fonts settings in your Internet Explorer Preferences. For the Netscape Browser, check the Encoding settings.
- When using Remote Admin with Japanese or European keyboards on Mac OS systems, you must specify the appropriate language and encoding settings in your Web Browser. From Microsoft Internet Explorer with MRJ 2.1.1 or later, choose Japanese Language with Shift-JIS character set for Japanese systems. Choose French or German Language with Western (Mac) character set for European systems. From the Netscape Browser, choose Japanese Language with Shift-JIS encoding for the Japanese system. Choose French or German language with Western (MacRoman) encoding for European systems.
- For this release of Web-based Remote Admin, administrators may only log on with 7 bit character passwords and may only set user passwords in this range. The 7 bit character range is the standard ASCII character set including the control characters, alphanumerics, and standard keyboard characters. You can continue to use Web & File Admin to set 8 bit passwords but administrators will not be able to use these passwords for log on to Remote Admin.
- Do not use the Reload button in Netscape to download a page in Remote Admin. You will have to logon again.
- A limitation in Netscape Java does not allow the 'caps lock' key to be recognized. A Remote Admin user should use the 'shift' key when

entering upper case letters in a password.

Documentation

- If you are experiencing any difficulty while printing the PDF documents that are included on the AppleShare IP 6.2 CD, increase the memory allocated to Adobe Acrobat(TM) application by 2MB.
- The AppleShare IP Help is html-based and uses the Apple Help Viewer browser application, which is included with your Mac OS 8.6 system software. Please note this browser may fail to launch the Help files if you change the name of the AppleShare IP Help folder (located in the Help folder within your System folder) or place the AppleShare IP Help folder inside another folder. The alias for the AppleShare IP Help inside the AppleShare IP 6.2 folder will still work.
- The AppleShare IP Remote Help incorrectly states that you can remove a printer assignment from a queued job using Remote Admin. You must use the AppleShare IP Print Admin to perform this function; it is unavailable remotely.

Upgrading to AppleShare IP 6.2

This document contains important information and upgrading instructions for AppleShare IP 6.2. You may want to print this document and keep it for future reference.

The 6.2 update of AppleShare IP provides several new features and enhancements, and fixes faults from previous releases. You must have a retail version 6.0 or 6.1 of AppleShare IP (not an AppleShare IP seed version) to install this update.

This article has been archived and is no longer updated by Apple.

New Features

- Mac OS 8.6 compatibility
- ability to share users and groups information between servers
- option to automatically create user home directories
- Sherlock indexing capabilities
- automatic hiding of non-accessible share points
- automatic mail database verification
- support for Realtime Blackhole List anti-spam
- support for remote POP account download
- a queue setting to place new print jobs on hold
- secure (non-password) LPD print queues for Windows clients

New System Requirements

The following additional system requirements are new with AppleShare IP 6.2. Previous system requirements still apply; see your AppleShare IP 6.0 (or 6.1) Getting Started manual for details.

- Any Apple Power Macintosh computer, iMac, or Macintosh Server with a PowerPC(TM) G3, 604e, 604, or 601 microprocessor, or a 6500 series computer with a 603e microprocessor
- 64 MB of physical random access memory (RAM) with virtual memory turned on (80 MB of RAM without virtual memory turned on) to run all of the AppleShare IP server programs simultaneously
- Mac OS 8.6

Installation Instructions

Preparing Your Computer

Before installing AppleShare IP 6.2, you need to make a copy of your System Folder. This allows you to restore a copy of the previous Users & Groups Data File and the AppleShare PDS file (an invisible file installed on every volume), and make it possible for you to switch back to your previous version of AppleShare IP if you desire. When you create your duplicate copy, make sure that the AppleShare IP Web & File Server is running.

Installing Mac OS 8.6 and AppleShare IP 6.2

If you are installing Mac OS 8.6 and AppleShare IP 6.2, be sure to install Mac OS 8.6 first following the instructions that come with that software. Then restart the computer with extensions off by holding down the Shift key while restarting.

To preserve your previous AppleShare IP and OpenDoc setup, it's recommended that you do not perform a clean installation of Mac OS 8.6.

If you choose to perform a clean installation of Mac OS 8.6 anyway, you must install Mac OS 8.6, then OpenDoc (available on the Mac OS 8.6 CD), then AppleShare IP 6.0 or 6.1. Then you need to restart the computer with extensions off by holding down the Shift key while restarting, and install the AppleShare IP 6.2 Update. You should then copy the file "Users & Groups Data File" from the Preferences folder in the backup copy of your System Folder to the Preferences folder inside your newly-created System Folder.

Installing AppleShare IP Software

To perform an installation, double-click the icon labeled Installer and follow the instructions onscreen. There is not a custom installation option.

Installing AppleShare 3.8.3 Client Software

To update client computers to AppleShare 3.8.3, see the AppleShare Client 3.8 User's Manual in the Client Software 3.8.3 folder on your hard disk. See your license agreement for the number of clients your AppleShare IP server may have.

Setting Up AppleShare IP

Using Easy Setup

You need to use the AppleShare IP Easy Setup program before you can use AppleShare IP. The program asks a few questions about how you plan to use AppleShare IP and sets up your AppleShare IP servers accordingly.

To use the Easy Setup program, double-click the Setup AppleShare IP icon on your computer desktop. Follow the instructions that appear onscreen. Your previous serial number appears automatically; you do not need to enter a new serial number.

If you need more help using the Easy Setup program, see your AppleShare IP 6.0 (or 6.1) Getting Started manual.

Setting Up Remote Admin for the First Time

To use the Web browser-based remote administration feature in AppleShare IP, you need to enable it in the Web & File Admin program. You also must be designated as an administrator in that program's Users & Group List.

For extra security, you can use TCP Filter software to allow access to the AppleShare IP Remote Admin application only from specific computers. See the TCP Filter section of AppleShare IP Help for details.

Follow these steps:

1. Click the Open Web & File Admin program button in the AppleShare IP Manager. Enter your name and password in the Administer Web & File Server dialog box, then click OK.
2. Make sure the Web & File server is running by checking the status line in the Web & File Server Activity window. If it's not running, choose Start Web & File Server from the Server menu.
3. Choose Web & File Server Settings from the Server menu.
4. Choose Web from the pop-up menu.
5. Select the "Allow remote administration via a Web browser" checkbox.
6. Make sure the Enable Web Service checkbox is selected.
7. Click Save.

Your changes take effect immediately. To administer your server remotely from any computer on the network, type the following URL in any industry-standard Web browser:

http://<your Web server's DNS name or TCP/IP address>/.admin

Setting Up Shared Users and Groups

If you've installed AppleShare IP on multiple servers and you want to perform all users and groups administration on one server, you can set up servers to get the latest users and groups information from a primary server. Setting up shared users and groups is optional.

Note: To install the same AppleShare IP service (Web & File Server, Print Server, or Mail Server) on more than one computer, you need to purchase a copy of AppleShare IP for each computer. For more information, see your license agreement.

You can share users and groups information with a maximum of 11 servers (10 secondary servers and 1 primary server). AppleShare IP uses industry-standard, high-security encryption methods to share users and groups information between servers.

See AppleShare IP Help for detailed instructions on setting up shared users and groups.
